

**MICROCHIP**

# PIC32MX1XX/2XX 28/36/44-PIN

## 32-bit Microcontrollers (up to 256 KB Flash and 64 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog

### Operating Conditions

- 2.3V to 3.6V, -40°C to +105°C, DC to 40 MHz
- 2.3V to 3.6V, -40°C to +85°C, DC to 50 MHz

### Core: 50 MHz/83 DMIPS MIPS32® M4K®

- MIPS16e® mode for up to 40% smaller code size
- Code-efficient (C and Assembly) architecture
- Single-cycle (MAC) 32x16 and two-cycle 32x32 multiply

### Clock Management

- 0.9% internal oscillator
- Programmable PLLs and oscillator clock sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timer
- Fast wake-up and start-up

### Power Management

- Low-power management modes (Sleep and Idle)
- Integrated Power-on Reset and Brown-out Reset
- 0.5 mA/MHz dynamic current (typical)
- 44 µA IPD current (typical)

### Audio Interface Features

- Data communication: I<sup>2</sup>S, LJ, RJ, and DSP modes
- Control interface: SPI and I<sup>2</sup>C
- Master clock:
  - Generation of fractional clock frequencies
  - Can be synchronized with USB clock
  - Can be tuned in run-time

### Advanced Analog Features

- ADC Module:
  - 10-bit 1.1 Msps rate with one S&H
  - Up to 10 analog inputs on 28-pin devices and 13 analog inputs on 44-pin devices
- Flexible and independent ADC trigger sources
- Charge Time Measurement Unit (CTMU):
  - Supports mTouch™ capacitive touch sensing
  - Provides high-resolution time measurement (1 ns)
  - On-chip temperature measurement capability
- Comparators:
  - Up to three Analog Comparator modules

- Programmable references with 32 voltage points

### Timers/Output Compare/Input Capture

- Five General Purpose Timers:
  - Five 16-bit and up to two 32-bit Timers/Counters
- Five Output Compare (OC) modules
- Five Input Capture (IC) modules
- Peripheral Pin Select (PPS) to allow function remap
- Real-Time Clock and Calendar (RTCC) module

### Communication Interfaces

- USB 2.0-compliant Full-speed OTG controller
- Two UART modules (12.5 Mbps):
  - Supports LIN 2.0 protocols and IrDA® support
- Two 4-wire SPI modules (25 Mbps)
- Two I<sup>2</sup>C modules (up to 1 Mbaud) with SMBus support
- PPS to allow function remap
- Parallel Master Port (PMP)

### Direct Memory Access (DMA)

- Four channels of hardware DMA with automatic data size detection
- Two additional channels dedicated for USB
- Programmable Cyclic Redundancy Check (CRC)

### Input/Output

- 10 mA source/sink on all I/O pins and up to 14 mA on non-standard V<sub>OH</sub>
- 5V-tolerant pins
- Selectable open drain, pull-ups, and pull-downs
- External interrupts on all I/O pins

### Class B Support

- Class B Safety Library, IEC 60730

### Debugger Development Support

- In-circuit and in-application programming
- 4-wire MIPS® Enhanced JTAG interface
- Unlimited program and six complex data breakpoints
- IEEE 1149.2-compatible (JTAG) boundary scan

### Packages

| Type               | SOIC            | SSOP       | SPDIP              | QFN     |         | VTLA    |         | TQFP    |
|--------------------|-----------------|------------|--------------------|---------|---------|---------|---------|---------|
| Pin Count          | 28              | 28         | 28                 | 28      | 44      | 36      | 44      | 44      |
| I/O Pins (up to)   | 21              | 21         | 21                 | 21      | 34      | 25      | 34      | 34      |
| Contact/Lead Pitch | 1.27            | 0.65       | 0.100"             | 0.65    | 0.65    | 0.50    | 0.50    | 0.80    |
| Dimensions         | 17.90x7.50x2.65 | 10.2x5.3x2 | 1.365"x.285"x.135" | 6x6x0.9 | 8x8x0.9 | 5x5x0.9 | 6x6x0.9 | 10x10x1 |

Note: All dimensions are in millimeters (mm) unless specified.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 1: PIC32MX1XX 28/36/44-PIN GENERAL PURPOSE FAMILY FEATURES**

| Device          | Pins | Program Memory (KB) <sup>(1)</sup> | Data Memory (KB) | Remappable Peripherals |  |      |                      |                                    | Analog Comparators | USB On-The-Go (OTG) | I <sup>2</sup> C | PMP | DMA Channels<br>(Programmable/Dedicated) | CTMU | 10-bit 1 Msps ADC (Channels) | RTCC | I/O Pins | JTAG | Packages               |

- Note 1:** This device features 3 KB of boot Flash memory.  
**2:** Four out of five timers are remappable.  
**3:** Four out of five external interrupts are remappable.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 2: PIC32MX2XX 28/36/44-PIN USB FAMILY FEATURES**

| Device          | Pins | Program Memory (KB) <sup>(1)</sup> | Data Memory (KB) | Remappable Peripherals |  |      |                      |                                    | Analog Comparators | USB On-The-Go (OTG) | I <sup>2</sup> C | PMP | DMA Channels<br>(Programmable/Dedicated) | CTMU | 10-bit 1 Mps ADC (Channels) | RTCC | I/O Pins | JTAG | Packages               |

- Note**
- 1: The RPN pins can be used by remappable peripherals. See [Table 1](#) for the available peripherals and [Section 11.3 "Peripheral Pin Select"](#) for restrictions.
  - 2: Every I/O port pin (RAX-RCX) can be used as a change notification pin (CNAX-CNCX). See [Section 11.0 "I/O Ports"](#) for more information.
  - 3: Shaded pins are 5V tolerant.

- Note**
- 1: The RPN pins can be used by remappable peripherals. See [Table 1](#) for the available peripherals and [Section 11.3 “Peripheral Pin Select”](#) for restrictions.
  - 2: Every I/O port pin (RAX-RCx) can be used as a change notification pin (CNAX-CNCx). See [Section 11.0 “I/O Ports”](#) for more information.
  - 3: The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to V<sub>SS</sub> externally.
  - 4: This pin function is not available on PIC32MX110F016D and PIC32MX120F032D devices.
  - 5: Shaded pins are 5V tolerant.

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

## 1.0 DEVICE OVERVIEW

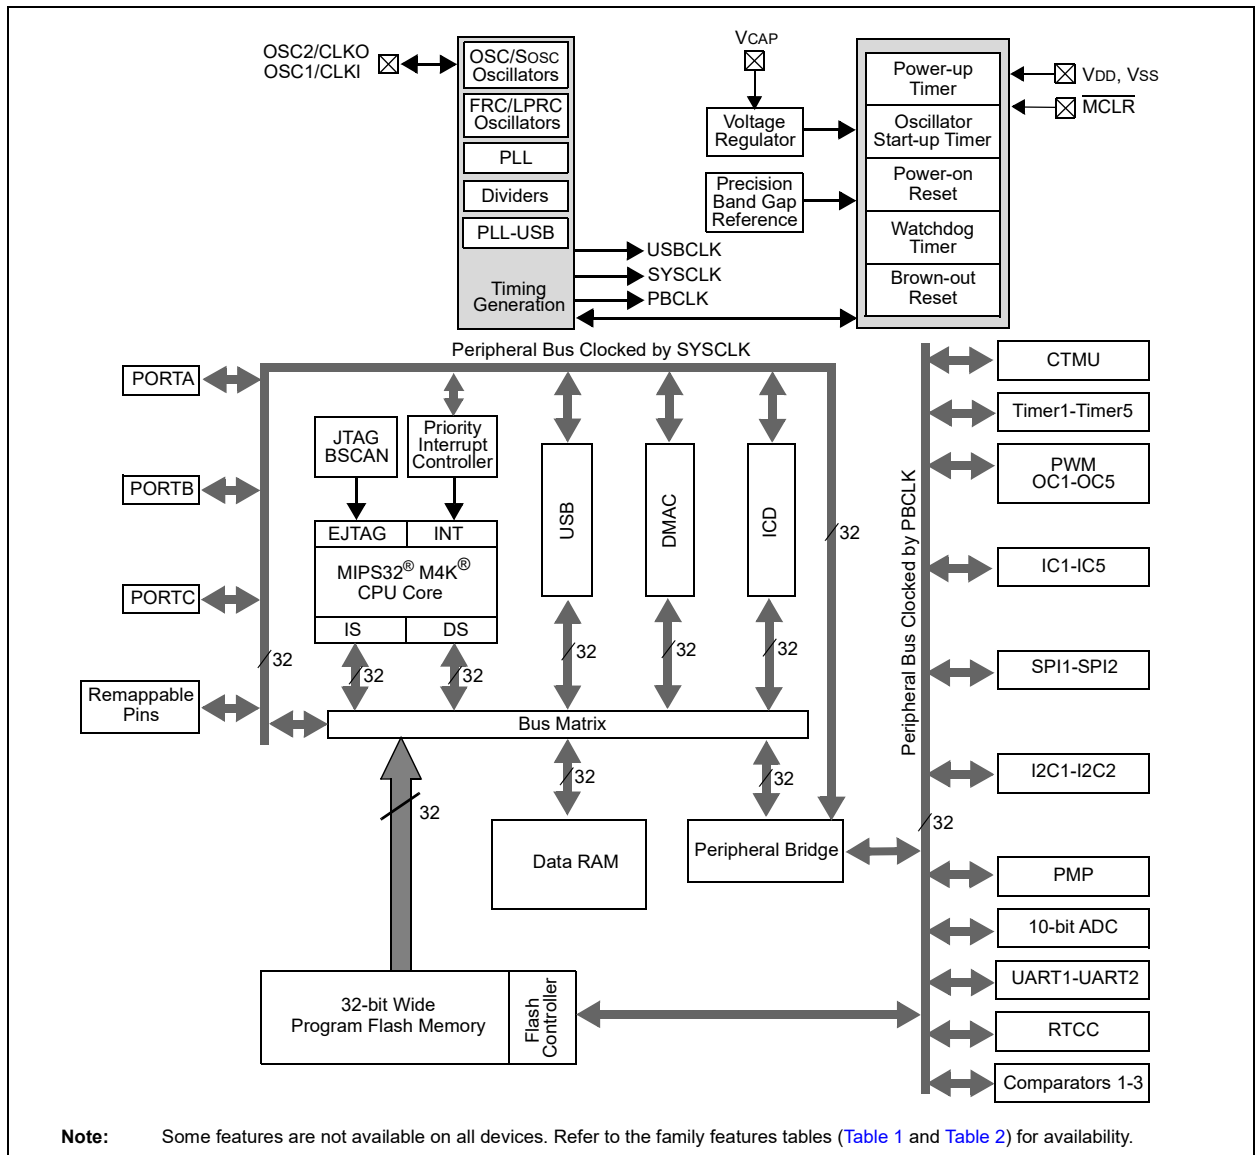

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to documents listed in the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

This document contains device-specific information for PIC32MX1XX/2XX 28/36/44-pin Family of devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MX1XX/2XX 28/36/44-pin Family of devices.

Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

**FIGURE 1-1: BLOCK DIAGRAM**

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MCUs

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the documents listed in the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

### 2.1 Basic Connection Requirements

Getting started with the PIC32MX1XX/2XX 28/36/44-pin Family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see [2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins, even if the ADC module is not used (see [2.2 “Decoupling Capacitors”](#))
- VCAP pin (see [2.3 “Capacitor on Internal Voltage Regulator \(VCAP\)”](#))
- MCLR pin (see [2.4 “Master Clear \(MCLR\) Pin”](#))
- PGECx/PGEDx pins, used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [2.5 “ICSP Pins”](#))
- OSC1 and OSC2 pins, when external oscillator source is used (see [2.7 “External Oscillator Pins”](#))

The following pins may be required:

- VREF+/VREF- pins – used when external voltage reference for the ADC module is implemented

**Note:** The AVDD and AVSS pins must be connected, regardless of ADC use and the ADC voltage reference source.

### 2.2 Decoupling Capacitors

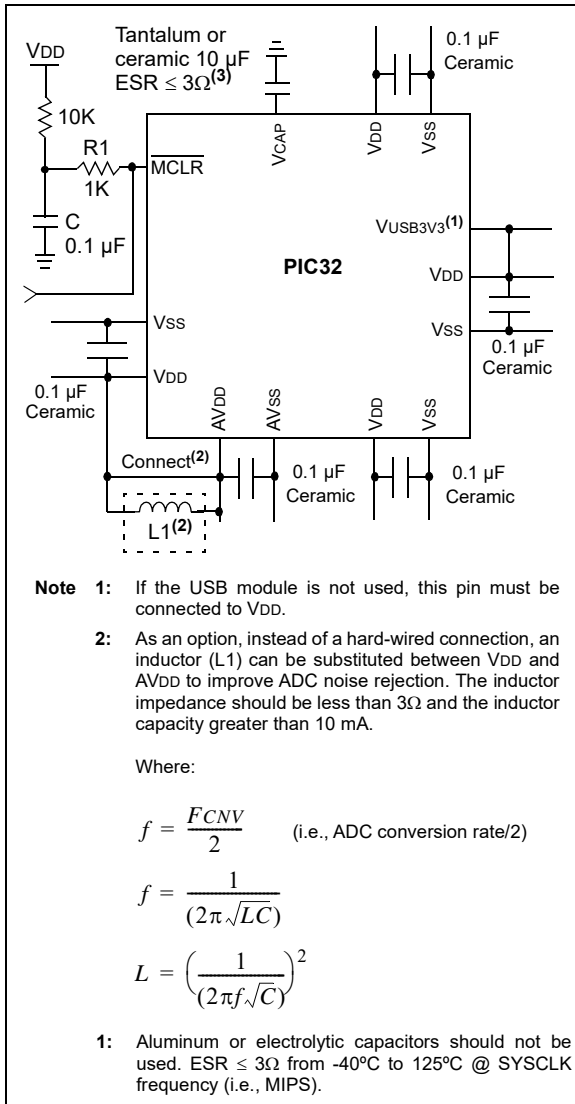

The use of decoupling capacitors on power supply pins, such as VDD, VSS, AVDD and AVSS is required. See [Figure 2-1](#).

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1  $\mu\text{F}$  (100 nF), 10-20V is recommended. The capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. It is further recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01  $\mu\text{F}$  to 0.001  $\mu\text{F}$ . Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1  $\mu\text{F}$  in parallel with 0.001  $\mu\text{F}$ .
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION**

## 2.2.1 BULK CAPACITORS

The use of a bulk capacitor is recommended to improve power supply stability. Typical values range from 4.7  $\mu\text{F}$  to 47  $\mu\text{F}$ . This capacitor should be located as close to the device as possible.

## 2.3 Capacitor on Internal Voltage Regulator (VCAP)

### 2.3.1 INTERNAL REGULATOR MODE

A low-ESR (3 ohm) capacitor is required on the VCAP pin, which is used to stabilize the internal voltage regulator output. The VCAP pin must not be connected to VDD, and must have a CEFC capacitor, with at least a 6V rating, connected to ground. The type can be ceramic or tantalum. Refer to [30.0 "Electrical Characteristics"](#) for additional information on CEFC specifications.

## 2.4 Master Clear ( $\overline{\text{MCLR}}$ ) Pin

The  $\overline{\text{MCLR}}$  pin provides two specific device functions:

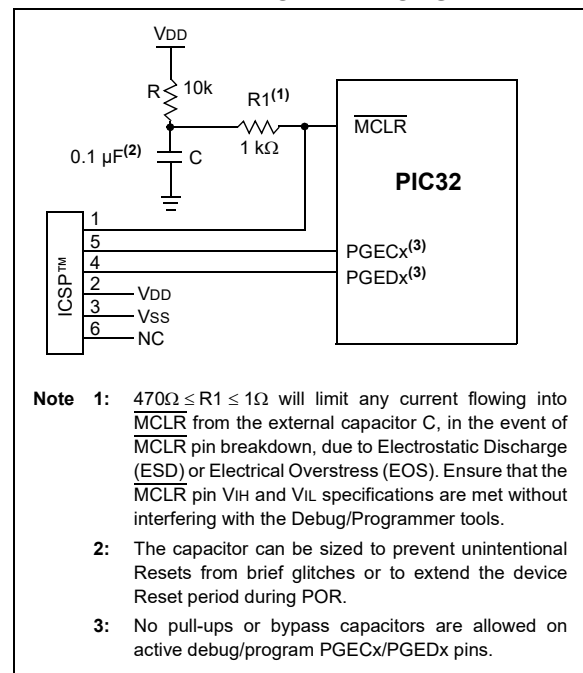

- Device Reset
- Device programming and debugging

Pulling The  $\overline{\text{MCLR}}$  pin low generates a device Reset. [Figure 2-2](#) illustrates a typical MCLR circuit. During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels ( $V_{IH}$  and  $V_{IL}$ ) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as illustrated in [Figure 2-2](#), it is recommended that the capacitor C, be isolated from the MCLR pin during programming and debugging operations.

Place the components illustrated in [Figure 2-2](#) within one-quarter inch (6 mm) from the MCLR pin.

**FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS**

## 2.5 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high ( $V_{IH}$ ) and input low ( $V_{IL}$ ) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 3 or MPLAB REAL ICE™.

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip web site:

- “Using MPLAB® ICD 3” (poster) (DS50001765)
- “MPLAB® ICD 3 Design Advisory” (DS50001764)
- “MPLAB® REAL ICE™ In-Circuit Debugger User’s Guide” (DS50001616)
- “Using MPLAB® REAL ICE™ Emulator” (poster) (DS50001749)

## 2.6 JTAG

The TMS, TDO, TDI and TCK pins are used for testing and debugging according to the Joint Test Action Group (JTAG) standard. It is recommended to keep the trace length between the JTAG connector and the JTAG pins on the device as short as possible. If the JTAG connector is expected to experience an ESD event, a series resistor is recommended with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

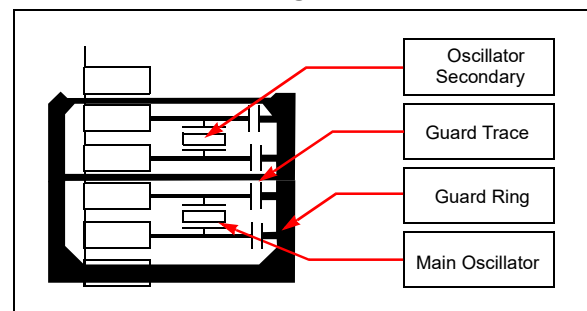

Pull-up resistors, series diodes and capacitors on the TMS, TDO, TDI and TCK pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high ( $V_{IH}$ ) and input low ( $V_{IL}$ ) requirements.

## 2.7 External Oscillator Pins

Many MCUs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to [Section 8.0 “Oscillator Configuration”](#) for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is illustrated in [Figure 2-3](#).

**FIGURE 2-3: SUGGESTED OSCILLATOR CIRCUIT PLACEMENT**

## 2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

Alternatively, inputs can be reserved by connecting the pin to  $V_{SS}$  through a 1k to 10k resistor and configuring the pin as an input.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 2.8.1 CRYSTAL OSCILLATOR DESIGN CONSIDERATION

The following example assumptions are used to calculate the Primary Oscillator loading capacitor values:

- $C_{IN}$  = PIC32\_OSC2\_Pin Capacitance = ~4-5 pF
- $C_{OUT}$  = PIC32\_OSC1\_Pin Capacitance = ~4-5 pF
- $C_1$  and  $C_2$  = XTAL manufacturing recommended loading capacitance
- Estimated PCB stray capacitance, (i.e., 12 mm length) = 2.5 pF

### EXAMPLE 2-1: CRYSTAL LOAD CAPACITOR CALCULATION

Crystal manufacturer recommended:  $C_1 = C_2 = 15 \text{ pF}$

Therefore:

$$\begin{aligned}
 C_{LOAD} &= \{ ([C_{IN} + C_1] * [C_{OUT} + C_2]) / [C_{IN} + C_1 + C_2 + C_{OUT}] \} \\
 &\quad + \text{estimated oscillator PCB stray capacitance} \\
 &= \{ ([5 + 15][5 + 15]) / [5 + 15 + 15 + 5] \} + 2.5 \text{ pF} \\
 &= \{ ([20][20]) / [40] \} + 2.5 \\
 &= 10 + 2.5 = 12.5 \text{ pF}
 \end{aligned}$$

Rounded to the nearest standard value or 12 pF in this example for Primary Oscillator crystals "C1" and "C2".

The following tips are used to increase oscillator gain, (i.e., to increase peak-to-peak oscillator signal):

- Select a crystal with a lower "minimum" power drive rating
- Select an crystal oscillator with a lower XTAL manufacturing "ESR" rating.
- Add a parallel resistor across the crystal. The smaller the resistor value the greater the gain. It is recommended to stay in the range of 600k to 1M
- $C_1$  and  $C_2$  values also affect the gain of the oscillator. The lower the values, the higher the gain.
- $C_2/C_1$  ratio also affects gain. To increase the gain, make  $C_1$  slightly smaller than  $C_2$ , which will also help start-up performance.

**Note:** Do not add excessive gain such that the oscillator signal is clipped, flat on top of the sine wave. If so, you need to reduce the gain or add a series resistor,  $R_S$ , as shown in circuit "C" in Figure 2-4. Failure to do so will stress and age the crystal, which can result in an early failure. Adjust the gain to trim the max peak-to-peak to  $\sim V_{DD} - 0.6V$ . When measuring the oscillator signal you must use a FET scope probe or a probe with  $\leq 1.5 \text{ pF}$  or the scope probe itself will unduly change the gain and peak-to-peak levels.

## 2.10 Considerations When Interfacing To Remotely Powered Circuits

### 2.10.1 NON-5V TOLERANT INPUT PINS

A quick review of the maximum rating section in the [Section 30.0 “Electrical Characteristics”](#) will indicate that the voltage on any non-5V tolerant pin should not exceed  $AVDD/VDD+0.3V$ . [Figure 2-7](#) illustrates a remote circuit using an independent power source that is powered while connected to a PIC32 non-5V tolerant circuit which is not powered.

**FIGURE 2-7: REMOTE CIRCUIT WITH AN INDEPENDENT POWER SOURCE**

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

Without proper signal isolation on non-5V tolerant pins, the remote signal can power the PIC32 through the high side ESD protection diodes. This violates the maximum rating specification and can cause improper initialization of internal PIC32 logic circuits. In this

case, it is recommended that users can implement a digital or analog signal isolation, as shown in Figure 2-8.

**FIGURE 2-8: DIGITAL AND ANALOG SIGNAL ISOLATION**

Digital signal isolators along with optional level translation examples are provided in Table 2-1.

**TABLE 2-1: EXAMPLES OF DIGITAL ISOLATORS WITH OPTIONAL LEVEL TRANSLATION**

|                             | Inductive Coupling | Capacitive Coupling | Optical Coupling | Analog/Digital Switch |

| ADuM7241 / 40 CRZ (25 Mbps) | X                  | -                   | -                | -                     |
| ISO721                      | -                  | X                   | -                | -                     |
| LTV-829S (2 Chan)           | -                  | -                   | X                | -                     |
| LTV-849S (4 Chan)           | -                  | -                   | -                | -                     |
| FSA266 / NC7WB66            | -                  | -                   | -                | X                     |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

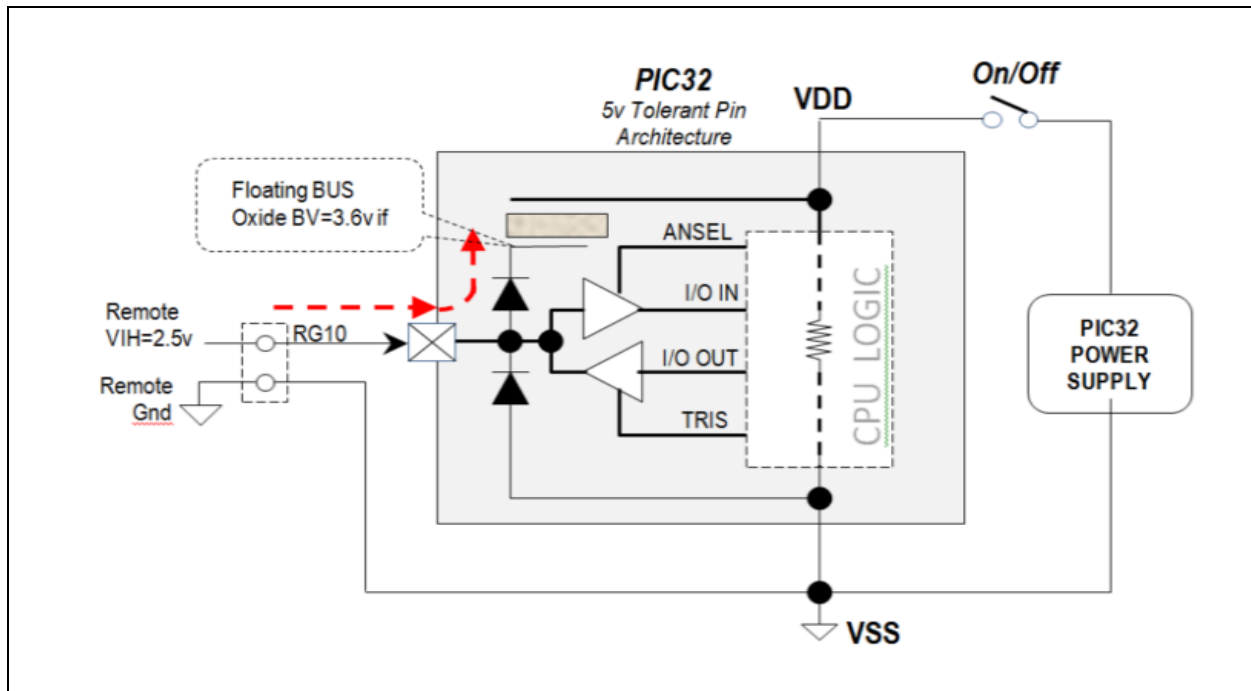

## 2.10.2 5V-TOLERANT INPUT PINS

The internal high-side diode on 5V-tolerant pins, rather than being connected to V<sub>DD</sub>, are bussed to an internal floating node, as shown in Figure 2-9. Voltages on these pins, if V<sub>DD</sub> < 2.3V, should not exceed roughly 3.2V relative to PIC32 V<sub>SS</sub>. At 3.6V or above, it will violate the absolute maximum specification and impact the device reliability.

If a remotely powered digital only signal can be guaranteed to always be  $\leq 3.2V$  relative to PIC32 V<sub>SS</sub>, then a 5V-tolerant pin can be used without a digital isolator. This can be assumed when the following is applicable:

- No ground loop issue
- The logic ground of the two circuits is not at the same absolute level
- No remote logic low inputs are less than V<sub>SS</sub> - 0.3V

FIGURE 2-9: 5V-TOLERANT INPUT PINS BUSSED TO AN INTERNAL FLOATING NODE

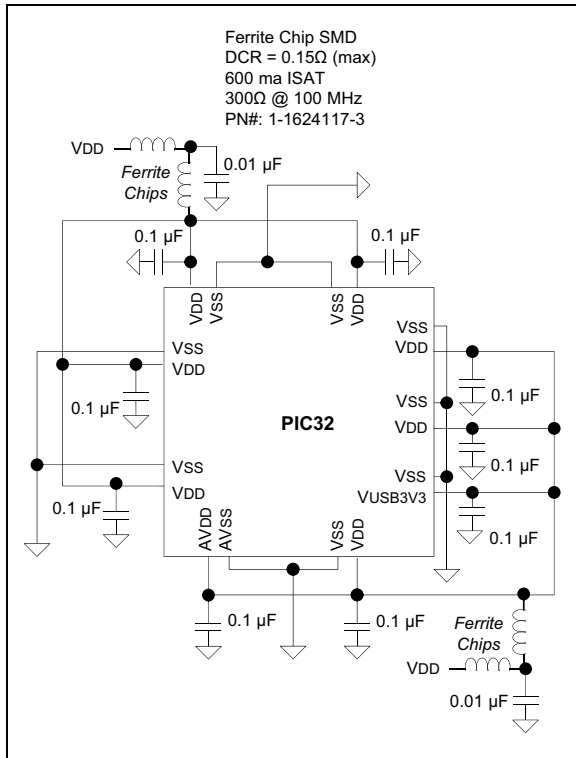

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 2.11 EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations

The use of LDO regulators is preferred to reduce overall system noise and provide a cleaner power source. However, when utilizing switching Buck/Boost regulators as the local power source for PIC32 devices, as well as in electrically noisy environments or test conditions required for IEC 61000-4-4 and IEC 61000-4-2, users should evaluate the use of T-Filters (i.e., L-C-L) on the power pins, as shown in Figure 2-10. In addition to a more stable power source, using this type of T-Filter can greatly reduce susceptibility to EMI sources and events.

## 3.0 CPU

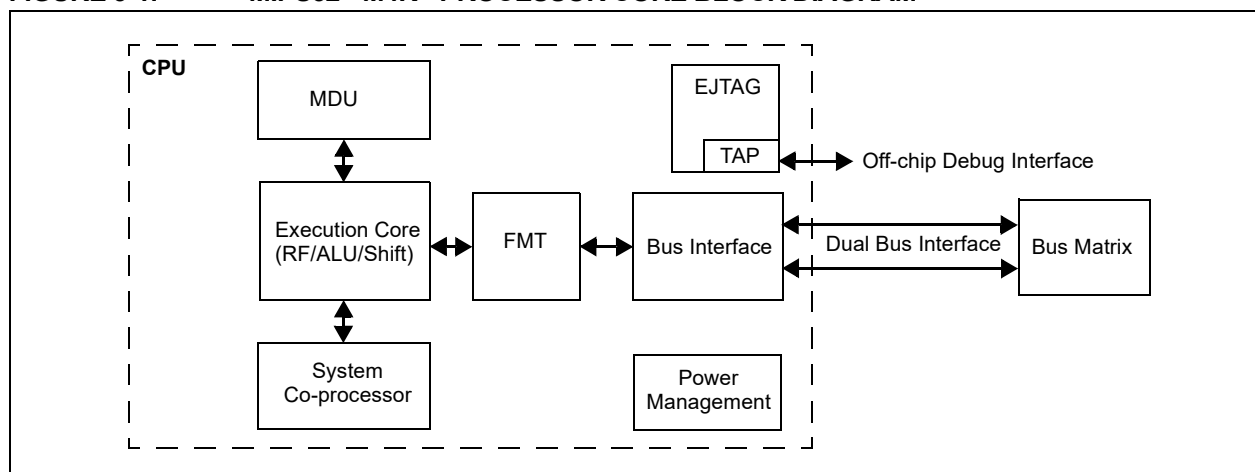

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 2. "CPU"** (DS60001113), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)). Resources for the MIPS32<sup>®</sup> M4K<sup>®</sup> Processor Core are available at: [www.imgtec.com](http://www.imgtec.com).

The MIPS32<sup>®</sup> M4K<sup>®</sup> Processor Core is the heart of the PIC32MX1XX/2XX family processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the destinations.

### 3.1 Features

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 2)
  - Multiply-accumulate and multiply-subtract instructions
  - Targeted multiply instruction
  - Zero/One detect instructions
  - WAIT instruction
  - Conditional move instructions (MOVN, MOVZ)
  - Vectored interrupts
  - Programmable exception vector base
  - Atomic interrupt enable/disable
  - Bit field manipulation instructions
- MIPS16e<sup>®</sup> code compression
  - 16-bit encoding of 32-bit instructions to improve code density
  - Special PC-relative instructions for efficient loading of addresses and constants
  - SAVE and RESTORE macro instructions for setting up and tearing down stack frames within subroutines
  - Improved support for handling 8 and 16-bit data types
- Simple Fixed Mapping Translation (FMT) mechanism
- Simple dual bus interface
  - Independent 32-bit address and data buses
  - Transactions can be aborted to improve interrupt latency
- Autonomous multiply/divide unit
  - Maximum issue rate of one 32x16 multiply per clock
  - Maximum issue rate of one 32x32 multiply every other clock
  - Early-in iterative divide. Minimum 11 and maximum 33 clock latency (dividend (rs) sign extension-dependent)
- Power control
  - Minimum frequency: 0 MHz
  - Low-Power mode (triggered by WAIT instruction)
  - Extensive use of local gated clocks
- EJTAG debug and instruction trace
  - Support for single stepping
  - Virtual instruction and data address/value
  - Breakpoints

**FIGURE 3-1: MIPS32<sup>®</sup> M4K<sup>®</sup> PROCESSOR CORE BLOCK DIAGRAM**

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 3.2 Architecture Overview

The MIPS32 M4K processor core contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution Unit
- Multiply/Divide Unit (MDU)
- System Control Coprocessor (CP0)
- Fixed Mapping Translation (FMT)
- Dual Internal Bus interfaces
- Power Management
- MIPS16e<sup>®</sup> Support
- Enhanced JTAG (EJTAG) Controller

### 3.2.1 EXECUTION UNIT

The MIPS32 M4K processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results
- Leading Zero/One detect unit for implementing the CLZ and CLO instructions
- Arithmetic Logic Unit (ALU) for performing bitwise logical operations
- Shifter and store aligner

### 3.2.2 MULTIPLY/DIVIDE UNIT (MDU)

The MIPS32 M4K processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x16 booth recoded multiplier, result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x16) represents the *rs* operand. The second number ('16' of 32x16) represents the *rt* operand. The PIC32 core only checks the value of the latter (*rt*) operand to determine how many times the operation must pass through the multiplier. The 16x16 and 32x16 operations pass through the multiplier once. A 32x32 operation passes through the multiplier twice.

The MDU supports execution of one 16x16 or 32x16 multiply operation every clock cycle; 32x32 multiply operations can be issued every other clock cycle. Appropriate interlocks are implemented to stall the issuance of back-to-back 32x32 multiply operations. The multiply operand size is automatically determined by logic built into the MDU.

Divide operations are implemented with a simple 1 bit per clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent MDU instruction while a divide is still active causes an IU pipeline stall until the divide operation is completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the PIC32 core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

**TABLE 3-1: MIPS32<sup>®</sup> M4K<sup>®</sup> PROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES**

| Opcode                             | Operand Size (mul <i>rt</i> ) (div <i>rs</i> ) | Latency | Repeat Rate |
|------------------------------------|--|---------|-------------|
| MULT/MULTU, MADD/MADDU, MSUB/MSUBU | 16 bits  | 1       | 1           |
|                                    | 32 bits  | 2       | 2           |
| MUL                                | 16 bits  | 2       | 1           |
|                                    | 32 bits  | 3       | 2           |
| DIV/DIVU                           | 8 bits   | 12      | 11          |
|                                    | 16 bits  | 19      | 18          |
|                                    | 24 bits  | 26      | 25          |
|                                    | 32 bits  | 33      | 32          |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

The MIPS architecture defines that the result of a multiply or divide operation be placed in the HI and LO registers. Using the Move-From-HI (MFHI) and Move-From-LO (MFLO) instructions, these values can be transferred to the General Purpose Register file.

In addition to the HI/LO targeted operations, the MIPS32<sup>®</sup> architecture also defines a multiply instruction, MUL, which places the least significant results in the primary register file instead of the HI/LO register pair. By avoiding the explicit MFLO instruction required when using the LO register, and by supporting multiple destination registers, the throughput of multiply-intensive operations is increased.

Two other instructions, Multiply-Add (MADD) and Multiply-Subtract (MSUB), are used to perform the multiply-accumulate and multiply-subtract operations. The MADD instruction multiplies two numbers and then

adds the product to the current contents of the HI and LO registers. Similarly, the MSUB instruction multiplies two operands and then subtracts the product from the HI and LO registers. The MADD and MSUB operations are commonly used in DSP algorithms.

## 3.2.3 SYSTEM CONTROL COPROCESSOR (CP0)

In the MIPS architecture, CP0 is responsible for the virtual-to-physical address translation, the exception control system, the processor's diagnostics capability, the operating modes (Kernel, User and Debug) and whether interrupts are enabled or disabled. Configuration information, such as presence of options like MIPS16e, is also available by accessing the CP0 registers, listed in Table 3-2.

**TABLE 3-2: COPROCESSOR 0 REGISTERS**

| Register Number | Register Name           | Function   |
|-----------------|-------------------------|--|
| 0-6             | Reserved                | Reserved in the PIC32MX1XX/2XX family core.                              |
| 7               | HWREna                  | Enables access via the RDHWR instruction to selected hardware registers. |
| 8               | BadVAddr <sup>(1)</sup> | Reports the address for the most recent address-related exception.       |
| 9               | Count <sup>(1)</sup>    | Processor cycle count.   |
| 10              | Reserved                | Reserved in the PIC32MX1XX/2XX family core.                              |
| 11              | Compare <sup>(1)</sup>  | Timer interrupt control.   |
| 12              | Status <sup>(1)</sup>   | Processor status and control.  |
| 12              | IntCtl <sup>(1)</sup>   | Interrupt system status and control.                                     |
| 12              | SRSCtl <sup>(1)</sup>   | Shadow register set status and control.                                  |
| 12              | SRSSMap <sup>(1)</sup>  | Provides mapping from vectored interrupt to a shadow set.                |
| 13              | Cause <sup>(1)</sup>    | Cause of last general exception.   |
| 14              | EPC <sup>(1)</sup>      | Program counter at last exception.                                       |
| 15              | PRId                    | Processor identification and revision.                                   |
| 15              | EBASE                   | Exception vector base register.  |
| 16              | Config                  | Configuration register.  |
| 16              | Config1                 | Configuration Register 1.  |
| 16              | Config2                 | Configuration Register 2.  |
| 16              | Config3                 | Configuration Register 3.  |
| 17-22           | Reserved                | Reserved in the PIC32MX1XX/2XX family core.                              |
| 23              | Debug <sup>(2)</sup>    | Debug control and exception status.                                      |
| 24              | DEPC <sup>(2)</sup>     | Program counter at last debug exception.                                 |
| 25-29           | Reserved                | Reserved in the PIC32MX1XX/2XX family core.                              |
| 30              | ErrorEPC <sup>(1)</sup> | Program counter at last error.   |
| 31              | DESAVE <sup>(2)</sup>   | Debug handler scratchpad register.                                       |

**Note 1:** Registers used in exception processing.

**2:** Registers used during debug.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

Coprocessor 0 also contains the logic for identifying and managing exceptions. Exceptions can be caused by a variety of sources, including alignment errors in data, external events or program errors. [Table 3-3](#) lists the exception types in order of priority.

**TABLE 3-3: MIPS32® M4K® PROCESSOR CORE EXCEPTION TYPES**

| Exception | Description  |
|-----------|--|
| Reset     | Assertion $\overline{\text{MCLR}}$ or a Power-on Reset (POR).  |
| DSS       | EJTAG debug single step.   |
| DINT      | EJTAG debug interrupt. Caused by the assertion of the external <i>EJ_DINT</i> input or by setting the <i>EjtagBrk</i> bit in the ECR register. |
| NMI       | Assertion of NMI signal.   |
| Interrupt | Assertion of unmasked hardware or software interrupt signal.   |
| DIB       | EJTAG debug hardware instruction break matched.  |
| AdEL      | Fetch address alignment error.<br>Fetch reference to protected address.  |
| IBE       | Instruction fetch bus error.   |
| DBp       | EJTAG breakpoint (execution of <i>SDBBP</i> instruction).  |
| Sys       | Execution of <i>SYSCALL</i> instruction.   |
| Bp        | Execution of <i>BREAK</i> instruction.   |
| RI        | Execution of a reserved instruction.   |
| CpU       | Execution of a coprocessor instruction for a coprocessor that is not enabled.  |
| CEU       | Execution of a <i>CorExtend</i> instruction when <i>CorExtend</i> is not enabled.  |
| Ov        | Execution of an arithmetic instruction that overflowed.  |
| Tr        | Execution of a trap (when trap condition is true).   |
| DDBL/DDBS | EJTAG Data Address Break (address only) or EJTAG data value break on store (address + value).  |
| AdEL      | Load address alignment error.<br>Load reference to protected address.  |
| AdES      | Store address alignment error.<br>Store to protected address.  |
| DBE       | Load or store bus error.   |
| DDBL      | EJTAG data hardware breakpoint matched in load data compare.   |

## 3.3 Power Management

The MIPS M4K processor core offers many power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or Halting the clocks, which reduces system power consumption during Idle periods.

### 3.3.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the *WAIT* instruction. For more information on power management, see [Section 26.0 “Power-Saving Features”](#).

## 3.4 EJTAG Debug Support

The MIPS M4K processor core provides an Enhanced JTAG (EJTAG) interface for use in the software debug of application and kernel code. In addition to standard User mode and Kernel modes of operation, the M4K core provides a Debug mode that is entered after a debug exception (derived from a hardware breakpoint, single-step exception, etc.) is taken and continues until a Debug Exception Return (*DERET*) instruction is executed. During this time, the processor executes the debug exception handler routine.

The EJTAG interface operates through the Test Access Port (TAP), a serial communication port used for transferring test data in and out of the core. In addition to the standard JTAG instructions, special instructions defined in the EJTAG specification define which registers are selected and how they are used.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 4.0 MEMORY ORGANIZATION

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. For detailed information, refer to **Section 3. “Memory Organization”** (DS60001115), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

PIC32MX1XX/2XX 28/36/44-pin Family microcontrollers provide 4 GB unified virtual memory address space. All memory regions, including program, data memory, Special Function Registers (SFRs), and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, the data memory can be made executable, allowing PIC32MX1XX/2XX 28/36/44-pin Family devices to execute from data memory.

Key features include:

- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/KSEG1) mode address space
- Flexible program Flash memory partitioning
- Flexible data RAM partitioning for data and program space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Simple memory mapping with Fixed Mapping Translation (FMT) unit
- Cacheable (KSEG0) and non-cacheable (KSEG1) address regions

## 4.1 PIC32MX1XX/2XX 28/36/44-pin Family Memory Layout

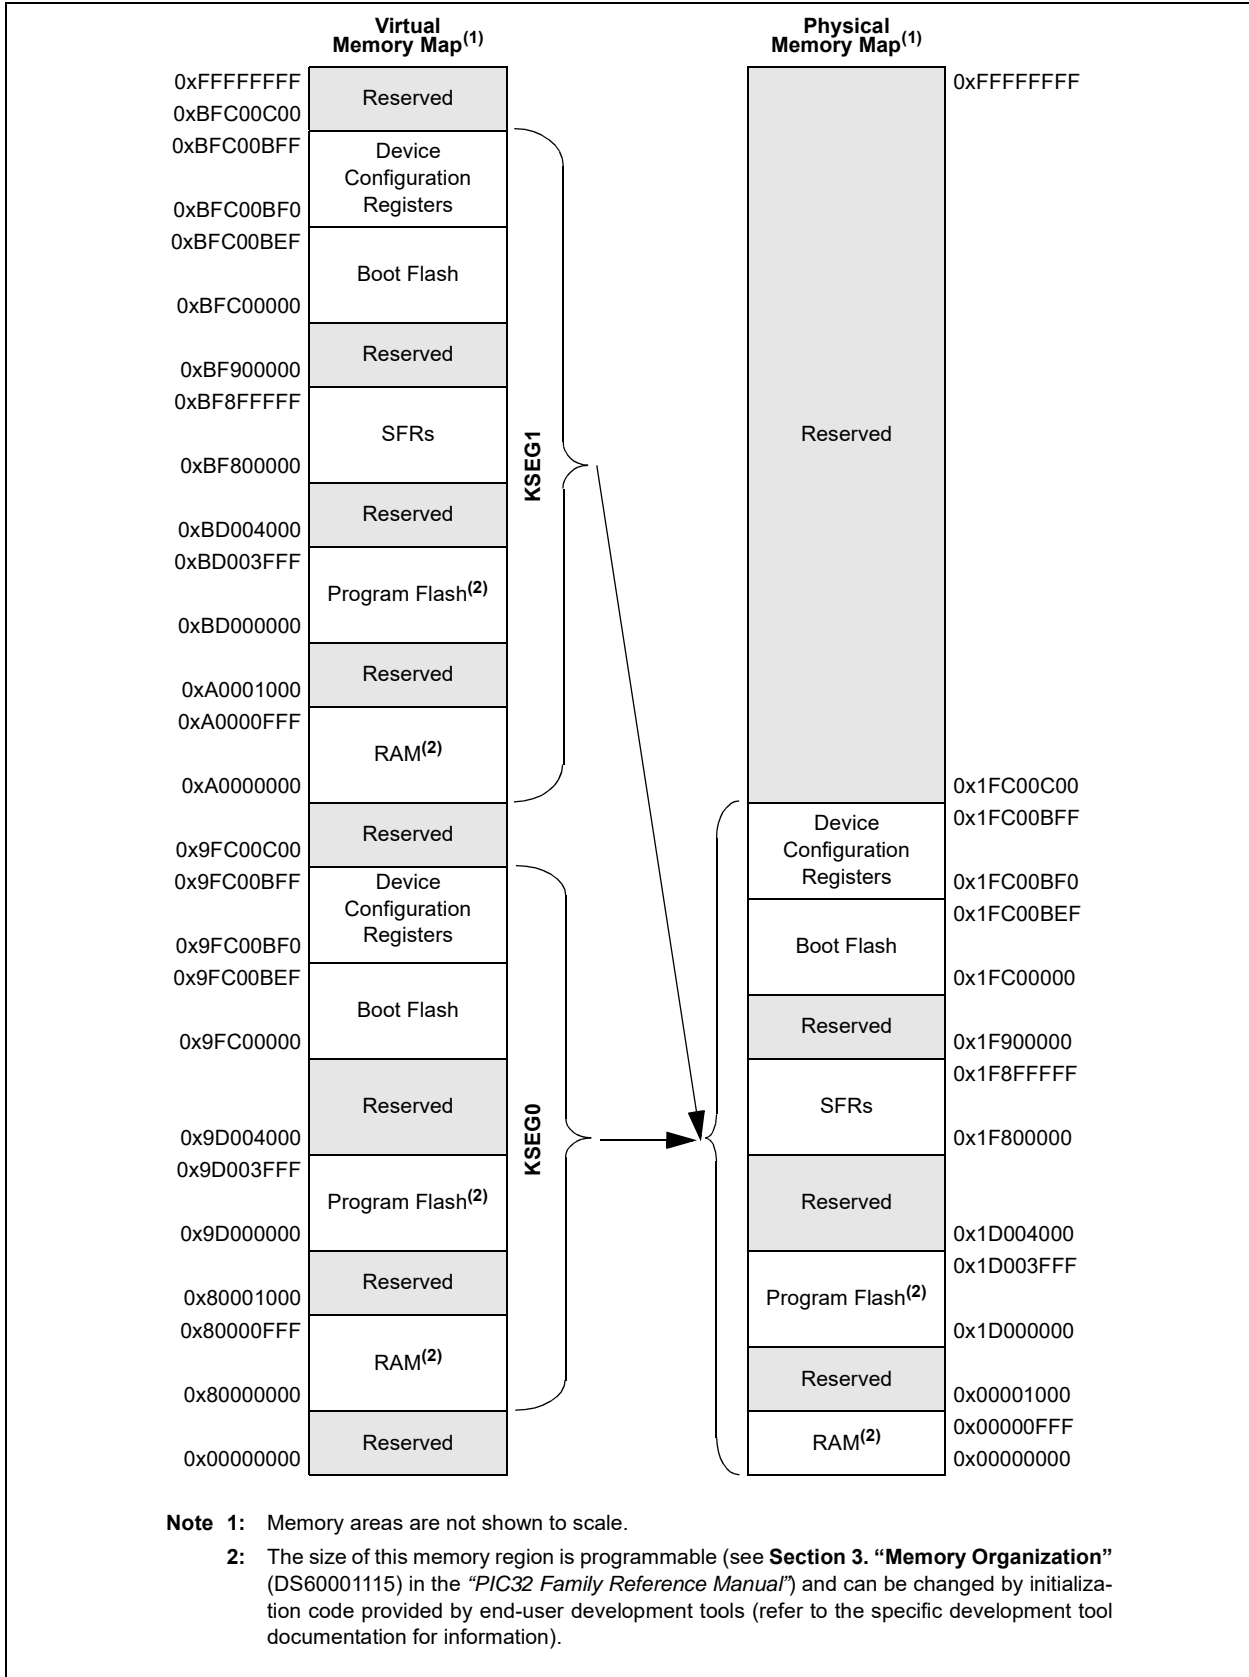

PIC32MX1XX/2XX 28/36/44-pin Family microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus master peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

The memory maps for the PIC32MX1XX/2XX 28/36/44-pin Family devices are illustrated in [Figure 4-1](#) through [Figure 4-6](#).

[Table 4-1](#) provides SFR memory map details.

## 5.0 FLASH PROGRAM MEMORY

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 5. “Flash Program Memory”** (DS60001121), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

PIC32MX1XX/2XX 28/36/44-pin Family devices contain an internal Flash program memory for executing user code. There are three methods by which the user can program this memory:

- Run-Time Self-Programming (RTSP)
- EJTAG Programming
- In-Circuit Serial Programming™ (ICSP™)

RTSP is performed by software executing from either Flash or RAM memory. Information about RTSP techniques is available in **Section 5. “Flash Program Memory”** (DS60001121) in the *“PIC32 Family Reference Manual”*.

EJTAG is performed using the EJTAG port of the device and an EJTAG capable programmer.

ICSP is performed using a serial data connection to the device and allows much faster programming times than RTSP.

The EJTAG and ICSP methods are described in the *“PIC32 Flash Programming Specification”* (DS60001145), which can be downloaded from the Microchip web site.

**Note:** The Flash page size on PIC32MX-1XX/2XX 28/36/44-pin Family devices is 1 KB and the row size is 128 bytes (256 IW and 32 IW, respectively).

**Legend:**

|                   |                  |                                    |
|-------------------|------------------|------------------------------------|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared               |
|                   |                  | x = Bit is unknown                 |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **WR:** Write Control bit

This bit is writable when WREN = 1 and the unlock sequence is followed.

1 = Initiate a Flash operation. Hardware clears this bit when the operation completes

0 = Flash operation is complete or inactive

bit 14 **WREN:** Write Enable bit

This is the only bit in this register reset by a device Reset.

1 = Enable writes to WR bit and enables LVD circuit

0 = Disable writes to WR bit and disables LVD circuit

bit 13 **WRERR:** Write Error bit<sup>(1)</sup>

This bit is read-only and is automatically set by hardware.

1 = Program or erase sequence did not complete successfully

0 = Program or erase sequence completed normally

bit 12 **LVDERR:** Low-Voltage Detect Error bit (LVD circuit must be enabled)<sup>(1)</sup>

This bit is read-only and is automatically set by hardware.

1 = Low-voltage detected (possible data corruption, if WRERR is set)

0 = Voltage level is acceptable for programming

bit 11 **LVDSTAT:** Low-Voltage Detect Status bit (LVD circuit must be enabled)<sup>(1)</sup>

This bit is read-only and is automatically set and cleared by the hardware.

1 = Low-voltage event is active

0 = Low-voltage event is not active

bit 10-4 **Unimplemented:** Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation bits

These bits are writable when WREN = 0.

1111 = Reserved

.

.

.

0111 = Reserved

0110 = No operation

0101 = Program Flash Memory (PFM) erase operation: erases PFM, if all pages are not write-protected

0100 = Page erase operation: erases page selected by NVMADDR, if it is not write-protected

0011 = Row program operation: programs row selected by NVMADDR, if it is not write-protected

0010 = No operation

0001 = Word program operation: programs word selected by NVMADDR, if it is not write-protected

0000 = No operation

**Note 1:** This bit is cleared by setting NVMOP == 'b0000, and initiating a Flash operation (i.e., WR).

NOTES:

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 6.0 RESETS

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Resets"** (DS60001118), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The following is a list of device Reset sources:

- Power-on Reset (POR)
- Master Clear Reset pin ( $\overline{\text{MCLR}}$ )
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Brown-out Reset (BOR)
- Configuration Mismatch Reset (CMR)

A simplified block diagram of the Reset module is illustrated in [Figure 6-1](#).

**FIGURE 6-1: SYSTEM RESET BLOCK DIAGRAM**

| F610                     | RSWRST                       | 15:0      | —     | —     | —     | —     | —     | —     | —    | —    | —    | —    | —    | —    | —    | —    | —    | —    | —          | xxxx <sup>(2)</sup> |
|                          |                              | 31:16     | —     | —     | —     | —     | —     | —     | —    | —    | —    | —    | —    | —    | —    | —    | —    | —    | —          | 0000                |
|                          |                              | 15:0      | —     | —     | —     | —     | —     | —     | —    | —    | —    | —    | —    | —    | —    | —    | —    | —    | —          | 0000                |

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 11.2 “CLR, SET and INV Registers” for more information.

**2:** Reset values are dependent on the DEVCFGx Configuration bits and the type of reset.

|-------------------|------------------------------------|
| <b>Legend:</b>    | HS = Set by hardware               |
| R = Readable bit  | W = Writable bit                   |
| -n = Value at POR | '1' = Bit is set                   |
|                   | U = Unimplemented bit, read as '0' |
|                   | '0' = Bit is cleared               |
|                   | x = Bit is unknown                 |

bit 31-10 **Unimplemented:** Read as '0'

bit 9 **CMR:** Configuration Mismatch Reset Flag bit  
 1 = Configuration mismatch Reset has occurred  
 0 = Configuration mismatch Reset has not occurred

bit 8 **VREGS:** Voltage Regulator Standby Enable bit  
 1 = Regulator is enabled and is on during Sleep mode  
 0 = Regulator is set to standby tracking mode

bit 7 **EXTR:** External Reset ( $\overline{\text{MCLR}}$ ) Pin Flag bit  
 1 = Master Clear (pin) Reset has occurred  
 0 = Master Clear (pin) Reset has not occurred

bit 6 **SWR:** Software Reset Flag bit  
 1 = Software Reset was executed  
 0 = Software Reset as not executed

bit 5 **Unimplemented:** Read as '0'

bit 4 **WDTO:** Watchdog Timer Time-out Flag bit  
 1 = WDT Time-out has occurred  
 0 = WDT Time-out has not occurred

bit 3 **SLEEP:** Wake From Sleep Flag bit  
 1 = Device was in Sleep mode  
 0 = Device was not in Sleep mode

bit 2 **IDLE:** Wake From Idle Flag bit  
 1 = Device was in Idle mode  
 0 = Device was not in Idle mode

bit 1 **BOR:** Brown-out Reset Flag bit<sup>(1)</sup>  
 1 = Brown-out Reset has occurred  
 0 = Brown-out Reset has not occurred

bit 0 **POR:** Power-on Reset Flag bit<sup>(1)</sup>  
 1 = Power-on Reset has occurred  
 0 = Power-on Reset has not occurred

**Note 1:** User software must clear this bit to view next detection.

|                   |  |
|-------------------|--|
| <b>Legend:</b>    | HC = Cleared by hardware   |
| R = Readable bit  | W = Writable bit      U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set      '0' = Bit is cleared      x = Bit is unknown |

- bit 31-1 **Unimplemented:** Read as '0'
- bit 0 **SWRST:** Software Reset Trigger bit<sup>(1)</sup>
  - 1 = Enable Software Reset event
  - 0 = No effect

**Note 1:** The system unlock sequence must be performed before the SWRST bit is written. Refer to **Section 6. "Oscillator"** (DS60001112) in the *"PIC32 Family Reference Manual"* for details.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 7.0 INTERRUPT CONTROLLER

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. “Interrupt Controller”** (DS60001108), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

PIC32MX1XX/2XX 28/36/44-pin Family devices generate interrupt requests in response to interrupt events from peripheral modules. The interrupt control module exists externally to the CPU logic and prioritizes the interrupt events before presenting them to the CPU.

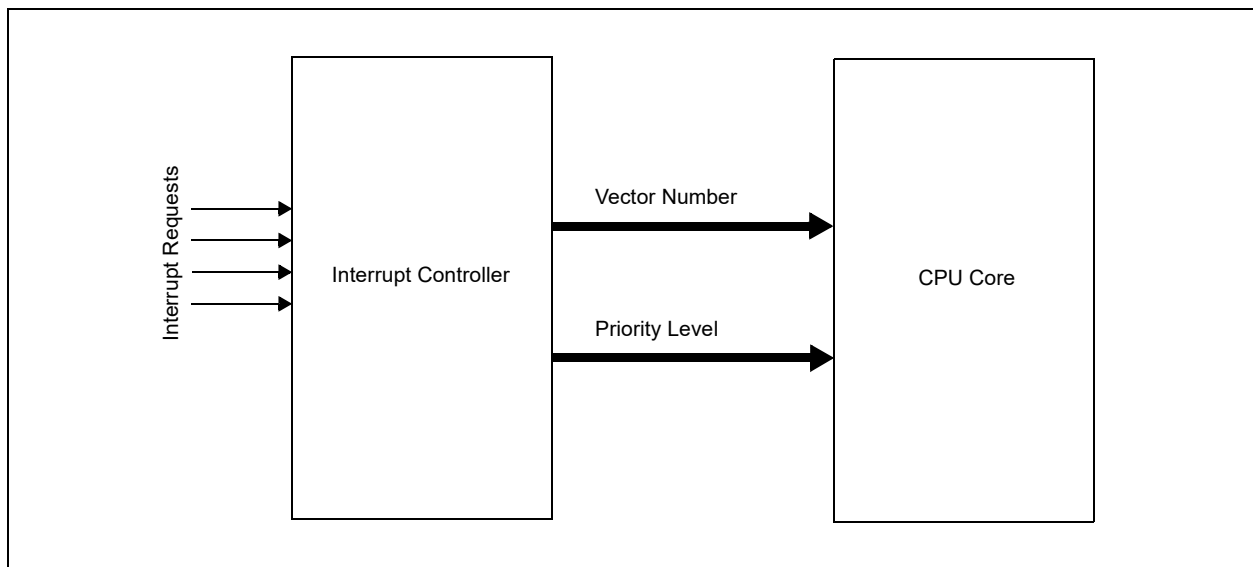

The PIC32MX1XX/2XX 28/36/44-pin Family interrupt module includes the following features:

- Up to 64 interrupt sources
- Up to 44 interrupt vectors
- Single and multi-vector mode operations
- Five external interrupts with edge polarity control
- Interrupt proximity timer
- Seven user-selectable priority levels for each vector
- Four user-selectable subpriority levels within each priority
- Software can generate any interrupt
- User-configurable Interrupt Vector Table (IVT) location
- User-configurable interrupt vector spacing

**Note:** The dedicated shadow register set is not present on PIC32MX1XX/2XX 28/36/44-pin Family devices.

A simplified block diagram of the Interrupt Controller module is illustrated in [Figure 7-1](#).

**FIGURE 7-1: INTERRUPT CONTROLLER MODULE BLOCK DIAGRAM**

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 7-1: INTERRUPT IRQ, VECTOR AND BIT LOCATION**

| Interrupt Source <sup>(1)</sup>     | IRQ # | Vector # | Interrupt Bit Location |          |             |              | Persistent Interrupt |
|-------------------------------------|-------|----------|------------------------|----------|-------------|--------------|----------------------|
|                                     |       |          | Flag                   | Enable   | Priority    | Sub-priority |                      |
| Highest Natural Order Priority      |       |          |                        |          |             |              |                      |
| CT – Core Timer Interrupt           | 0     | 0        | IFS0<0>                | IEC0<0>  | IPC0<4:2>   | IPC0<1:0>    | No                   |
| CS0 – Core Software Interrupt 0     | 1     | 1        | IFS0<1>                | IEC0<1>  | IPC0<12:10> | IPC0<9:8>    | No                   |

| IC5 – Input Capture 5               | 26    | 21       | IFS0<26>               | IEC0<26> | IPC5<12:10> | IPC5<9:8>    | Yes                  |
| OC5 – Output Compare 5              | 27    | 22       | IFS0<27>               | IEC0<27> | IPC5<20:18> | IPC5<17:16>  | No                   |
| AD1 – ADC1 Convert done             | 28    | 23       | IFS0<28>               | IEC0<28> | IPC5<28:26> | IPC5<25:24>  | Yes                  |
| FSCM – Fail-Safe Clock Monitor      | 29    | 24       | IFS0<29>               | IEC0<29> | IPC6<4:2>   | IPC6<1:0>    | No                   |
| RTCC – Real-Time Clock and Calendar | 30    | 25       | IFS0<30>               | IEC0<30> | IPC6<12:10> | IPC6<9:8>    | No                   |
| FCE – Flash Control Event           | 31    | 26       | IFS0<31>               | IEC0<31> | IPC6<20:18> | IPC6<17:16>  | No                   |
| CMP1 – Comparator Interrupt         | 32    | 27       | IFS1<0>                | IEC1<0>  | IPC6<28:26> | IPC6<25:24>  | No                   |
| CMP2 – Comparator Interrupt         | 33    | 28       | IFS1<1>                | IEC1<1>  | IPC7<4:2>   | IPC7<1:0>    | No                   |
| CMP3 – Comparator Interrupt         | 34    | 29       | IFS1<2>                | IEC1<2>  | IPC7<12:10> | IPC7<9:8>    | No                   |
| USB – USB Interrupts                | 35    | 30       | IFS1<3>                | IEC1<3>  | IPC7<20:18> | IPC7<17:16>  | Yes                  |
| SPI1E – SPI1 Fault                  | 36    | 31       | IFS1<4>                | IEC1<4>  | IPC7<28:26> | IPC7<25:24>  | Yes                  |
| SPI1RX – SPI1 Receive Done          | 37    | 31       | IFS1<5>                | IEC1<5>  | IPC7<28:26> | IPC7<25:24>  | Yes                  |
| SPI1TX – SPI1 Transfer Done         | 38    | 31       | IFS1<6>                | IEC1<6>  | IPC7<28:26> | IPC7<25:24>  | Yes                  |

**Note 1:** Not all interrupt sources are available on all devices. See [TABLE 1: “PIC32MX1XX 28/36/44-Pin General Purpose Family Features”](#) and [TABLE 2: “PIC32MX2XX 28/36/44-pin USB Family Features”](#) for the lists of available peripherals.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 7-1: INTERRUPT IRQ, VECTOR AND BIT LOCATION (CONTINUED)**

| Interrupt Source <sup>(1)</sup>    | IRQ # | Vector # | Interrupt Bit Location |          |              |              | Persistent Interrupt |
|------------------------------------|-------|----------|------------------------|----------|--------------|--------------|----------------------|
|                                    |       |          | Flag                   | Enable   | Priority     | Sub-priority |                      |
| U1E – UART1 Fault                  | 39    | 32       | IFS1<7>                | IEC1<7>  | IPC8<4:2>    | IPC8<1:0>    | Yes                  |
| U1RX – UART1 Receive Done          | 40    | 32       | IFS1<8>                | IEC1<8>  | IPC8<4:2>    | IPC8<1:0>    | Yes                  |
| U1TX – UART1 Transfer Done         | 41    | 32       | IFS1<9>                | IEC1<9>  | IPC8<4:2>    | IPC8<1:0>    | Yes                  |
| I2C1B – I2C1 Bus Collision Event   | 42    | 33       | IFS1<10>               | IEC1<10> | IPC8<12:10>  | IPC8<9:8>    | Yes                  |
| I2C1S – I2C1 Slave Event           | 43    | 33       | IFS1<11>               | IEC1<11> | IPC8<12:10>  | IPC8<9:8>    | Yes                  |
| I2C1M – I2C1 Master Event          | 44    | 33       | IFS1<12>               | IEC1<12> | IPC8<12:10>  | IPC8<9:8>    | Yes                  |
| CNA – PORTA Input Change Interrupt | 45    | 34       | IFS1<13>               | IEC1<13> | IPC8<20:18>  | IPC8<17:16>  | Yes                  |
| CNB – PORTB Input Change Interrupt | 46    | 34       | IFS1<14>               | IEC1<14> | IPC8<20:18>  | IPC8<17:16>  | Yes                  |
| CNC – PORTC Input Change Interrupt | 47    | 34       | IFS1<15>               | IEC1<15> | IPC8<20:18>  | IPC8<17:16>  | Yes                  |
| PMP – Parallel Master Port         | 48    | 35       | IFS1<16>               | IEC1<16> | IPC8<28:26>  | IPC8<25:24>  | Yes                  |
| PMPE – Parallel Master Port Error  | 49    | 35       | IFS1<17>               | IEC1<17> | IPC8<28:26>  | IPC8<25:24>  | Yes                  |
| SPI2E – SPI2 Fault                 | 50    | 36       | IFS1<18>               | IEC1<18> | IPC9<4:2>    | IPC9<1:0>    | Yes                  |
| SPI2RX – SPI2 Receive Done         | 51    | 36       | IFS1<19>               | IEC1<19> | IPC9<4:2>    | IPC9<1:0>    | Yes                  |
| SPI2TX – SPI2 Transfer Done        | 52    | 36       | IFS1<20>               | IEC1<20> | IPC9<4:2>    | IPC9<1:0>    | Yes                  |
| U2E – UART2 Error                  | 53    | 37       | IFS1<21>               | IEC1<21> | IPC9<12:10>  | IPC9<9:8>    | Yes                  |
| U2RX – UART2 Receiver              | 54    | 37       | IFS1<22>               | IEC1<22> | IPC9<12:10>  | IPC9<9:8>    | Yes                  |
| U2TX – UART2 Transmitter           | 55    | 37       | IFS1<23>               | IEC1<23> | IPC9<12:10>  | IPC9<9:8>    | Yes                  |
| I2C2B – I2C2 Bus Collision Event   | 56    | 38       | IFS1<24>               | IEC1<24> | IPC9<20:18>  | IPC9<17:16>  | Yes                  |
| I2C2S – I2C2 Slave Event           | 57    | 38       | IFS1<25>               | IEC1<25> | IPC9<20:18>  | IPC9<17:16>  | Yes                  |
| I2C2M – I2C2 Master Event          | 58    | 38       | IFS1<26>               | IEC1<26> | IPC9<20:18>  | IPC9<17:16>  | Yes                  |
| CTMU – CTMU Event                  | 59    | 39       | IFS1<27>               | IEC1<27> | IPC9<28:26>  | IPC9<25:24>  | Yes                  |
| DMA0 – DMA Channel 0               | 60    | 40       | IFS1<28>               | IEC1<28> | IPC10<4:2>   | IPC10<1:0>   | No                   |
| DMA1 – DMA Channel 1               | 61    | 41       | IFS1<29>               | IEC1<29> | IPC10<12:10> | IPC10<9:8>   | No                   |
| DMA2 – DMA Channel 2               | 62    | 42       | IFS1<30>               | IEC1<30> | IPC10<20:18> | IPC10<17:16> | No                   |
| DMA3 – DMA Channel 3               | 63    | 43       | IFS1<31>               | IEC1<31> | IPC10<28:26> | IPC10<25:24> | No                   |
| Lowest Natural Order Priority      |       |          |                        |          |              |              |                      |

**Note 1:** Not all interrupt sources are available on all devices. See [TABLE 1: “PIC32MX1XX 28/36/44-Pin General Purpose Family Features”](#) and [TABLE 2: “PIC32MX2XX 28/36/44-pin USB Family Features”](#) for the lists of available peripherals.

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** With the exception of those noted, all registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4 0x8 and 0xC, respectively. See [Section 11.2 "CLR, SET and INV Registers"](#) for more information.

**2:** These bits are not available on PIC32MX1XX devices.

**3:** This register does not have associated CLR, SET, INV registers.

**TABLE 7-2: INTERRUPT REGISTER MAP (CONTINUED)**

| Virtual Address (BF88_#) | Register Name <sup>(1)</sup> | Bit Range     | Bits  |       |       |       |             |       |             |      |      |      |      |      |      |      |      |      | All Resets |               |      |
|--------------------------|------------------------------|---------------|-------|-------|-------|-------|-------------|-------|-------------|------|------|------|------|------|------|------|------|------|------------|---------------|------|

## 8.0 OSCILLATOR CONFIGURATION

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 6. "Oscillator Configuration"** (DS60001112), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

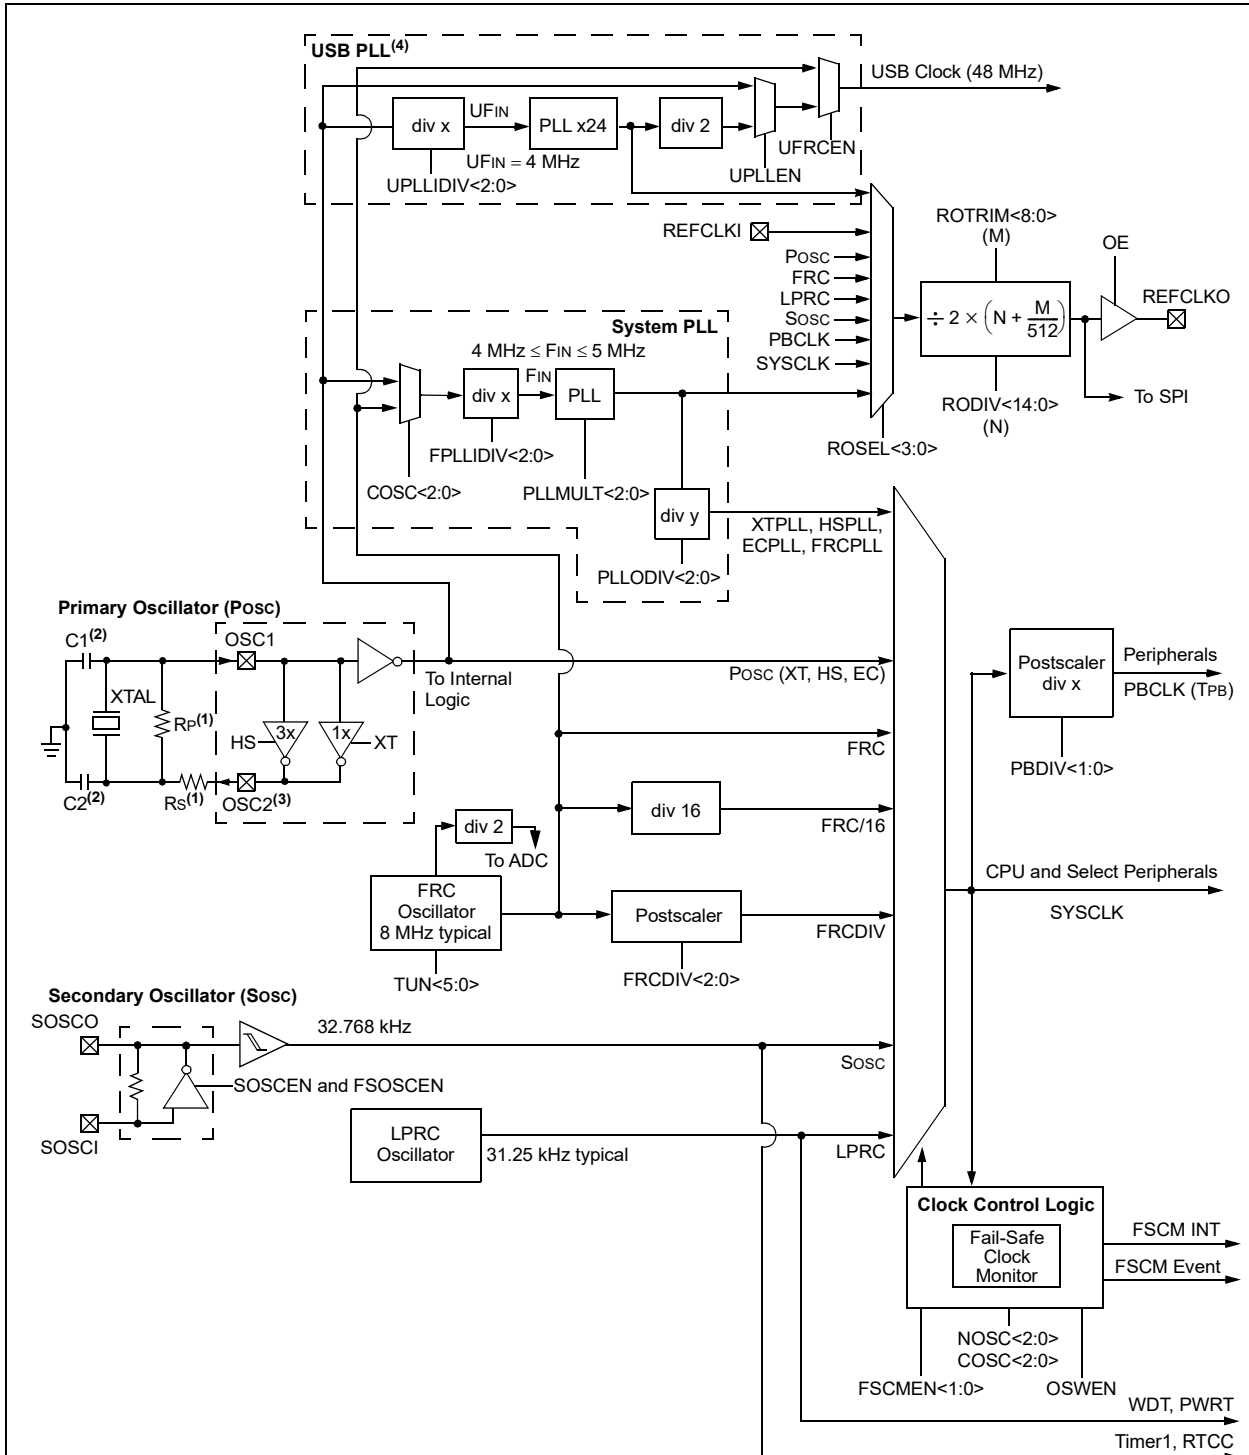

The PIC32MX1XX/2XX 28/36/44-pin Family oscillator system has the following modules and features:

- Four external and internal oscillator options as clock sources
- On-Chip PLL with user-selectable input divider, multiplier and output divider to boost operating frequency on select internal and external oscillator sources
- On-Chip user-selectable divisor postscaler on select oscillator sources
- Software-controllable switching between various clock sources
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown
- Dedicated On-Chip PLL for USB peripheral

A block diagram of the oscillator system is provided in [Figure 8-1](#).

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

FIGURE 8-1: OSCILLATOR DIAGRAM

- Notes:**
1. A series resistor,  $R_s$ , may be required for AT strip cut crystals or eliminate clipping. Alternately, to increase oscillator circuit gain, add a parallel resistor,  $R_p$ , with a value of  $1\text{ M}\Omega$ .
  2. Refer to Section 6, "Oscillator Configuration" (DS60001112) in the "PIC32 Family Reference Manual" for help in determining the best oscillator components.
  3. The PBCLK out is only available on the OSC2 pin in certain clock modes.
  4. The USB PLL is only available on PIC32MX2XX devices.

## 8.1 Oscillator Control Registers

**TABLE 8-1: OSCILLATOR CONTROL REGISTER MAP**

| Virtual Address<br>(BF80_#) | Register<br>Name <sup>(1)</sup> | Bit Range | Bits  |       |       |       |       |       |         |        |      |      |      |      |      |      |      |      | All Resets |   |   |      |                     |
|-----------------------------|---------------------------------|-----------|-------|-------|-------|-------|-------|-------|---------|--------|------|------|------|------|------|------|------|------|------------|---|---|------|---------------------|
|                             |                                 |           | 31/15 | 30/14 | 29/13 | 28/12 | 27/11 | 26/10 | 25/9    | 24/8   | 23/7 | 22/6 | 21/5 | 20/4 | 19/3 | 18/2 | 17/1 | 16/0 |            |   |   |      |                     |
| F000                        | OSCCON                          | 31:16     | —     | —     | —     | —     | —     | —     | —       | —      | —    | —    | —    | —    | —    | —    | —    | —    | —          | — | — | —    | x1xx <sup>(2)</sup> |
|                             |                                 | 15:0      | —     | —     | —     | —     | —     | —     | —       | —      | —    | —    | —    | —    | —    | —    | —    | —    | —          | — | — | —    | xxxx <sup>(2)</sup> |

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 11.2 "CLR, SET and INV Registers" for more information.

**2:** Reset values are dependent on the DEVCFGx Configuration bits and the type of reset.

**3:** This bit is only available on PIC32MX2XX devices.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**Legend:** y = Value set from Configuration bits on POR  
R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
-n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

bit 29-27 **PLLODIV<2:0>:** Output Divider for PLL

- 111 = PLL output divided by 256
- 110 = PLL output divided by 64
- 101 = PLL output divided by 32
- 100 = PLL output divided by 16
- 011 = PLL output divided by 8
- 010 = PLL output divided by 4
- 001 = PLL output divided by 2
- 000 = PLL output divided by 1

bit 26-24 **FRCDIV<2:0>:** Internal Fast RC (FRC) Oscillator Clock Divider bits

- 111 = FRC divided by 256
- 110 = FRC divided by 64
- 101 = FRC divided by 32
- 100 = FRC divided by 16
- 011 = FRC divided by 8
- 010 = FRC divided by 4
- 001 = FRC divided by 2 (default setting)
- 000 = FRC divided by 1

bit 23 **Unimplemented:** Read as '0'

bit 22 **SOSCRDY:** Secondary Oscillator (Sosc) Ready Indicator bit

- 1 = The Secondary Oscillator is running and is stable
- 0 = The Secondary Oscillator is still warming up or is turned off

bit 21 **PBDIVRDY:** Peripheral Bus Clock (PBCLK) Divisor Ready bit

- 1 = PBDIV<1:0> bits can be written
- 0 = PBDIV<1:0> bits cannot be written

bit 20-19 **PBDIV<1:0>:** Peripheral Bus Clock (PBCLK) Divisor bits

- 11 = PBCLK is SYSCLK divided by 8 (default)
- 10 = PBCLK is SYSCLK divided by 4
- 01 = PBCLK is SYSCLK divided by 2
- 00 = PBCLK is SYSCLK divided by 1

**Note 1:** This bit is only available on PIC32MX2XX devices.

**Note:** Writes to this register require an unlock sequence. Refer to **Section 6. "Oscillator"** (DS60001112) in the "PIC32 Family Reference Manual" for details.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER

- bit 18-16 **PLLMULT<2:0>**: Phase-Locked Loop (PLL) Multiplier bits
- 111 = Clock is multiplied by 24
  - 110 = Clock is multiplied by 21
  - 101 = Clock is multiplied by 20
  - 100 = Clock is multiplied by 19
  - 011 = Clock is multiplied by 18
  - 010 = Clock is multiplied by 17
  - 001 = Clock is multiplied by 16
  - 000 = Clock is multiplied by 15
- bit 15 **Unimplemented**: Read as '0'
- bit 14-12 **COSC<2:0>**: Current Oscillator Selection bits
- 111 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (OSCCON<26:24>)
  - 110 = Internal Fast RC (FRC) Oscillator divided by 16
  - 101 = Internal Low-Power RC (LPRC) Oscillator
  - 100 = Secondary Oscillator (Sosc)
  - 011 = Primary Oscillator (Posc) with PLL module (XTPLL, HSPLL or ECPLL)
  - 010 = Primary Oscillator (Posc) (XT, HS or EC)
  - 001 = Internal Fast RC Oscillator with PLL module via Postscaler (FRCPLL)
  - 000 = Internal Fast RC (FRC) Oscillator
- bit 11 **Unimplemented**: Read as '0'
- bit 10-8 **NOOSC<2:0>**: New Oscillator Selection bits
- 111 = Internal Fast RC Oscillator (FRC) divided by OSCCON<FRCDIV> bits
  - 110 = Internal Fast RC Oscillator (FRC) divided by 16
  - 101 = Internal Low-Power RC (LPRC) Oscillator
  - 100 = Secondary Oscillator (Sosc)
  - 011 = Primary Oscillator with PLL module (XTPLL, HSPLL or ECPLL)
  - 010 = Primary Oscillator (XT, HS or EC)
  - 001 = Internal Fast Internal RC Oscillator with PLL module via Postscaler (FRCPLL)
  - 000 = Internal Fast Internal RC Oscillator (FRC)
- On Reset, these bits are set to the value of the FNOOSC Configuration bits (DEVCFG1<2:0>).
- bit 7 **CLKLOCK**: Clock Selection Lock Enable bit
- If clock switching and monitoring is disabled (FCKSM<1:0> = 1x):
- 1 = Clock and PLL selections are locked
  - 0 = Clock and PLL selections are not locked and may be modified
- If clock switching and monitoring is enabled (FCKSM<1:0> = 0x):  
Clock and PLL selections are never locked and may be modified.
- bit 6 **ULOCK**: USB PLL Lock Status bit<sup>(1)</sup>
- 1 = The USB PLL module is in lock or USB PLL module start-up timer is satisfied
  - 0 = The USB PLL module is out of lock or USB PLL module start-up timer is in progress or the USB PLL is disabled
- bit 5 **SLOCK**: PLL Lock Status bit
- 1 = The PLL module is in lock or PLL module start-up timer is satisfied
  - 0 = The PLL module is out of lock, the PLL start-up timer is running, or the PLL is disabled
- bit 4 **SLPEN**: Sleep Mode Enable bit
- 1 = The device will enter Sleep mode when a WAIT instruction is executed
  - 0 = The device will enter Idle mode when a WAIT instruction is executed

**Note 1:** This bit is only available on PIC32MX2XX devices.

**Note:** Writes to this register require an unlock sequence. Refer to **Section 6. "Oscillator"** (DS60001112) in the *"PIC32 Family Reference Manual"* for details.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER

- bit 3     **CF:** Clock Fail Detect bit  
          1 = FSCM has detected a clock failure  
          0 = No clock failure has been detected
- bit 2     **UFRGEN:** USB FRC Clock Enable bit<sup>(1)</sup>  
          1 = Enable the FRC as the clock source for the USB clock source  
          0 = Use the Primary Oscillator or USB PLL as the USB clock source
- bit 1     **SOSCEN:** Secondary Oscillator (SOSC) Enable bit  
          1 = Enable the Secondary Oscillator  
          0 = Disable the Secondary Oscillator
- bit 0     **OSWEN:** Oscillator Switch Enable bit  
          1 = Initiate an oscillator switch to selection specified by NOSC<2:0> bits  
          0 = Oscillator switch is complete

**Note 1:** This bit is only available on PIC32MX2XX devices.

**Note:** Writes to this register require an unlock sequence. Refer to **Section 6. "Oscillator"** (DS60001112) in the *"PIC32 Family Reference Manual"* for details.

| -n = Value at POR | '1' = Bit is set        | '0' = Bit is cleared      x = Bit is unknown |

- bit 31 **Unimplemented:** Read as '0'
- bit 30-16 **RODIV<14:0>** Reference Clock Divider bits<sup>(1,3)</sup>  
The value selects the reference clock divider bits. See [Figure 8-1](#) for information.
- bit 15 **ON:** Output Enable bit  
1 = Reference Oscillator module is enabled  
0 = Reference Oscillator module is disabled
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **SIDL:** Peripheral Stop in Idle Mode bit  
1 = Discontinue module operation when the device enters Idle mode  
0 = Continue module operation when the device enters Idle mode
- bit 12 **OE:** Reference Clock Output Enable bit  
1 = Reference clock is driven out on REFCLKO pin  
0 = Reference clock is not driven out on REFCLKO pin
- bit 11 **RSLP:** Reference Oscillator Module Run in Sleep bit<sup>(2)</sup>  
1 = Reference Oscillator module output continues to run in Sleep  
0 = Reference Oscillator module output is disabled in Sleep
- bit 10 **Unimplemented:** Read as '0'
- bit 9 **DIVSWEN:** Divider Switch Enable bit  
1 = Divider switch is in progress  
0 = Divider switch is complete
- bit 8 **ACTIVE:** Reference Clock Request Status bit  
1 = Reference clock request is active  
0 = Reference clock request is not active
- bit 7-4 **Unimplemented:** Read as '0'

- Note 1:** The ROSEL and RODIV bits should not be written while the ACTIVE bit is '1', as undefined behavior may result.
- 2:** This bit is ignored when the ROSEL<3:0> bits = 0000 or 0001.
- 3:** While the ON bit is set to '1', writes to these bits do not take effect until the DIVSWEN bit is also set to '1'.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 9.0 DIRECT MEMORY ACCESS (DMA) CONTROLLER

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 31. “Direct Memory Access (DMA) Controller”** (DS60001117), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The PIC32 Direct Memory Access (DMA) controller is a bus master module useful for data transfers between different devices without CPU intervention. The source and destination of a DMA transfer can be any of the memory mapped modules existent in the PIC32, such as Peripheral Bus devices: SPI, UART, PMP, etc., or memory itself. [Figure 9-1](#) show a block diagram of the DMA Controller module.

The DMA Controller module has the following key features:

- Four identical channels, each featuring:
  - Auto-increment source and destination address registers
  - Source and destination pointers
  - Memory to memory and memory to peripheral transfers
- Automatic word-size detection:
  - Transfer granularity, down to byte level
  - Bytes need not be word-aligned at source and destination

- Fixed priority channel arbitration
- Flexible DMA channel operating modes:
  - Manual (software) or automatic (interrupt) DMA requests
  - One-Shot or Auto-Repeat Block Transfer modes
  - Channel-to-channel chaining
- Flexible DMA requests:
  - A DMA request can be selected from any of the peripheral interrupt sources
  - Each channel can select any (appropriate) observable interrupt as its DMA request source
  - A DMA transfer abort can be selected from any of the peripheral interrupt sources
  - Pattern (data) match transfer termination
- Multiple DMA channel status interrupts:
  - DMA channel block transfer complete
  - Source empty or half empty
  - Destination full or half full
  - DMA transfer aborted due to an external event
  - Invalid DMA address generated
- DMA debug support features:
  - Most recent address accessed by a DMA channel
  - Most recent DMA channel to transfer data
- CRC Generation module:
  - CRC module can be assigned to any of the available channels
  - CRC module is highly configurable

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 11.2 "CLR, SET and INV Registers" for more information.

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 11.2 "CLR, SET and INV Registers" for more information.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

bit 29-28 **BYTO<1:0>:** CRC Byte Order Selection bits

- 11 = Endian byte swap on half-word boundaries (i.e., source half-word order with reverse source byte order per half-word)
- 10 = Swap half-words on word boundaries (i.e., reverse source half-word order with source byte order per half-word)
- 01 = Endian byte swap on word boundaries (i.e., reverse source byte order)
- 00 = No swapping (i.e., source byte order)

bit 27 **WBO:** CRC Write Byte Order Selection bit<sup>(1)</sup>

- 1 = Source data is written to the destination re-ordered as defined by BYTO<1:0>
- 0 = Source data is written to the destination unaltered

bit 26-25 **Unimplemented:** Read as '0'

bit 24 **BITO:** CRC Bit Order Selection bit

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

- 1 = The IP header checksum is calculated Least Significant bit (LSb) first (i.e., reflected)
- 0 = The IP header checksum is calculated Most Significant bit (MSb) first (i.e., not reflected)

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

- 1 = The LFSR CRC is calculated Least Significant bit first (i.e., reflected)
- 0 = The LFSR CRC is calculated Most Significant bit first (i.e., not reflected)

bit 23-13 **Unimplemented:** Read as '0'

bit 12-8 **PLEN<4:0>:** Polynomial Length bits

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

These bits are unused.

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

Denotes the length of the polynomial – 1.

bit 7 **CRCCEN:** CRC Enable bit

- 1 = CRC module is enabled and channel transfers are routed through the CRC module
- 0 = CRC module is disabled and channel transfers proceed normally

**Note 1:** When WBO = 1, unaligned transfers are not supported and the CRCCAPP bit cannot be set.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 9-4: DCRCCON: DMA CRC CONTROL REGISTER (CONTINUED)

- bit 6     **CRCAPP:** CRC Append Mode bit<sup>(1)</sup>  
1 = The DMA transfers data from the source into the CRC but NOT to the destination. When a block transfer completes the DMA writes the calculated CRC value to the location given by CHxDSA  
0 = The DMA transfers data from the source through the CRC obeying WBO as it writes the data to the destination
- bit 5     **CRCTYP:** CRC Type Selection bit  
1 = The CRC module will calculate an IP header checksum  
0 = The CRC module will calculate a LFSR CRC
- bit 4-3   **Unimplemented:** Read as '0'
- bit 2-0   **CRCCH<2:0>:** CRC Channel Select bits  
111 = CRC is assigned to Channel 7  
110 = CRC is assigned to Channel 6  
101 = CRC is assigned to Channel 5  
100 = CRC is assigned to Channel 4  
011 = CRC is assigned to Channel 3  
010 = CRC is assigned to Channel 2  
001 = CRC is assigned to Channel 1  
000 = CRC is assigned to Channel 0

**Note 1:** When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

bit 31-0 **DCRCDATA<31:0>**: CRC Data Register bits

Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

Bits greater than PLEN will return '0' on any read.

bit 31-24 **Unimplemented:** Read as '0'

bit 23-16 **CHAIRQ<7:0>**: Channel Transfer Abort IRQ bits<sup>(1)</sup>

11111111 = Interrupt 255 will abort any transfers in progress and set CHAIF flag

•  
•  
•

00000001 = Interrupt 1 will abort any transfers in progress and set CHAIF flag

00000000 = Interrupt 0 will abort any transfers in progress and set CHAIF flag

bit 15-8 **CHSIRQ<7:0>**: Channel Transfer Start IRQ bits<sup>(1)</sup>

11111111 = Interrupt 255 will initiate a DMA transfer

•  
•  
•

00000001 = Interrupt 1 will initiate a DMA transfer

00000000 = Interrupt 0 will initiate a DMA transfer

bit 7 **CFORCE**: DMA Forced Transfer bit

1 = A DMA transfer is forced to begin when this bit is written to a '1'

0 = This bit always reads '0'

bit 6 **CABORT**: DMA Abort Transfer bit

1 = A DMA transfer is aborted when this bit is written to a '1'

0 = This bit always reads '0'

bit 5 **PATEN**: Channel Pattern Match Abort Enable bit

1 = Abort transfer and clear CHEN on pattern match

0 = Pattern match is disabled

bit 4 **SIRQEN**: Channel Start IRQ Enable bit

1 = Start channel cell transfer if an interrupt matching CHSIRQ occurs

0 = Interrupt number CHSIRQ is ignored and does not start a transfer

bit 3 **AIRQEN**: Channel Abort IRQ Enable bit

1 = Channel transfer is aborted if an interrupt matching CHAIRQ occurs

0 = Interrupt number CHAIRQ is ignored and does not terminate a transfer

bit 2-0 **Unimplemented:** Read as '0'

**Note 1:** See [Table 7-1: "Interrupt IRQ, Vector and Bit Location"](#) for the list of available interrupt IRQ sources.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7-0 **CHPDAT<7:0>:** Channel Data Register bits

Pattern Terminate mode:

Data to be matched must be stored in this register to allow a "terminate on match".

All other modes:

Unused.

## 10.0 USB ON-THE-GO (OTG)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 27. “USB On-The-Go (OTG)”** (DS60001126), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 Full-Speed and Low-Speed embedded host, Full-Speed device or OTG implementation with a minimum of external components. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the clock generator, the USB voltage comparators, the transceiver, the Serial Interface Engine (SIE), a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32 USB OTG module is presented in [Figure 10-1](#).

The clock generator provides the 48 MHz clock required for USB Full-Speed and Low-Speed communication. The voltage comparators monitor the voltage on the VBUS pin to determine the state of the bus. The transceiver provides the analog translation between the USB bus and the digital logic. The SIE is a state machine that transfers data to and from the endpoint buffers and generates the hardware protocol for data transfers. The USB DMA controller transfers data between the data buffers in RAM and the SIE. The integrated pull-up and pull-down resistors eliminate the need for external signaling components. The register interface allows the CPU to configure and communicate with the module.

The PIC32 USB module includes the following features:

- USB Full-Speed support for Host and Device
- Low-Speed Host support
- USB OTG support
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Endpoint buffering anywhere in system RAM
- Integrated DMA to access system RAM and Flash

**Note:** The implementation and use of the USB specifications, as well as other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc., also referred to as USB-IF ([www.usb.org](http://www.usb.org)). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** With the exception of those noted, all registers in this table (except as noted) have corresponding CLR, SET and INV registers at their virtual address, plus an offset of 0x4, 0x8, and 0xC respectively. See Section 11.2 "CLR, SET and INV Registers" for more information.

**2:** This register does not have associated SET and INV registers.

**3:** This register does not have associated CLR, SET and INV registers.

**4:** Reset value for this bit is undefined.

**Legend:**

|                   |                  |                                    |
|-------------------|------------------|------------------------------------|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared               |
|                   |                  | x = Bit is unknown                 |

bit 31-8 **Unimplemented:** Read as '0'

bit 7 **UACTPND:** USB Activity Pending bit

- 1 = USB bus activity has been detected; however, an interrupt is pending, which has yet to be generated
- 0 = An interrupt is not pending

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **USLPGRD:** USB Sleep Entry Guard bit

- 1 = Sleep entry is blocked if USB bus activity is detected or if a notification is pending
- 0 = USB module does not block Sleep entry

bit 3 **USBBUSY:** USB Module Busy bit<sup>(1)</sup>

- 1 = USB module is active or disabled, but not ready to be enabled
- 0 = USB module is not active and is ready to be enabled

bit 2 **Unimplemented:** Read as '0'

bit 1 **USUSPEND:** USB Suspend Mode bit

- 1 = USB module is placed in Suspend mode  
(The 48 MHz USB clock will be gated off. The transceiver is placed in a low-power state.)
- 0 = USB module operates normally

bit 0 **USBPWR:** USB Operation Enable bit

- 1 = USB module is turned on
- 0 = USB module is disabled  
(Outputs held inactive, device pins not used by USB, analog features are shut down to reduce power consumption.)

**Note 1:** When USBPWR = 0 and USBBUSY = 1, status from all other registers is invalid and writes to all USB module registers produce undefined results.

|                   |                         |  |
|-------------------|-------------------------|--|
| <b>Legend:</b>    | WC = Write '1' to clear | HS = Hardware Settable bit                   |
| R = Readable bit  | W = Writable bit        | U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set        | '0' = Bit is cleared      x = Bit is unknown |

bit 31-8 **Unimplemented:** Read as '0'

bit 7 **STALLIF:** STALL Handshake Interrupt bit

1 = In Host mode a STALL handshake was received during the handshake phase of the transaction  
In Device mode a STALL handshake was transmitted during the handshake phase of the transaction  
0 = STALL handshake has not been sent

bit 6 **ATTACHIF:** Peripheral Attach Interrupt bit<sup>(1)</sup>

1 = Peripheral attachment was detected by the USB module  
0 = Peripheral attachment was not detected

bit 5 **RESUMEIF:** Resume Interrupt bit<sup>(2)</sup>

1 = K-State is observed on the D+ or D- pin for 2.5  $\mu$ s  
0 = K-State is not observed

bit 4 **IDLEIF:** Idle Detect Interrupt bit

1 = Idle condition detected (constant Idle state of 3 ms or more)  
0 = No Idle condition detected

bit 3 **TRNIF:** Token Processing Complete Interrupt bit<sup>(3)</sup>

1 = Processing of current token is complete; a read of the U1STAT register will provide endpoint information  
0 = Processing of current token not complete

bit 2 **SOFIF:** SOF Token Interrupt bit

1 = SOF token received by the peripheral or the SOF threshold reached by the host  
0 = SOF token was not received nor threshold reached

bit 1 **UERRIF:** USB Error Condition Interrupt bit<sup>(4)</sup>

1 = Unmasked error condition has occurred  
0 = Unmasked error condition has not occurred

bit 0 **URSTIF:** USB Reset Interrupt bit (Device mode)<sup>(5)</sup>

1 = Valid USB Reset has occurred  
0 = No USB Reset has occurred

**DETACHIF:** USB Detach Interrupt bit (Host mode)<sup>(6)</sup>

1 = Peripheral detachment was detected by the USB module  
0 = Peripheral detachment was not detected

**Note 1:** This bit is valid only if the HOSTEN bit is set (see [Register 10-11](#)), there is no activity on the USB for 2.5  $\mu$ s, and the current bus state is not SE0.

**2:** When not in Suspend mode, this interrupt should be disabled.

**3:** Clearing this bit will cause the STAT FIFO to advance.

**4:** Only error conditions enabled through the U1EIE register will set this bit.

**5:** Device mode.

**6:** Host mode.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7-4 **ENDPT<3:0>:** Encoded Number of Last Endpoint Activity bits  
 (Represents the number of the Buffer Descriptor Table, updated by the last USB transfer.)

- 1111 = Endpoint 15
- 1110 = Endpoint 14
- .
- .
- .
- 0001 = Endpoint 1
- 0000 = Endpoint 0

bit 3 **DIR:** Last Buffer Descriptor Direction Indicator bit  
 1 = Last transaction was a transmit (TX) transfer  
 0 = Last transaction was a receive (RX) transfer

bit 2 **PPBI:** Ping-Pong Buffer Descriptor Pointer Indicator bit  
 1 = The last transaction was to the ODD Buffer Descriptor bank  
 0 = The last transaction was to the EVEN Buffer Descriptor bank

bit 1-0 **Unimplemented:** Read as '0'

**Note:** The U1STAT register is a window into a 4-byte FIFO maintained by the USB module. U1STAT value is only valid when the TRNIF (U1IR<3>) bit is active. Clearing the TRNIF bit advances the FIFO. Data in register is invalid when the TRNIF bit = 0.

### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7 **JSTATE:** Live Differential Receiver JSTATE flag bit

1 = JSTATE was detected on the USB

0 = No JSTATE was detected

bit 6 **SE0:** Live Single-Ended Zero flag bit

1 = Single-Ended Zero was detected on the USB

0 = No Single-Ended Zero was detected

bit 5 **PKTDIS:** Packet Transfer Disable bit<sup>(4)</sup>

1 = Token and packet processing is disabled (set upon SETUP token received)

0 = Token and packet processing is enabled

**TOKBUSY:** Token Busy Indicator bit<sup>(1,5)</sup>

1 = Token is being executed by the USB module

0 = No token is being executed

bit 4 **USBRST:** Module Reset bit<sup>(5)</sup>

1 = USB reset generated

0 = USB reset terminated

bit 3 **HOSTEN:** Host Mode Enable bit<sup>(2)</sup>

1 = USB host capability is enabled

0 = USB host capability is disabled

bit 2 **RESUME:** RESUME Signaling Enable bit<sup>(3)</sup>

1 = RESUME signaling is activated

0 = RESUME signaling is disabled

**Note 1:** Software is required to check this bit before issuing another token command to the U1TOK register (see [Register 10-15](#)).

**2:** All host control logic is reset any time that the value of this bit is toggled.

**3:** Software must set RESUME for 10 ms if the part is a function, or for 25 ms if the part is a host, and then clear it to enable remote wake-up. In Host mode, the USB module will append a Low-Speed EOP to the RESUME signaling when this bit is cleared.

**4:** Device mode.

**5:** Host mode.

## REGISTER 10-11: U1CON: USB CONTROL REGISTER (CONTINUED)

- bit 1    **PPBRST:** Ping-Pong Buffers Reset bit  
         1 = Reset all Even/Odd buffer pointers to the EVEN Buffer Descriptor banks  
         0 = Even/Odd buffer pointers are not Reset
- bit 0    **USBEN:** USB Module Enable bit<sup>(4)</sup>  
         1 = USB module and supporting circuitry is enabled  
         0 = USB module and supporting circuitry is disabled
- SOFEN:** SOF Enable bit<sup>(5)</sup>  
         1 = SOF token is sent every 1 ms  
         0 = SOF token is disabled

- Note 1:** Software is required to check this bit before issuing another token command to the U1TOK register (see [Register 10-15](#)).
- 2:** All host control logic is reset any time that the value of this bit is toggled.
- 3:** Software must set RESUME for 10 ms if the part is a function, or for 25 ms if the part is a host, and then clear it to enable remote wake-up. In Host mode, the USB module will append a Low-Speed EOP to the RESUME signaling when this bit is cleared.
- 4:** Device mode.
- 5:** Host mode.

 0 = Endpoint n transmit is disabled

bit 1 **EPSTALL:** Endpoint Stall Status bit  
 1 = Endpoint n was stalled  
 0 = Endpoint n was not stalled

bit 0 **EPHSBK:** Endpoint Handshake Enable bit  
 1 = Endpoint Handshake is enabled  
 0 = Endpoint Handshake is disabled (typically used for isochronous endpoints)

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 11.0 I/O PORTS

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "I/O Ports"** (DS60001120), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

General purpose I/O pins are the simplest of peripherals. They allow the PIC® MCU to monitor and control other devices. To add flexibility and functionality, some pins are multiplexed with alternate functions.

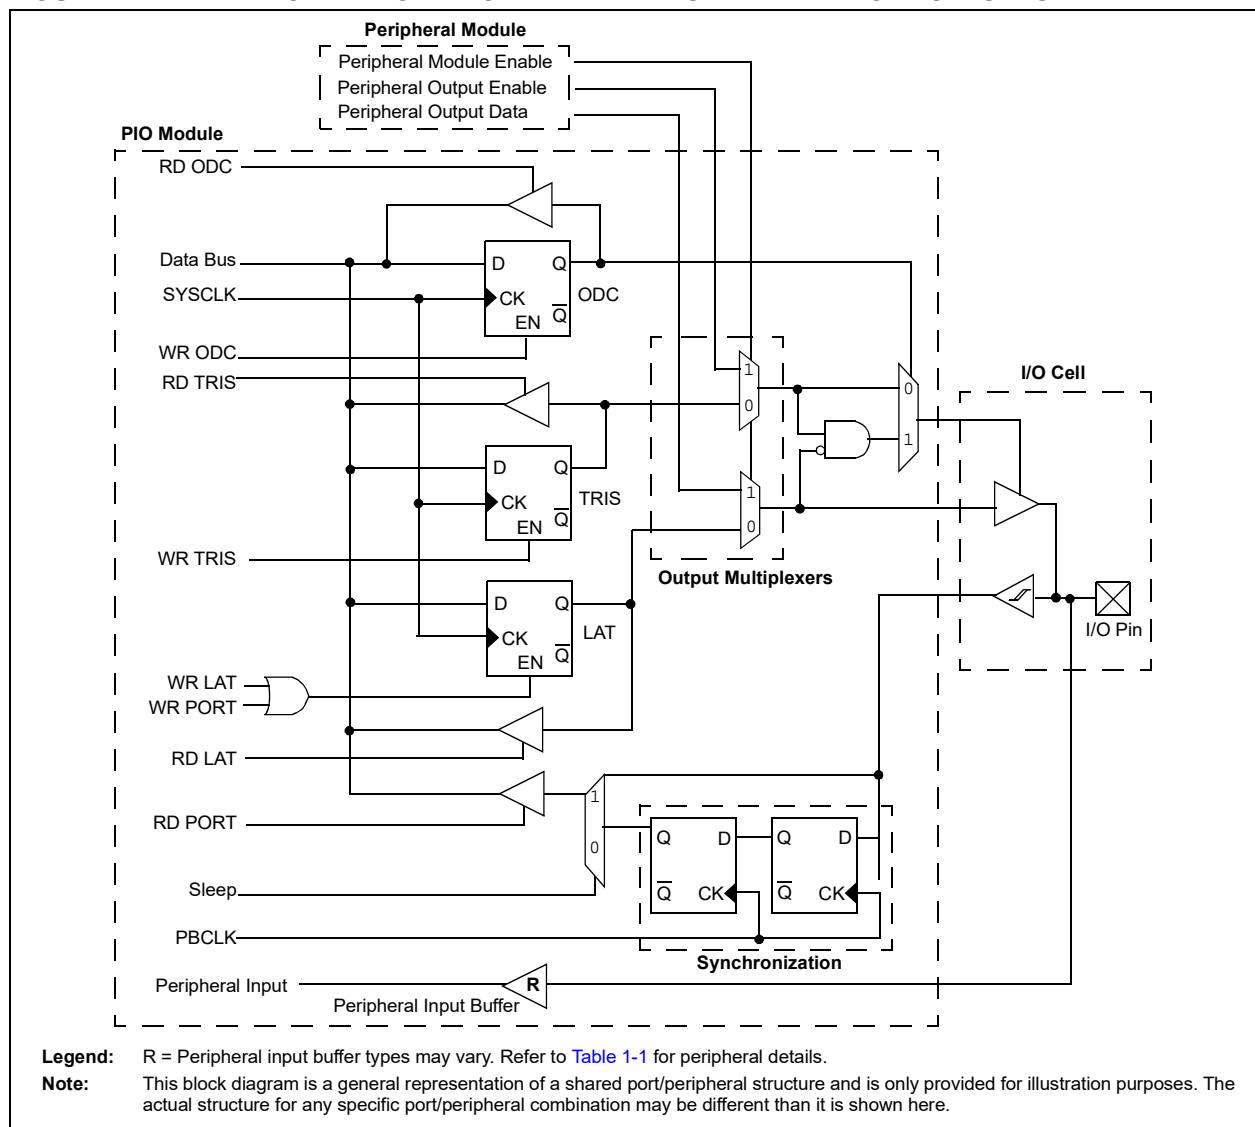

These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

Key features of this module include:

- Individual output pin open-drain enable/disable
- Individual input pin weak pull-up and pull-down
- Monitor selective inputs and generate interrupt when change in pin state is detected
- Operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET, and INV registers

Figure 11-1 illustrates a block diagram of a typical multiplexed I/O port.

**FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL MULTIPLEXED PORT STRUCTURE**

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 11.1 Parallel I/O (PIO) Ports

All port pins have 10 registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

### 11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx, and TRISx registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V-tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum V<sub>IH</sub> specification.

See the “[Pin Diagrams](#)” section for the available pins and their functionality.

### 11.1.2 CONFIGURING ANALOG AND DIGITAL PORT PINS

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSEL and TRIS bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

If the TRIS bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

### 11.1.3 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be a NOP.

### 11.1.4 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports allows the PIC32MX1XX/2XX 28/36/44-pin Family devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a change-of-state.

Five control registers are associated with the CN functionality of each I/O port. The CNENx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

The CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

**Note:** Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

An additional control register (CNCONx) is shown in [Register 11-3](#).

## 11.2 CLR, SET and INV Registers

Every I/O module register has a corresponding CLR (clear), SET (set) and INV (invert) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR, or INV register, the base register must be read.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 11.3 Peripheral Pin Select

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

The Peripheral Pin Select (PPS) configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

### 11.3.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation “RPn” in their full pin designation, where “RP” designates a remappable peripheral and “n” is the remappable port number.

### 11.3.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital-only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital-only peripheral modules are never included in the PPS feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I<sup>2</sup>C among others. A similar requirement excludes all modules with analog inputs, such as the Analog-to-Digital Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin.

Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

### 11.3.3 CONTROLLING PERIPHERAL PIN SELECT

PPS features are controlled through two sets of SFRs: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

### 11.3.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The [pin name]R registers, where [pin name] refers to the peripheral pins listed in Table 11-1, are used to configure peripheral input mapping (see Register 11-1). Each register contains sets of 4 bit fields. Programming these bit fields with an appropriate value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field is shown in Table 11-1.

For example, Figure 11-2 illustrates the remappable pin selection for the U1RX input.

**Note 1:** This pin is not available on 28-pin devices.

**2:** This pin is only available on 44-pin devices.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 11.3.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPnR registers (Register 11-2) are used to control output mapping. Like the [pin name]R registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 11-2 and Figure 11-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

**FIGURE 11-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPA0**

## 11.3.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC32 devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

### 11.3.6.1 Control Register Lock Sequence

Under normal operation, writes to the RPnR and [pin name]R registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the Configuration bit, IOLOCK (CFGCON<13>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to Section 6. "Oscillator" (DS60001112) in the "PIC32 Family Reference Manual" for details.

### 11.3.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPnR and [pin name]R registers. The Configuration bit, IOL1WAY (DEVCFG3<29>), blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 1:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 11.2 “CLR, SET and INV Registers” for more information.

**2:** This bit is only available on 44-pin devices.

**Legend:**

**Note 1:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

**Note 2:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 11.2 “CLR, SET and INV Registers” for more information.

This bit is not available on PIC32MX2XX devices. The reset value for the TRISB register when this bit is not available is 0x0000E00F.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 12.0 TIMER1

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. “Timers”** (DS60001105), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

This family of PIC32 devices features one synchronous/asynchronous 16-bit timer that can operate as a free-running interval timer for various timing applications and counting external events. This timer can also be used with the Low-Power Secondary Oscillator (Sosc) for Real-Time Clock (RTC) applications.

The following modes are supported:

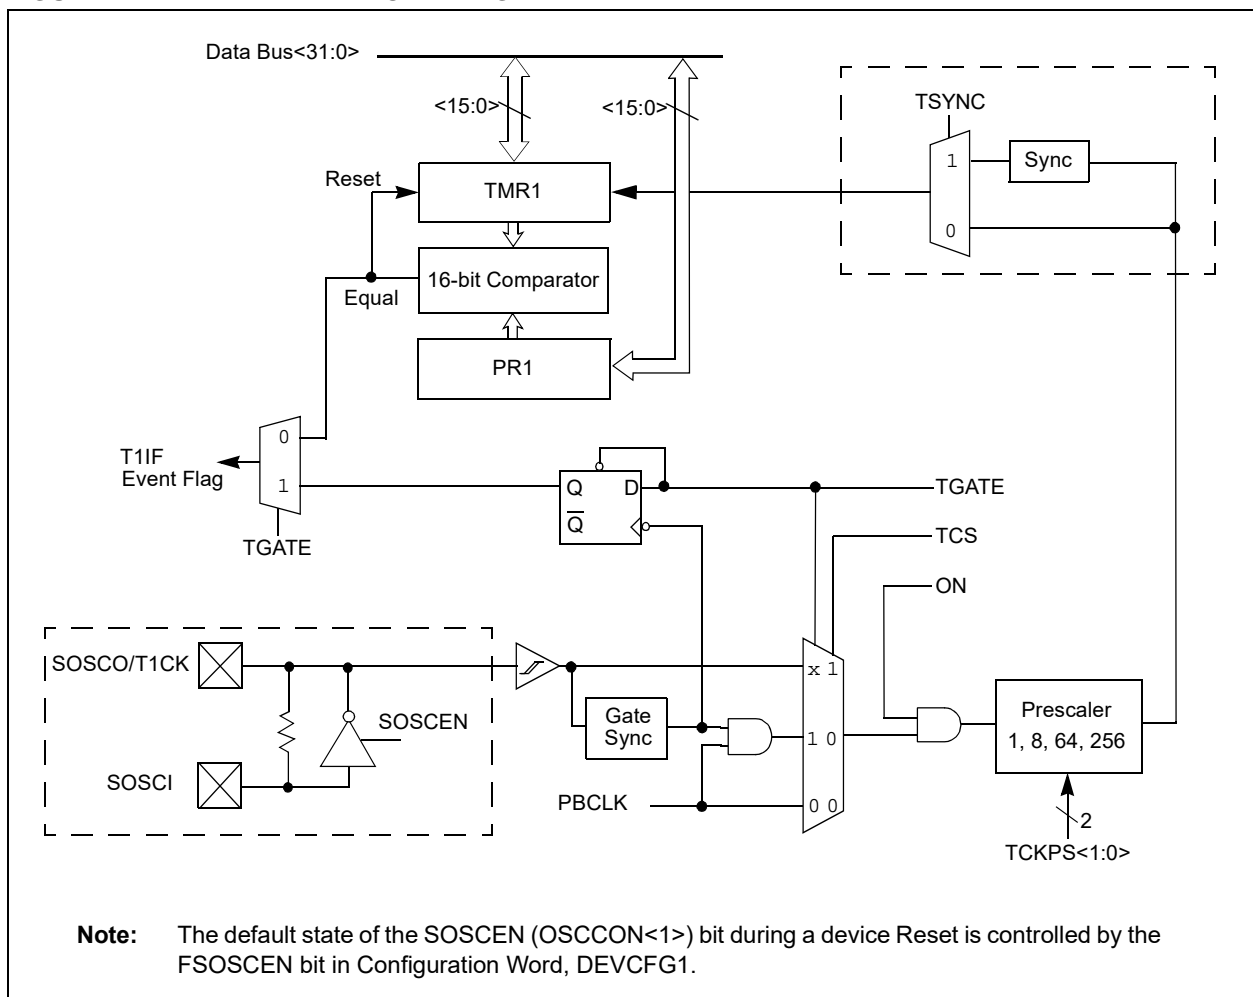

- Synchronous Internal Timer
- Synchronous Internal Gated Timer
- Synchronous External Timer
- Asynchronous External Timer

### 12.1 Additional Supported Features

- Selectable clock prescaler
- Timer operation during CPU Idle and Sleep mode
- Fast bit manipulation using CLR, SET and INV registers
- Asynchronous mode can be used with the Sosc to function as a Real-Time Clock (RTC)

Figure 12-1 illustrates a general block diagram of Timer1.

**FIGURE 12-1: TIMER1 BLOCK DIAGRAM**

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Timer On bit<sup>(1)</sup>

1 = Timer is enabled  
0 = Timer is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Discontinue module operation when the device enters Idle mode  
0 = Continue module operation when the device enters Idle mode

bit 12 **TWDIS:** Asynchronous Timer Write Disable bit

1 = Writes to Timer1 are ignored until pending write operation completes  
0 = Back-to-back writes are enabled (Legacy Asynchronous Timer functionality)

bit 11 **TWIP:** Asynchronous Timer Write in Progress bit

In Asynchronous Timer mode:

1 = Asynchronous write to the Timer1 register in progress  
0 = Asynchronous write to Timer1 register is complete

In Synchronous Timer mode:

This bit is read as '0'.

bit 10-8 **Unimplemented:** Read as '0'

bit 7 **TGATE:** Timer Gated Time Accumulation Enable bit

When TCS = 1:

This bit is ignored.

When TCS = 0:

1 = Gated time accumulation is enabled  
0 = Gated time accumulation is disabled

bit 6 **Unimplemented:** Read as '0'

bit 5-4 **TCKPS<1:0>:** Timer Input Clock Prescale Select bits

11 = 1:256 prescale value  
10 = 1:64 prescale value  
01 = 1:8 prescale value  
00 = 1:1 prescale value

**Note 1:** When using 1:1 PBCmLK divisor, the user's software should not read/write the peripheral SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 12-1: T1CON: TYPE A TIMER CONTROL REGISTER (CONTINUED)

- bit 3     **Unimplemented:** Read as '0'
- bit 2     **TSYNC:** Timer External Clock Input Synchronization Selection bit  
When TCS = 1:  
1 = External clock input is synchronized  
0 = External clock input is not synchronized  
When TCS = 0:  
This bit is ignored.
- bit 1     **TCS:** Timer Clock Source Select bit  
1 = External clock from TxCKI pin  
0 = Internal peripheral clock
- bit 0     **Unimplemented:** Read as '0'

**Note 1:** When using 1:1 PBCmLK divisor, the user's software should not read/write the peripheral SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 13.0 TIMER2/3, TIMER4/5

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

This family of PIC32 devices features four synchronous 16-bit timers (default) that can operate as a free-running interval timer for various timing applications and counting external events. The following modes are supported:

- Synchronous internal 16-bit timer
- Synchronous internal 16-bit gated timer
- Synchronous external 16-bit timer

Two 32-bit synchronous timers are available by combining Timer2 with Timer3 and Timer4 with Timer5. The 32-bit timers can operate in three modes:

- Synchronous internal 32-bit timer
- Synchronous internal 32-bit gated timer
- Synchronous external 32-bit timer

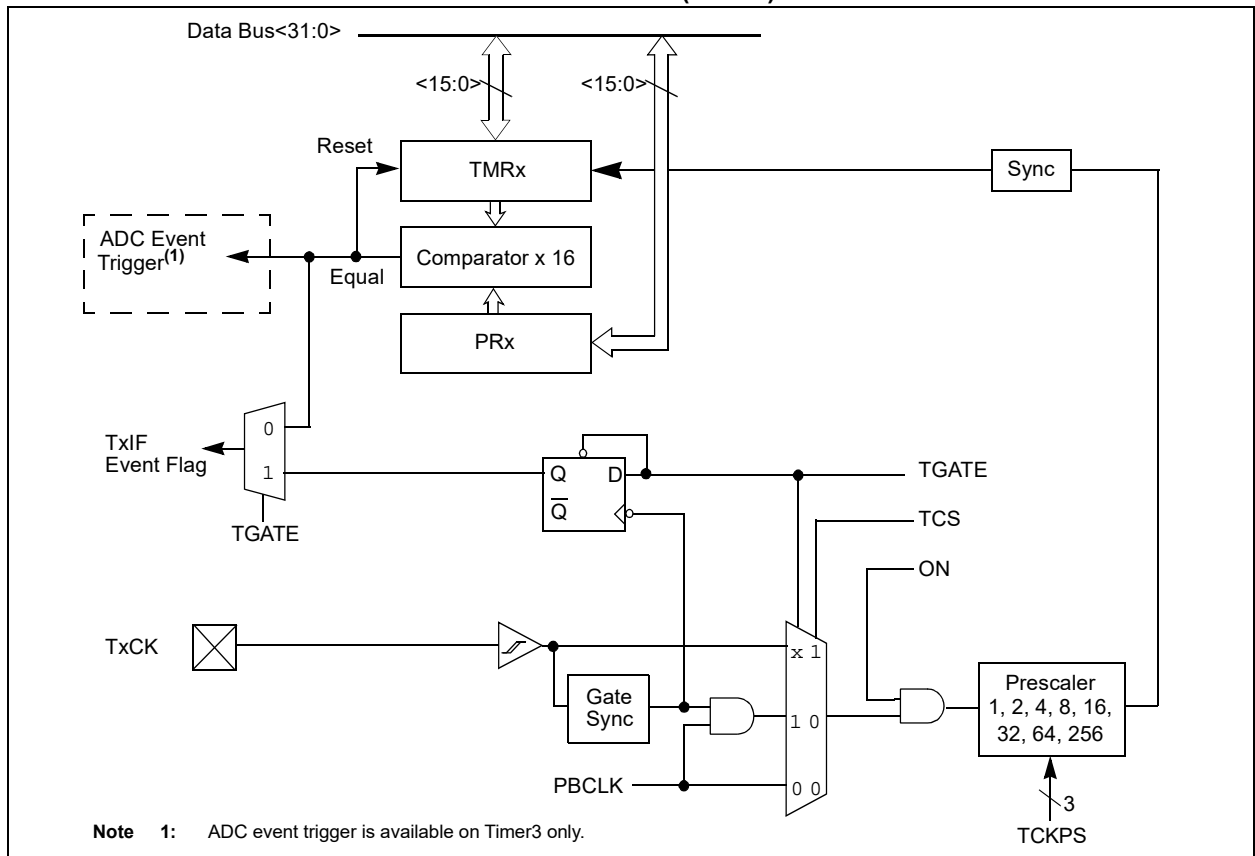

**Note:** In this chapter, references to registers, TxCON, TMRx and PRx, use 'x' to represent Timer2 through Timer5 in 16-bit modes. In 32-bit modes, 'x' represents Timer2 or Timer4 and 'y' represents Timer3 or Timer5.

## 13.1 Additional Supported Features

- Selectable clock prescaler
- Timers operational during CPU idle
- Time base for Input Capture and Output Compare modules (Timer2 and Timer3 only)
- ADC event trigger (Timer3 in 16-bit mode, Timer2/3 in 32-bit mode)
- Fast bit manipulation using CLR, SET and INV registers

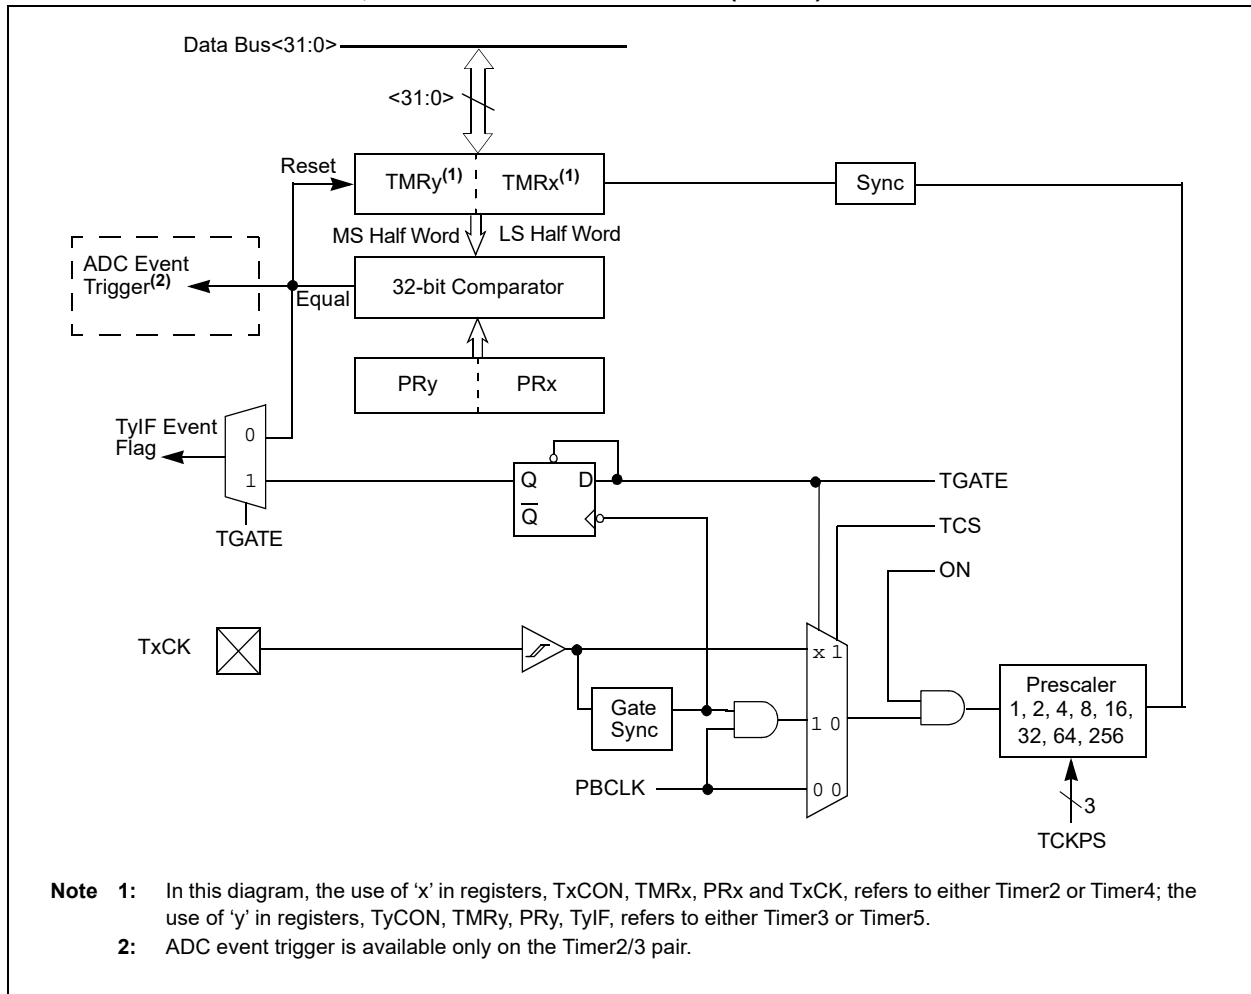

Figure 13-1 and Figure 13-2 illustrate block diagrams of Timer2/3 and Timer4/5.

x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Timer On bit<sup>(1,3)</sup>

1 = Module is enabled

0 = Module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit<sup>(4)</sup>

1 = Discontinue module operation when the device enters Idle mode

0 = Continue module operation when the device enters Idle mode

bit 12-8 **Unimplemented:** Read as '0'

bit 7 **TGATE:** Timer Gated Time Accumulation Enable bit<sup>(3)</sup>

When TCS = 1:

This bit is ignored and is read as '0'.

When TCS = 0:

1 = Gated time accumulation is enabled

0 = Gated time accumulation is disabled

bit 6-4 **TCKPS<2:0>:** Timer Input Clock Prescale Select bits<sup>(3)</sup>

111 = 1:256 prescale value

110 = 1:64 prescale value

101 = 1:32 prescale value

100 = 1:16 prescale value

011 = 1:8 prescale value

010 = 1:4 prescale value

001 = 1:2 prescale value

000 = 1:1 prescale value

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

**2:** This bit is available only on even numbered timers (Timer2 and Timer4).

**3:** While operating in 32-bit mode, this bit has no effect for odd numbered timers (Timer3, and Timer5). All timer functions are set through the even numbered timers.

**4:** While operating in 32-bit mode, this bit must be cleared on odd numbered timers to enable the 32-bit timer in Idle mode.

## 14.0 WATCHDOG TIMER (WDT)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. “Watchdog, Deadman, and Power-up Timers”** (DS60001114), which are available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

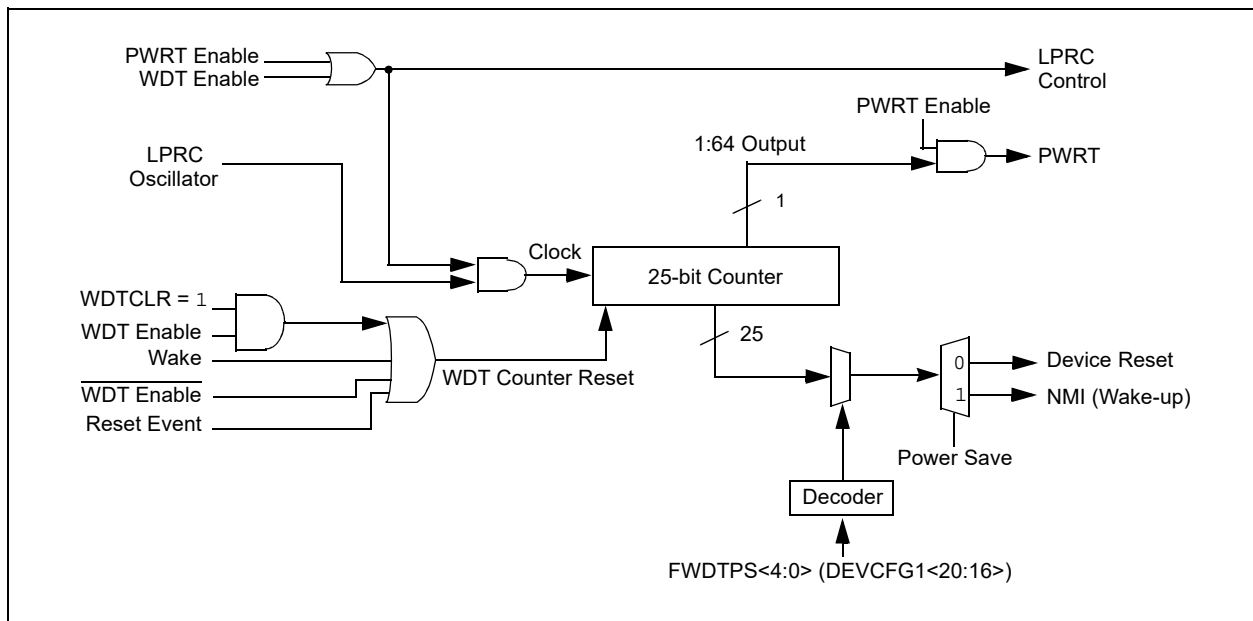

The WDT, when enabled, operates from the internal Low-Power Oscillator (LPRC) clock source and can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode.

The following are some of the key features of the WDT module:

- Configuration or software controlled
- User-configurable time-out period
- Can wake the device from Sleep or Idle mode

Figure 14-1 illustrates a block diagram of the WDT and Power-up timer.

**FIGURE 14-1: WATCHDOG TIMER AND POWER-UP TIMER BLOCK DIAGRAM**

## 15.0 INPUT CAPTURE

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. “Input Capture”** (DS60001122), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin. The following events cause capture events:

- Simple capture event modes:
  - Capture timer value on every rising and falling edge of input at ICx pin
  - Capture timer value on every edge (rising and falling)
  - Capture timer value on every edge (rising and falling), specified edge first.

- Prescaler capture event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

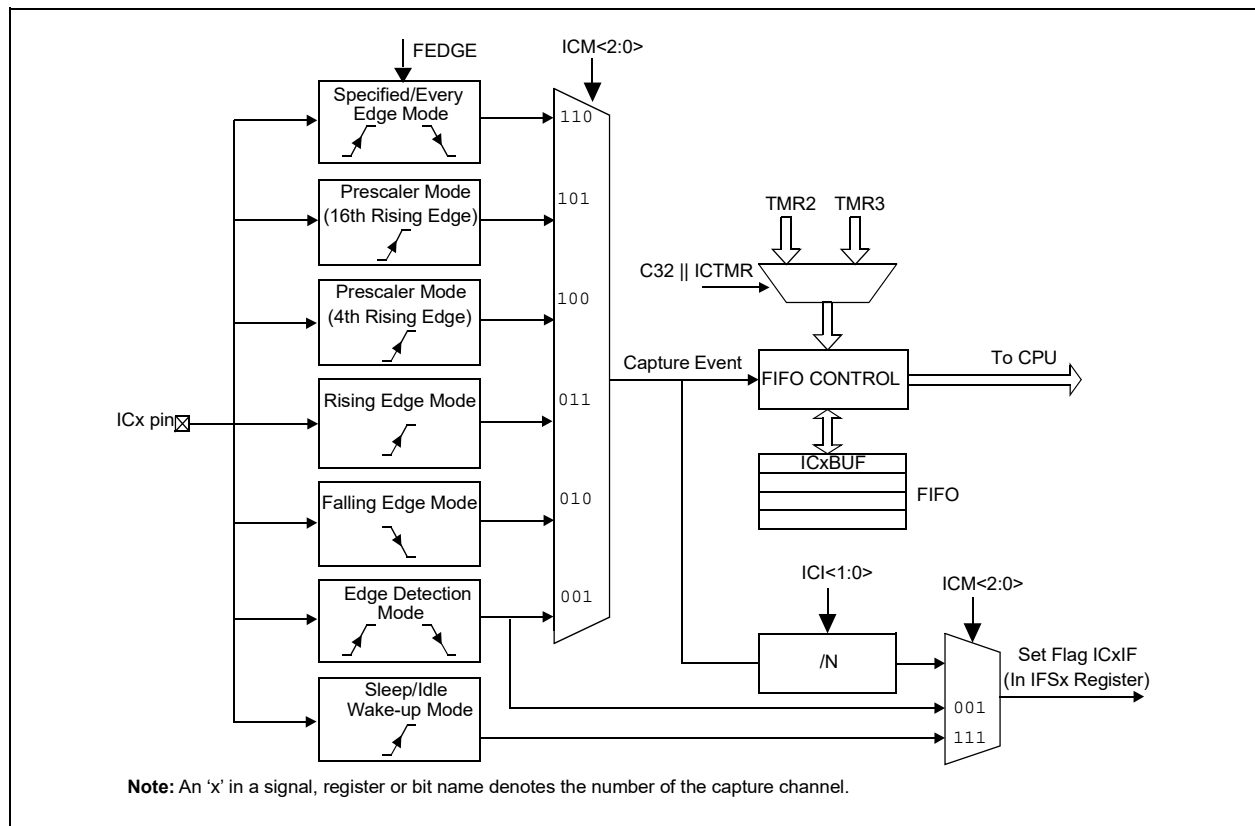

Each input capture channel can select between one of two 16-bit timers (Timer2 or Timer3) for the time base, or two 16-bit timers (Timer2 and Timer3) together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values (interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled)
- Input capture can also be used to provide additional sources of external interrupts

Figure 15-1 illustrates a general block diagram of the Input Capture module.

bit 2-0      **ICM<2:0>**: Input Capture Mode Select bits

- 111 = Interrupt-Only mode (only supported while in Sleep mode or Idle mode)
- 110 = Simple Capture Event mode – every edge, specified edge first and every edge thereafter
- 101 = Prescaled Capture Event mode – every sixteenth rising edge
- 100 = Prescaled Capture Event mode – every fourth rising edge
- 011 = Simple Capture Event mode – every rising edge
- 010 = Simple Capture Event mode – every falling edge
- 001 = Edge Detect mode – every edge (rising and falling)
- 000 = Input Capture module is disabled

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 16.0 OUTPUT COMPARE

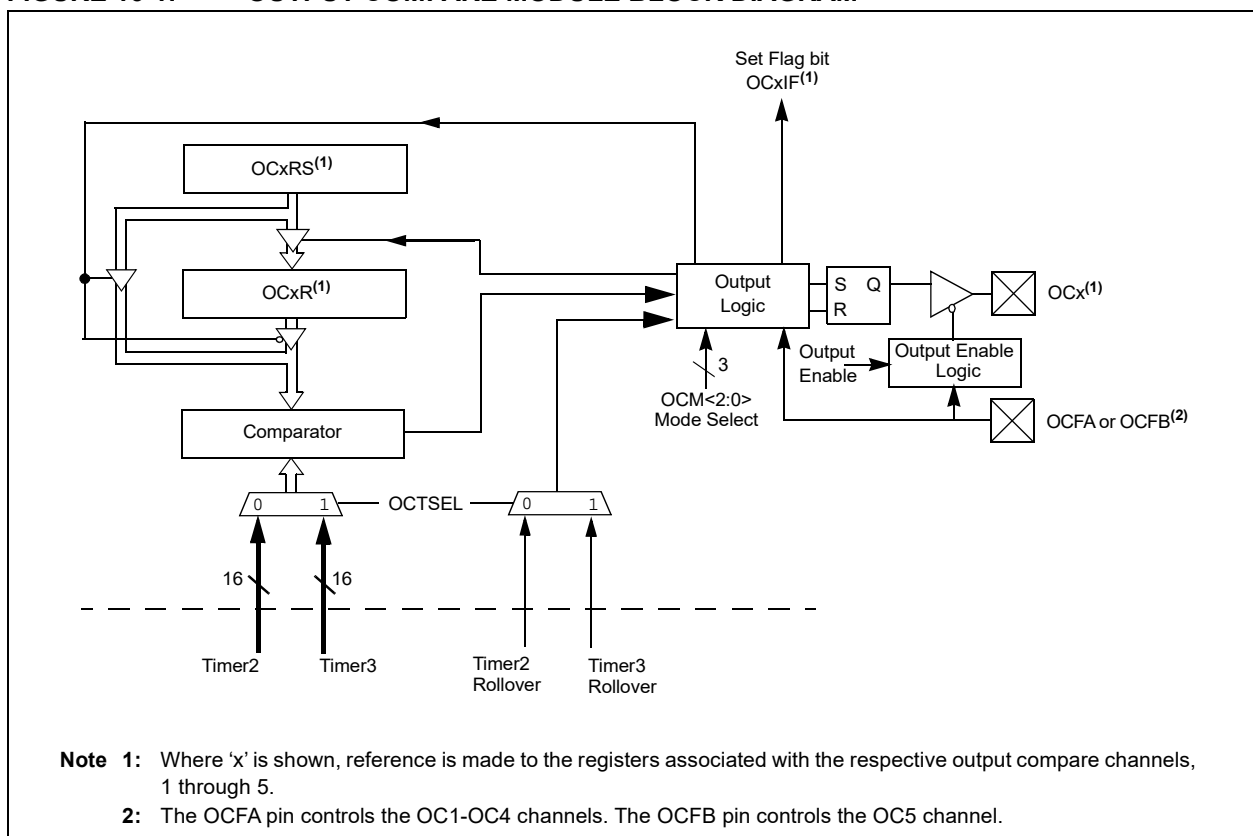

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. "Output Compare"** (DS60001111), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The Output Compare module is used to generate a single pulse or a train of pulses in response to selected time base events. For all modes of operation, the Output Compare module compares the values stored in the OCxR and/or the OCxRS registers to the value in the selected timer. When a match occurs, the Output Compare module generates an event based on the selected mode of operation.

The following are some of the key features:

- Multiple Output Compare Modules in a device
- Programmable interrupt generation on compare event
- Single and Dual Compare modes
- Single and continuous output pulse generation
- Pulse-Width Modulation (PWM) mode
- Hardware-based PWM Fault detection and automatic output disable
- Can operate from either of two available 16-bit time bases or a single 32-bit time base

**FIGURE 16-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM**

**Legend:**

|                   |                  |                                    |
|-------------------|------------------|------------------------------------|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared               |
|                   |                  | x = Bit is unknown                 |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Output Compare Peripheral On bit<sup>(1)</sup>

1 = Output Compare peripheral is enabled  
0 = Output Compare peripheral is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Discontinue module operation when the device enters Idle mode  
0 = Continue module operation when the device enters Idle mode

bit 12-6 **Unimplemented:** Read as '0'

bit 5 **OC32:** 32-bit Compare Mode bit

1 = OCxR<31:0> and/or OCxRS<31:0> are used for comparisons to the 32-bit timer source  
0 = OCxR<15:0> and OCxRS<15:0> are used for comparisons to the 16-bit timer source

bit 4 **OCFLT:** PWM Fault Condition Status bit<sup>(2)</sup>

1 = PWM Fault condition has occurred (cleared in hardware only)  
0 = No PWM Fault condition has occurred

bit 3 **OCTSEL:** Output Compare Timer Select bit

1 = Timer3 is the clock source for this Output Compare module  
0 = Timer2 is the clock source for this Output Compare module

bit 2-0 **OCM<2:0>:** Output Compare Mode Select bits

111 = PWM mode on OCx; Fault pin enabled  
110 = PWM mode on OCx; Fault pin disabled  
101 = Initialize OCx pin low; generate continuous output pulses on OCx pin  
100 = Initialize OCx pin low; generate single output pulse on OCx pin  
011 = Compare event toggles OCx pin  
010 = Initialize OCx pin high; compare event forces OCx pin low  
001 = Initialize OCx pin low; compare event forces OCx pin high  
000 = Output compare peripheral is disabled but continues to draw current

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

**2:** This bit is only used when OCM<2:0> = '111'. It is read as '0' in all other modes.

NOTES:

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 17.0 SERIAL PERIPHERAL INTERFACE (SPI)

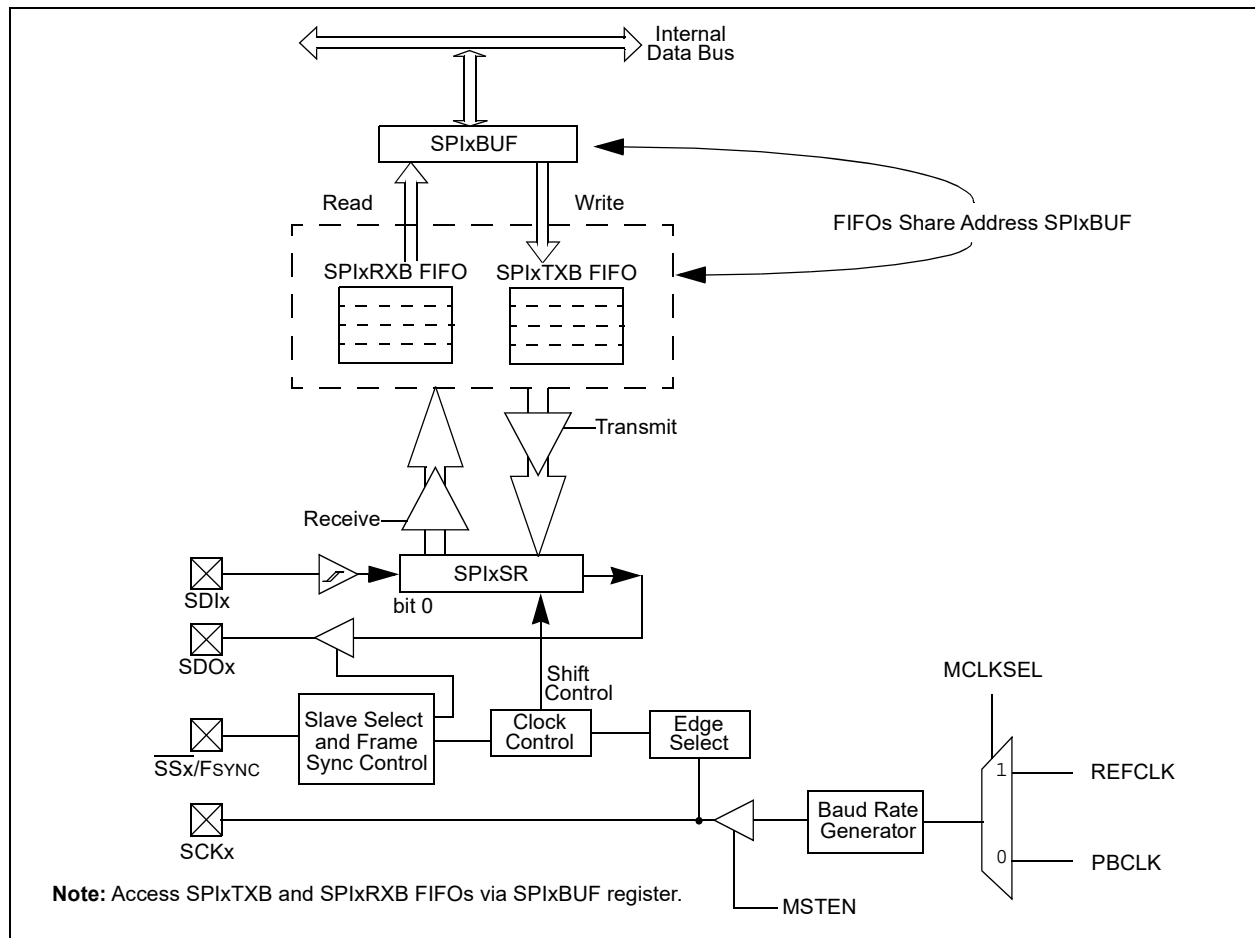

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 23. "Serial Peripheral Interface (SPI)"** (DS60001106), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The SPI module is a synchronous serial interface that is useful for communicating with external peripherals and other microcontrollers. These peripheral devices may be Serial EEPROMs, Shift registers, display drivers, Analog-to-Digital Converters (ADC), etc. The PIC32 SPI module is compatible with Motorola® SPI and SIOP interfaces.

Some of the key features of the SPI module are:

- Master mode and Slave mode support
- Four clock formats
- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
  - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer
- Operation during Sleep and Idle modes
- Audio Codec Support:
  - I<sup>2</sup>S protocol
  - Left-justified

**Legend:**

|                   |                  |                                    |
|-------------------|------------------|------------------------------------|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared               |
|                   |                  | x = Bit is unknown                 |

- bit 31 **FRMEN:** Framed SPI Support bit  
 1 = Framed SPI support is enabled ( $\overline{SSx}$  pin used as FSYNC input/output)  
 0 = Framed SPI support is disabled
- bit 30 **FRMSYNC:** Frame Sync Pulse Direction Control on  $\overline{SSx}$  pin bit (Framed SPI mode only)  
 1 = Frame sync pulse input (Slave mode)  
 0 = Frame sync pulse output (Master mode)
- bit 29 **FRMPOL:** Frame Sync / Slave Select Polarity bit (Framed SPI or Master Transmit modes only)  
 1 = Frame pulse or  $\overline{SSx}$  pin is active-high  
 0 = Frame pulse or  $\overline{SSx}$  pin is active-low
- bit 28 **MSSEN:** Master Mode Slave Select Enable bit  
 1 = Slave select SPI support enabled. The  $\overline{SS}$  pin is automatically driven during transmission in Master mode. Polarity is determined by the FRMPOL bit.  
 0 = Slave select SPI support is disabled.
- bit 27 **FRMSYPW:** Frame Sync Pulse Width bit  
 1 = Frame sync pulse is one character wide  
 0 = Frame sync pulse is one clock wide
- bit 26-24 **FRMCNT<2:0>:** Frame Sync Pulse Counter bits. Controls the number of data characters transmitted per pulse. This bit is only valid in FRAMED\_SYNC mode.  
 111 = Reserved; do not use  
 110 = Reserved; do not use  
 101 = Generate a frame sync pulse on every 32 data characters  
 100 = Generate a frame sync pulse on every 16 data characters  
 011 = Generate a frame sync pulse on every 8 data characters  
 010 = Generate a frame sync pulse on every 4 data characters  
 001 = Generate a frame sync pulse on every 2 data characters  
 000 = Generate a frame sync pulse on every data character
- bit 23 **MCLKSEL:** Master Clock Enable bit<sup>(2)</sup>  
 1 = REFCLK is used by the Baud Rate Generator  
 0 = PBCLK is used by the Baud Rate Generator
- bit 22-18 **Unimplemented:** Read as '0'

- Note 1:** When using the 1:1 PBCLK divisor, the user's software should not read or write the peripheral's SFRs in the SYSCLOCK cycle immediately following the instruction that clears the module's ON bit.
- 2:** This bit can only be written when the ON bit = 0.
- 3:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).
- 4:** When AUDEN = 1, the SPI module functions as if the CKP bit is equal to '1', regardless of the actual value of CKP.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## REGISTER 17-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

- bit 17 **SPIFE**: Frame Sync Pulse Edge Select bit (Framed SPI mode only)  
 1 = Frame synchronization pulse coincides with the first bit clock  
 0 = Frame synchronization pulse precedes the first bit clock
- bit 16 **ENHBUF**: Enhanced Buffer Enable bit<sup>(2)</sup>  
 1 = Enhanced Buffer mode is enabled  
 0 = Enhanced Buffer mode is disabled
- bit 15 **ON**: SPI Peripheral On bit<sup>(1)</sup>  
 1 = SPI Peripheral is enabled  
 0 = SPI Peripheral is disabled
- bit 14 **Unimplemented**: Read as '0'
- bit 13 **SIDL**: Stop in Idle Mode bit  
 1 = Discontinue module operation when the device enters Idle mode  
 0 = Continue module operation when the device enters Idle mode
- bit 12 **DISSDO**: Disable SDOx pin bit  
 1 = SDOx pin is not used by the module. Pin is controlled by associated PORT register  
 0 = SDOx pin is controlled by the module
- bit 11-10 **MODE<32,16>**: 32/16-Bit Communication Select bits  
 When AUDEN = 1:
- | MODE32 | MODE16 | Communication   |
|--------|--------|---|
| 1      | 1      | 24-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame |
| 1      | 0      | 32-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame |
| 0      | 1      | 16-bit Data, 16-bit FIFO, 32-bit Channel/64-bit Frame |
| 0      | 0      | 16-bit Data, 16-bit FIFO, 16-bit Channel/32-bit Frame |
- When AUDEN = 0:
- | MODE32 | MODE16 | Communication |
|--------|--------|---------------|
| 1      | x      | 32-bit        |
| 0      | 1      | 16-bit        |
| 0      | 0      | 8-bit         |
- bit 9 **SMP**: SPI Data Input Sample Phase bit  
 Master mode (MSTEN = 1):  
 1 = Input data sampled at end of data output time  
 0 = Input data sampled at middle of data output time  
 Slave mode (MSTEN = 0):  
 SMP value is ignored when SPI is used in Slave mode. The module always uses SMP = 0.  
 To write a '1' to this bit, the MSTEN value = 1 must first be written.
- bit 8 **CKE**: SPI Clock Edge Select bit<sup>(3)</sup>  
 1 = Serial output data changes on transition from active clock state to Idle clock state (see the CKP bit)  
 0 = Serial output data changes on transition from Idle clock state to active clock state (see the CKP bit)
- bit 7 **SSEN**: Slave Select Enable (Slave mode) bit  
 1 =  $\overline{SSx}$  pin used for Slave mode  
 0 =  $\overline{SSx}$  pin not used for Slave mode, pin controlled by port function.
- bit 6 **CKP**: Clock Polarity Select bit<sup>(4)</sup>  
 1 = Idle state for clock is a high level; active state is a low level  
 0 = Idle state for clock is a low level; active state is a high level

- Note 1:** When using the 1:1 PBCLK divisor, the user's software should not read or write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
- 2:** This bit can only be written when the ON bit = 0.
- 3:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).
- 4:** When AUDEN = 1, the SPI module functions as if the CKP bit is equal to '1', regardless of the actual value of CKP.

## REGISTER 17-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

- bit 5     **MSTEN**: Master Mode Enable bit  
          1 = Master mode  
          0 = Slave mode
- bit 4     **DISSDI**: Disable SDI bit  
          1 = SDI pin is not used by the SPI module (pin is controlled by PORT function)  
          0 = SDI pin is controlled by the SPI module
- bit 3-2   **STXISEL<1:0>**: SPI Transmit Buffer Empty Interrupt Mode bits  
          11 = Interrupt is generated when the buffer is not full (has one or more empty elements)  
          10 = Interrupt is generated when the buffer is empty by one-half or more  
          01 = Interrupt is generated when the buffer is completely empty  
          00 = Interrupt is generated when the last transfer is shifted out of SPISR and transmit operations are complete
- bit 1-0   **SRXISEL<1:0>**: SPI Receive Buffer Full Interrupt Mode bits  
          11 = Interrupt is generated when the buffer is full  
          10 = Interrupt is generated when the buffer is full by one-half or more  
          01 = Interrupt is generated when the buffer is not empty  
          00 = Interrupt is generated when the last word in the receive buffer is read (i.e., buffer is empty)

- Note 1:** When using the 1:1 PBCLK divisor, the user's software should not read or write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
- 2:** This bit can only be written when the ON bit = 0.
- 3:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).
- 4:** When AUDEN = 1, the SPI module functions as if the CKP bit is equal to '1', regardless of the actual value of CKP.

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **SPISGNEXT:** Sign Extend Read Data from the RX FIFO bit

- 1 = Data from RX FIFO is sign extended
- 0 = Data from RX FIFO is not sign extended

bit 14-13 **Unimplemented:** Read as '0'

bit 12 **FRMERREN:** Enable Interrupt Events via FRMERR bit

- 1 = Frame Error overflow generates error events
- 0 = Frame Error does not generate error events

bit 11 **SPIROVEN:** Enable Interrupt Events via SPIROV bit

- 1 = Receive overflow generates error events
- 0 = Receive overflow does not generate error events

bit 10 **SPITUREN:** Enable Interrupt Events via SPITUR bit

- 1 = Transmit underrun generates error events
- 0 = Transmit underrun does not generate error events

bit 9 **IGNROV:** Ignore Receive Overflow bit (for Audio Data Transmissions)

- 1 = A ROV is not a critical error; during ROV data in the FIFO is not overwritten by receive data
- 0 = A ROV is a critical error that stops SPI operation

bit 8 **IGNTUR:** Ignore Transmit Underrun bit (for Audio Data Transmissions)

- 1 = A TUR is not a critical error and zeros are transmitted until the SPIxTXB is not empty
- 0 = A TUR is a critical error that stops SPI operation

bit 7 **AUDEN:** Enable Audio CODEC Support bit<sup>(1)</sup>

- 1 = Audio protocol enabled
- 0 = Audio protocol disabled

bit 6-5 **Unimplemented:** Read as '0'

bit 3 **AUDMONO:** Transmit Audio Data Format bit<sup>(1,2)</sup>

- 1 = Audio data is mono (Each data word is transmitted on both left and right channels)
- 0 = Audio data is stereo

bit 2 **Unimplemented:** Read as '0'

bit 1-0 **AUDMOD<1:0>:** Audio Protocol Mode bit<sup>(1,2)</sup>

- 11 = PCM/DSP mode
- 10 = Right-Justified mode
- 01 = Left-Justified mode
- 00 = I<sup>2</sup>S mode

**Note 1:** This bit can only be written when the ON bit = 0.

**Note 2:** This bit is only valid for AUDEN = 1.

|                   |                   |  |
|-------------------|-------------------|--|
| <b>Legend:</b>    | C = Clearable bit | HS = Set in hardware                         |
| R = Readable bit  | W = Writable bit  | U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set  | '0' = Bit is cleared      x = Bit is unknown |

bit 31-29 **Unimplemented:** Read as '0'

bit 28-24 **RXBUFELM<4:0>:** Receive Buffer Element Count bits (valid only when ENHBUF = 1)

bit 23-21 **Unimplemented:** Read as '0'

bit 20-16 **TXBUFELM<4:0>:** Transmit Buffer Element Count bits (valid only when ENHBUF = 1)

bit 15-13 **Unimplemented:** Read as '0'

bit 12 **FRMERR:** SPI Frame Error status bit

1 = Frame error detected

0 = No Frame error detected

This bit is only valid when FRMEN = 1.

bit 11 **SPIBUSY:** SPI Activity Status bit

1 = SPI peripheral is currently busy with some transactions

0 = SPI peripheral is currently idle

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **SPITUR:** Transmit Under Run bit

1 = Transmit buffer has encountered an underrun condition

0 = Transmit buffer has no underrun condition

This bit is only valid in Framed Sync mode; the underrun condition must be cleared by disabling (ON bit = 0) and re-enabling (ON bit = 1) the module, or writing a '0' to SPITUR.

bit 7 **SRMT:** Shift Register Empty bit (valid only when ENHBUF = 1)

1 = When SPI module shift register is empty

0 = When SPI module shift register is not empty

bit 6 **SPIROV:** Receive Overflow Flag bit

1 = A new data is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.

0 = No overflow has occurred

This bit is set in hardware; can bit only be cleared by disabling (ON bit = 0) and re-enabling (ON bit = 1) the module, or by writing a '0' to SPIROV.

bit 5 **SPIRBE:** RX FIFO Empty bit (valid only when ENHBUF = 1)

1 = RX FIFO is empty (CRPTR = SWPTR)

0 = RX FIFO is not empty (CRPTR ≠ SWPTR)

bit 4 **Unimplemented:** Read as '0'

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 17-3: SPIxSTAT: SPI STATUS REGISTER

- bit 3     **SPITBE**: SPI Transmit Buffer Empty Status bit  
1 = Transmit buffer, SPIxTXB is empty  
0 = Transmit buffer, SPIxTXB is not empty  
Automatically set in hardware when SPI transfers data from SPIxTXB to SPIxSR.  
Automatically cleared in hardware when SPIxBUF is written to, loading SPIxTXB.
- bit 2     **Unimplemented**: Read as '0'
- bit 1     **SPITBF**: SPI Transmit Buffer Full Status bit  
1 = Transmit not yet started, SPITXB is full  
0 = Transmit buffer is not full  
Standard Buffer Mode:  
Automatically set in hardware when the core writes to the SPIBUF location, loading SPITXB.  
Automatically cleared in hardware when the SPI module transfers data from SPITXB to SPISR.  
Enhanced Buffer Mode:  
Set when CWPTR + 1 = SRPTR; cleared otherwise
- bit 0     **SPIRBF**: SPI Receive Buffer Full Status bit  
1 = Receive buffer, SPIxRXB is full  
0 = Receive buffer, SPIxRXB is not full  
Standard Buffer Mode:  
Automatically set in hardware when the SPI module transfers data from SPIxSR to SPIxRXB.  
Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.  
Enhanced Buffer Mode:  
Set when SWPTR + 1 = CRPTR; cleared otherwise

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 18.0 INTER-INTEGRATED CIRCUIT (I<sup>2</sup>C)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. “Inter-Integrated Circuit (I<sup>2</sup>C)”** (DS60001116), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The I<sup>2</sup>C module provides complete hardware support for both Slave and Multi-Master modes of the I<sup>2</sup>C serial communication standard. [Figure 18-1](#) illustrates the I<sup>2</sup>C module block diagram.

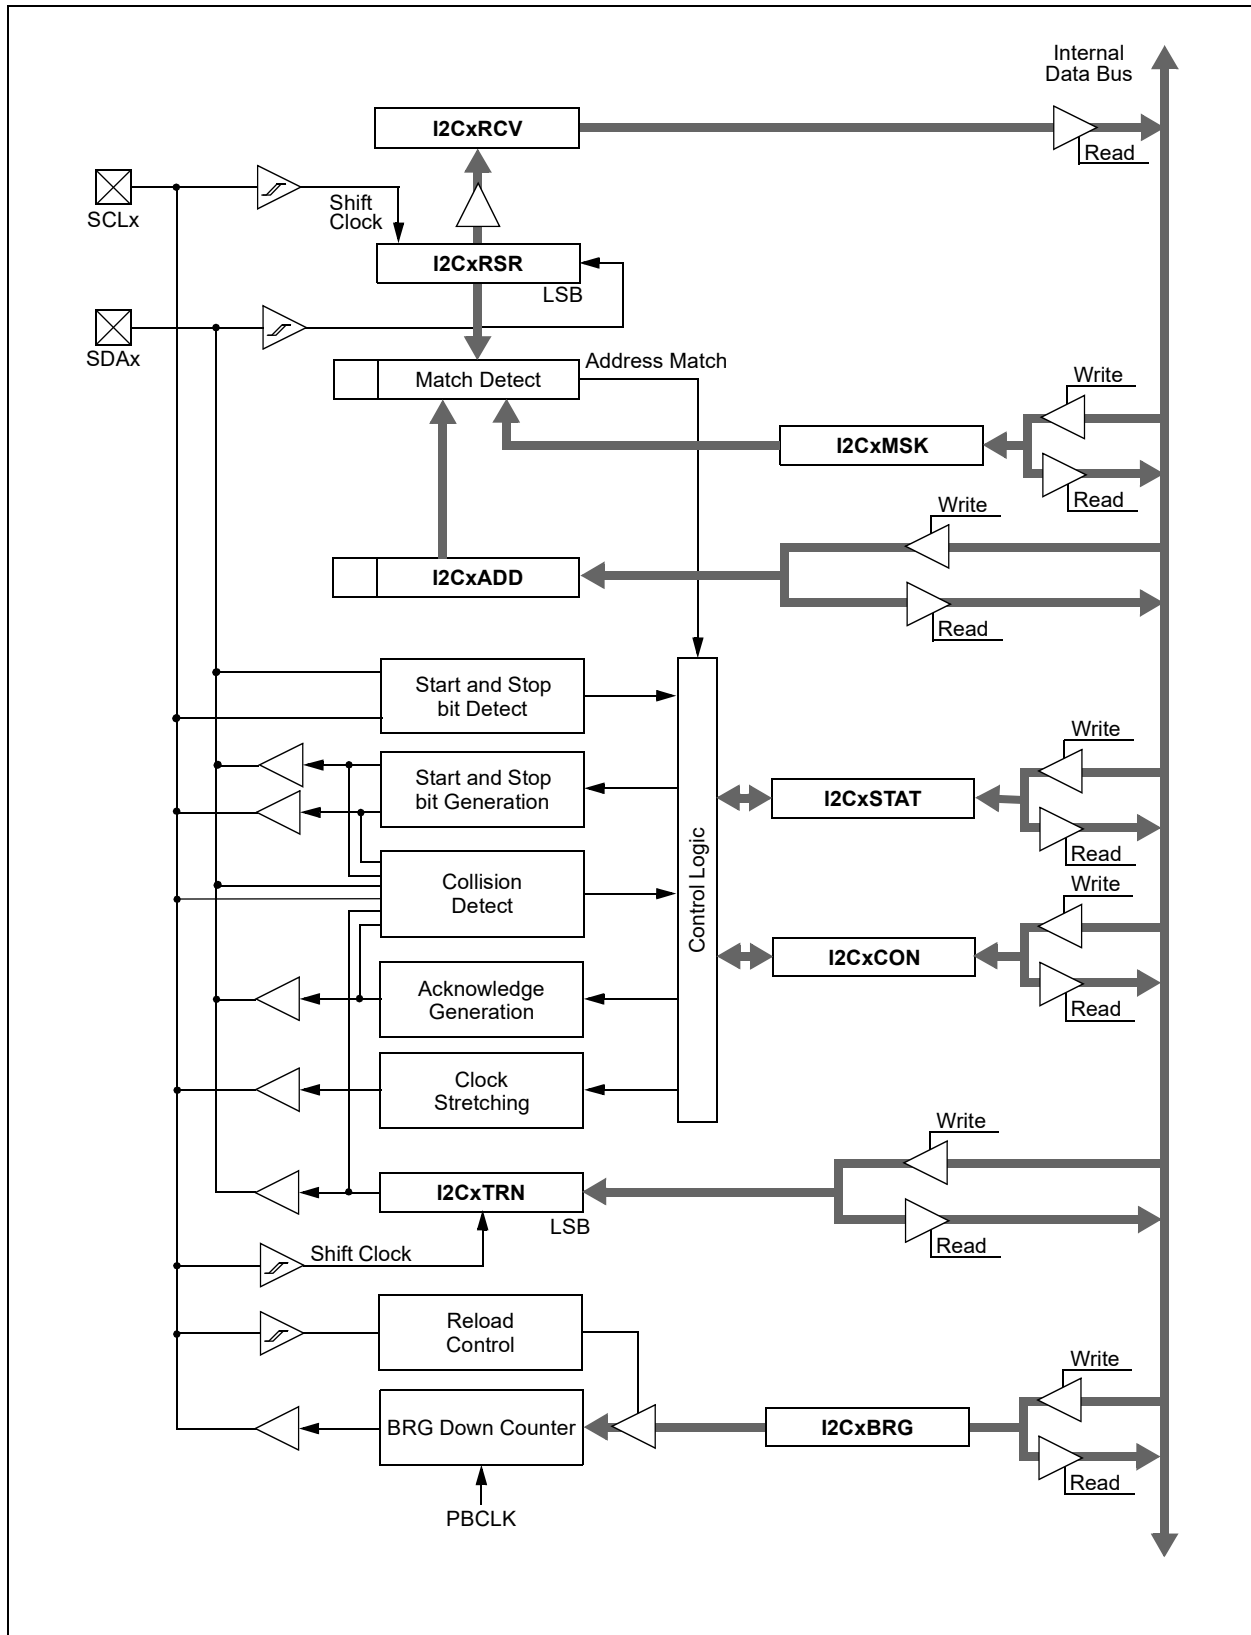

Each I<sup>2</sup>C module has a 2-pin interface: the SCLx pin is clock and the SDAx pin is data.

Each I<sup>2</sup>C module offers the following key features:

- I<sup>2</sup>C interface supporting both master and slave operation
- I<sup>2</sup>C Slave mode supports 7-bit and 10-bit addressing
- I<sup>2</sup>C Master mode supports 7-bit and 10-bit addressing
- I<sup>2</sup>C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the I<sup>2</sup>C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I<sup>2</sup>C supports multi-master operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking

|-------------------|------------------------------------|
| <b>Legend:</b>    | HC = Cleared in Hardware           |
| R = Readable bit  | W = Writable bit                   |
| -n = Value at POR | '1' = Bit is set                   |
|                   | '0' = Bit is cleared               |
|                   | x = Bit is unknown                 |
|                   | U = Unimplemented bit, read as '0' |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** I<sup>2</sup>C Enable bit<sup>(1)</sup>

- 1 = Enables the I<sup>2</sup>C module and configures the SDA and SCL pins as serial port pins
- 0 = Disables the I<sup>2</sup>C module; all I<sup>2</sup>C pins are controlled by PORT functions

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

- 1 = Discontinue module operation when the device enters Idle mode
- 0 = Continue module operation when the device enters Idle mode

bit 12 **SCLREL:** SCLx Release Control bit (when operating as I<sup>2</sup>C slave)

- 1 = Release SCLx clock
- 0 = Hold SCLx clock low (clock stretch)

If STREN = 1:

Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of slave transmission. Hardware clear at end of slave reception.

If STREN = 0:

Bit is R/S (i.e., software can only write '1' to release clock). Hardware clear at beginning of slave transmission.

bit 11 **STRICT:** Strict I<sup>2</sup>C Reserved Address Rule Enable bit

- 1 = Strict reserved addressing is enforced. Device does not respond to reserved address space or generate addresses in reserved address space.
- 0 = Strict I<sup>2</sup>C Reserved Address Rule not enabled

bit 10 **A10M:** 10-bit Slave Address bit

- 1 = I2CxADD is a 10-bit slave address
- 0 = I2CxADD is a 7-bit slave address

bit 9 **DISSLW:** Disable Slew Rate Control bit

- 1 = Slew rate control disabled
- 0 = Slew rate control enabled

bit 8 **SMEN:** SMBus Input Levels bit

- 1 = Enable I/O pin thresholds compliant with SMBus specification
- 0 = Disable SMBus input thresholds

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## REGISTER 18-1: I2CxCON: I<sup>2</sup>C CONTROL REGISTER (CONTINUED)

- bit 7 **GCEN:** General Call Enable bit (when operating as I<sup>2</sup>C slave)  
1 = Enable interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)  
0 = General call address is disabled
- bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I<sup>2</sup>C slave)  
Used in conjunction with SCLREL bit.  
1 = Enable software or receive clock stretching  
0 = Disable software or receive clock stretching
- bit 5 **ACKDT:** Acknowledge Data bit (when operating as I<sup>2</sup>C master, applicable during master receive)  
Value that is transmitted when the software initiates an Acknowledge sequence.  
1 = Send a NACK during an Acknowledge sequence  
0 = Send an ACK during an Acknowledge sequence
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit (when operating as I<sup>2</sup>C master, applicable during master receive)  
1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit. Hardware clear at end of master Acknowledge sequence.  
0 = Acknowledge sequence not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I<sup>2</sup>C master)  
1 = Enables Receive mode for I<sup>2</sup>C. Hardware clear at end of eighth bit of master receive data byte.  
0 = Receive sequence not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I<sup>2</sup>C master)  
1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of master Stop sequence.  
0 = Stop condition not in progress
- bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I<sup>2</sup>C master)  
1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of master Repeated Start sequence.  
0 = Repeated Start condition not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I<sup>2</sup>C master)  
1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of master Start sequence.  
0 = Start condition not in progress

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

| <b>Legend:</b>    | HS = Set in hardware | HSC = Hardware set/cleared                  |
| R = Readable bit  | W = Writable bit     | U = Unimplemented bit, read as '0'          |
| -n = Value at POR | '1' = Bit is set     | '0' = Bit is cleared      C = Clearable bit |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ACKSTAT:** Acknowledge Status bit (when operating as I<sup>2</sup>C master, applicable to master transmit operation)  
 1 = Acknowledge was not received from slave  
 0 = Acknowledge was received from slave  
 Hardware set or clear at end of slave Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I<sup>2</sup>C master, applicable to master transmit operation)  
 1 = Master transmit is in progress (8 bits + ACK)  
 0 = Master transmit is not in progress  
 Hardware set at beginning of master transmission. Hardware clear at end of slave Acknowledge.

bit 13-11 **Unimplemented:** Read as '0'

bit 10 **BCL:** Master Bus Collision Detect bit  
 1 = A bus collision has been detected during a master operation  
 0 = No collision  
 Hardware set at detection of bus collision. This condition can only be cleared by disabling (ON bit = 0) and re-enabling (ON bit = 1) the module.

bit 9 **GCSTAT:** General Call Status bit  
 1 = General call address was received  
 0 = General call address was not received  
 Hardware set when address matches general call address. Hardware clear at Stop detection.

bit 8 **ADD10:** 10-bit Address Status bit  
 1 = 10-bit address was matched  
 0 = 10-bit address was not matched  
 Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.

bit 7 **IWCOL:** Write Collision Detect bit  
 1 = An attempt to write the I2CxTRN register failed because the I<sup>2</sup>C module is busy  
 0 = No collision  
 Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).

bit 6 **I2COV:** Receive Overflow Flag bit  
 1 = A byte was received while the I2CxRCV register is still holding the previous byte  
 0 = No overflow  
 Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

bit 5 **D\_A:** Data/Address bit (when operating as I<sup>2</sup>C slave)  
 1 = Indicates that the last byte received was data  
 0 = Indicates that the last byte received was device address  
 Hardware clear at device address match. Hardware set by reception of slave byte.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 18-2: I2CxSTAT: I<sup>2</sup>C STATUS REGISTER (CONTINUED)

- bit 4     **P:** Stop bit  
1 = Indicates that a Stop bit has been detected last  
0 = Stop bit was not detected last  
Hardware set or clear when Start, Repeated Start or Stop detected.
- bit 3     **S:** Start bit  
1 = Indicates that a Start (or Repeated Start) bit has been detected last  
0 = Start bit was not detected last  
Hardware set or clear when Start, Repeated Start or Stop detected.
- bit 2     **R\_W:** Read/Write Information bit (when operating as I<sup>2</sup>C slave)  
1 = Read – indicates data transfer is output from slave  
0 = Write – indicates data transfer is input to slave  
Hardware set or clear after reception of I<sup>2</sup>C device address byte.
- bit 1     **RBF:** Receive Buffer Full Status bit  
1 = Receive complete, I2CxRCV is full  
0 = Receive not complete, I2CxRCV is empty  
Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.
- bit 0     **TBF:** Transmit Buffer Full Status bit  
1 = Transmit in progress, I2CxTRN is full  
0 = Transmit complete, I2CxTRN is empty  
Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

NOTES:

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 19.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. “Universal Asynchronous Receiver Transmitter (UART)”** (DS60001107), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

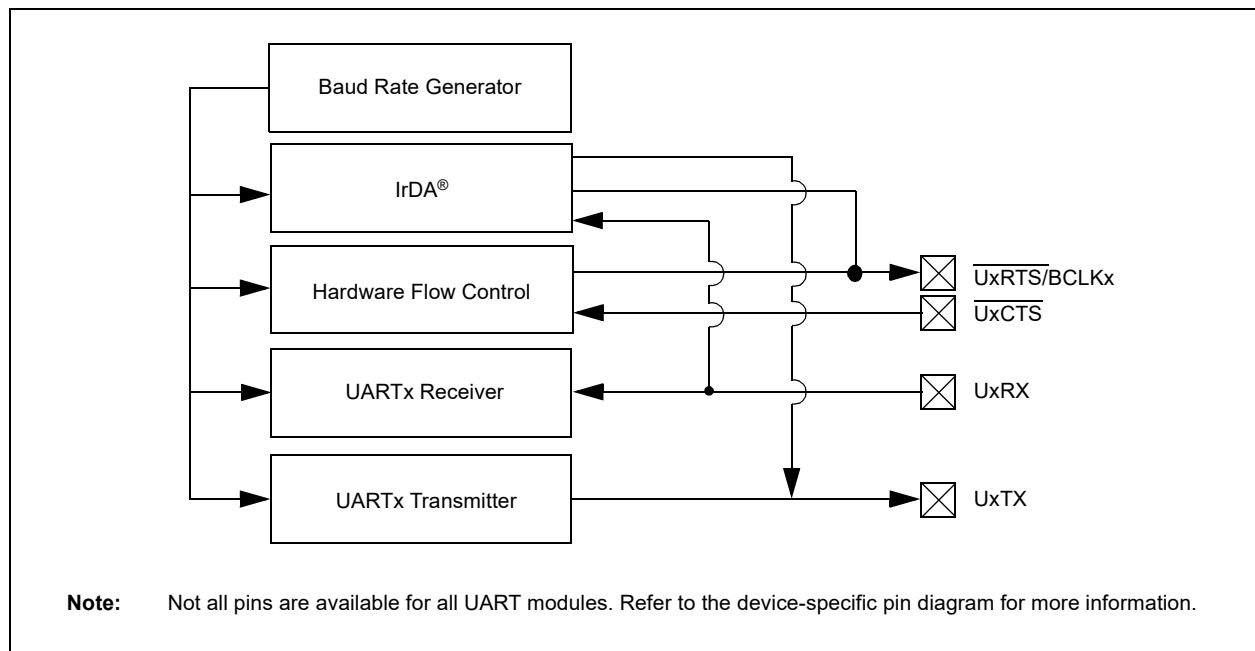

The UART module is one of the serial I/O modules available in PIC32MX1XX/2XX 28/36/44-pin Family devices. The UART is a full-duplex, asynchronous communication channel that communicates with peripheral devices and personal computers through protocols, such as RS-232, RS-485, LIN, and IrDA®. The UART module also supports the hardware flow control option, with  $\overline{UxCTS}$  and  $\overline{UxRTS}$  pins, and also includes an IrDA encoder and decoder.

Key features of the UART module include:

- Full-duplex, 8-bit or 9-bit data transmission
- Even, Odd or No Parity options (for 8-bit data)
- One or two Stop bits
- Hardware auto-baud feature
- Hardware flow control option
- Fully integrated Baud Rate Generator (BRG) with 16-bit prescaler
- Baud rates ranging from 38 bps to 12.5 Mbps at 50 MHz
- 8-level deep First In First Out (FIFO) transmit data buffer
- 8-level deep FIFO receive data buffer
- Parity, framing and buffer overrun error detection
- Support for interrupt-only on address detect (9th bit = 1)
- Separate transmit and receive interrupts
- Loopback mode for diagnostic support
- LIN protocol support
- IrDA encoder and decoder with 16x baud clock output for external IrDA encoder/decoder support

Figure 19-1 illustrates a simplified block diagram of the UART module.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

- bit 31-16 **Unimplemented:** Read as '0'
- bit 15 **ON:** UARTx Enable bit<sup>(1)</sup>
  - 1 = UARTx is enabled. UARTx pins are controlled by UARTx as defined by the UEN<1:0> and UTXEN control bits.
  - 0 = UARTx is disabled. All UARTx pins are controlled by corresponding bits in the PORTx, TRISx and LATx registers; UARTx power consumption is minimal.
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **SIDL:** Stop in Idle Mode bit
  - 1 = Discontinue module operation when the device enters Idle mode
  - 0 = Continue module operation when the device enters Idle mode
- bit 12 **IREN:** IrDA Encoder and Decoder Enable bit
  - 1 = IrDA is enabled
  - 0 = IrDA is disabled
- bit 11 **RTSMD:** Mode Selection for  $\overline{\text{UxRTS}}$  Pin bit
  - 1 =  $\overline{\text{UxRTS}}$  pin is in Simplex mode
  - 0 =  $\overline{\text{UxRTS}}$  pin is in Flow Control mode
- bit 10 **Unimplemented:** Read as '0'
- bit 9-8 **UEN<1:0>:** UARTx Enable bits
  - 11 = UxTX, UxRX and UxBCLK pins are enabled and used;  $\overline{\text{UxCTS}}$  pin is controlled by corresponding bits in the PORTx register
  - 10 = UxTX, UxRX,  $\overline{\text{UxCTS}}$  and  $\overline{\text{UxRTS}}$  pins are enabled and used
  - 01 = UxTX, UxRX and  $\overline{\text{UxRTS}}$  pins are enabled and used;  $\overline{\text{UxCTS}}$  pin is controlled by corresponding bits in the PORTx register
  - 00 = UxTX and UxRX pins are enabled and used;  $\overline{\text{UxCTS}}$  and  $\overline{\text{UxRTS}}$ /UxBCLK pins are controlled by corresponding bits in the PORTx register
- bit 7 **WAKE:** Enable Wake-up on Start bit Detect During Sleep Mode bit
  - 1 = Wake-up enabled
  - 0 = Wake-up disabled
- bit 6 **LPBACK:** UARTx Loopback Mode Select bit
  - 1 = Loopback mode is enabled
  - 0 = Loopback mode is disabled

**Note 1:** When using 1:1 PBCLK divisor, the user software should not read/write the peripheral SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 19-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

- bit 5     **ABAUD**: Auto-Baud Enable bit  
1 = Enable baud rate measurement on the next character – requires reception of Sync character (0x55);  
cleared by hardware upon completion  
0 = Baud rate measurement disabled or completed
- bit 4     **RXINV**: Receive Polarity Inversion bit  
1 = UxRX Idle state is '0'  
0 = UxRX Idle state is '1'
- bit 3     **BRGH**: High Baud Rate Enable bit  
1 = High-Speed mode – 4x baud clock enabled  
0 = Standard Speed mode – 16x baud clock enabled
- bit 2-1   **PDSEL<1:0>**: Parity and Data Selection bits  
11 = 9-bit data, no parity  
10 = 8-bit data, odd parity  
01 = 8-bit data, even parity  
00 = 8-bit data, no parity
- bit 0     **STSEL**: Stop Selection bit  
1 = 2 Stop bits  
0 = 1 Stop bit

**Note 1:** When using 1:1 PBCLK divisor, the user software should not read/write the peripheral SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

|           | URXISEL<1:0>   |                | ADDEN          | RIDLE          | PERR           | FERR           | OERR          | URXDA         |

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-25 **Unimplemented:** Read as '0'

bit 24 **ADM\_EN:** Automatic Address Detect Mode Enable bit

- 1 = Automatic Address Detect mode is enabled
- 0 = Automatic Address Detect mode is disabled

bit 23-16 **ADDR<7:0>:** Automatic Address Mask bits

When the ADM\_EN bit is '1', this value defines the address character to use for automatic address detection.

bit 15-14 **UTXISEL<1:0>:** TX Interrupt Mode Selection bits

- 11 = Reserved, do not use
- 10 = Interrupt is generated and asserted while the transmit buffer is empty
- 01 = Interrupt is generated and asserted when all characters have been transmitted
- 00 = Interrupt is generated and asserted while the transmit buffer contains at least one empty space

bit 13 **UTXINV:** Transmit Polarity Inversion bit

If IrDA mode is disabled (i.e., IREN (UxMODE<12>) is '0'):  
 1 = UxTX Idle state is '0'  
 0 = UxTX Idle state is '1'

If IrDA mode is enabled (i.e., IREN (UxMODE<12>) is '1'):  
 1 = IrDA encoded UxTX Idle state is '1'  
 0 = IrDA encoded UxTX Idle state is '0'

bit 12 **URXEN:** Receiver Enable bit

- 1 = UARTx receiver is enabled. UxRX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx receiver is disabled. UxRX pin is ignored by the UARTx module. UxRX pin is controlled by port.

bit 11 **UTXBRK:** Transmit Break bit

- 1 = Send Break on next transmission. Start bit followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
- 0 = Break transmission is disabled or completed

bit 10 **UTXEN:** Transmit Enable bit

- 1 = UARTx transmitter is enabled. UxTX pin is controlled by UARTx (if ON = 1).
- 0 = UARTx transmitter is disabled. Any pending transmission is aborted and buffer is reset. UxTX pin is controlled by port.

bit 9 **UTXBF:** Transmit Buffer Full Status bit (read-only)

- 1 = Transmit buffer is full
- 0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register is Empty bit (read-only)

- 1 = Transmit shift register is empty and transmit buffer is empty (the last transmission has completed)
- 0 = Transmit shift register is not empty, a transmission is in progress or queued in the transmit buffer

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

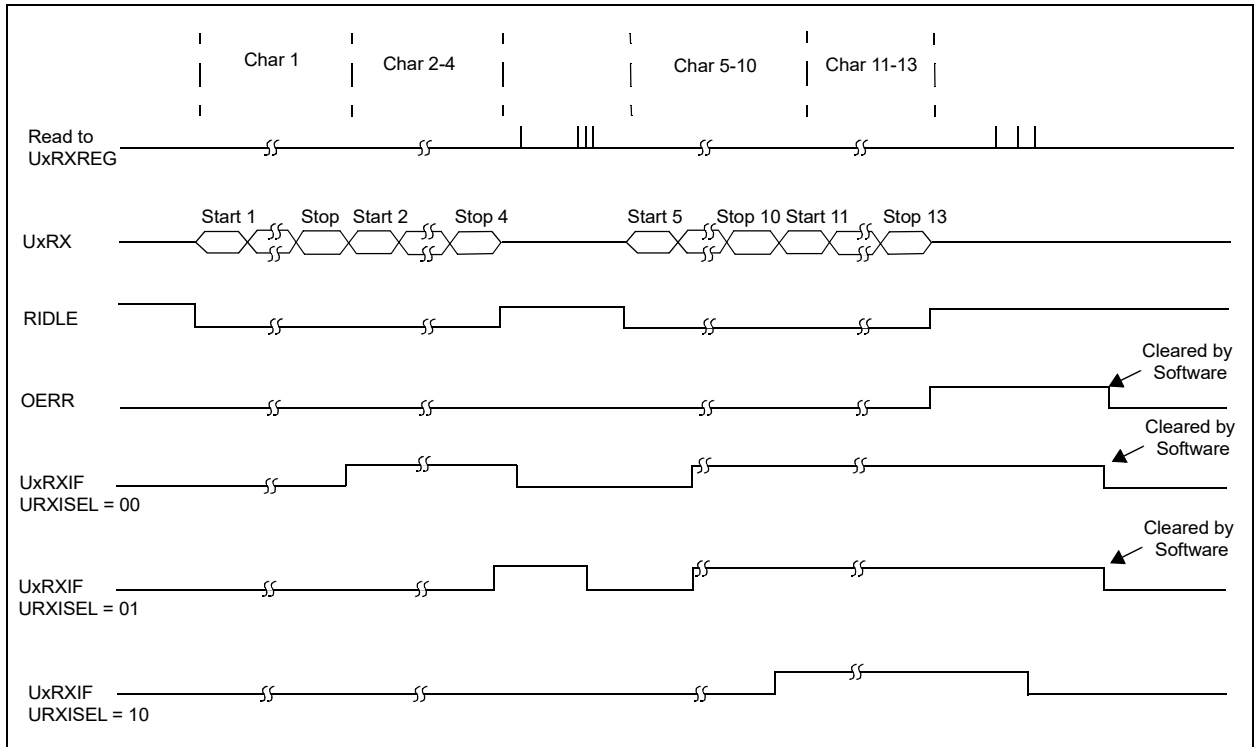

## REGISTER 19-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 7-6 **URXISEL<1:0>**: Receive Interrupt Mode Selection bit  
11 = Reserved; do not use  
10 = Interrupt flag bit is asserted while receive buffer is 3/4 or more full (i.e., has 6 or more data characters)  
01 = Interrupt flag bit is asserted while receive buffer is 1/2 or more full (i.e., has 4 or more data characters)  
00 = Interrupt flag bit is asserted while receive buffer is not empty (i.e., has at least 1 data character)
- bit 5 **ADDEN**: Address Character Detect bit (bit 8 of received data = 1)  
1 = Address Detect mode is enabled. If 9-bit mode is not selected, this control bit has no effect.  
0 = Address Detect mode is disabled
- bit 4 **RIDLE**: Receiver Idle bit (read-only)  
1 = Receiver is Idle  
0 = Data is being received
- bit 3 **PERR**: Parity Error Status bit (read-only)  
1 = Parity error has been detected for the current character  
0 = Parity error has not been detected
- bit 2 **FERR**: Framing Error Status bit (read-only)  
1 = Framing error has been detected for the current character  
0 = Framing error has not been detected
- bit 1 **OERR**: Receive Buffer Overrun Error Status bit.  
This bit is set in hardware and can only be cleared (= 0) in software. Clearing a previously set OERR bit resets the receiver buffer and the RSR to an empty state.  
1 = Receive buffer has overflowed  
0 = Receive buffer has not overflowed
- bit 0 **URXDA**: Receive Buffer Data Available bit (read-only)  
1 = Receive buffer has data, at least one more character can be read  
0 = Receive buffer is empty

NOTES:

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 20.0 PARALLEL MASTER PORT (PMP)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. “Parallel Master Port (PMP)”** (DS60001128), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

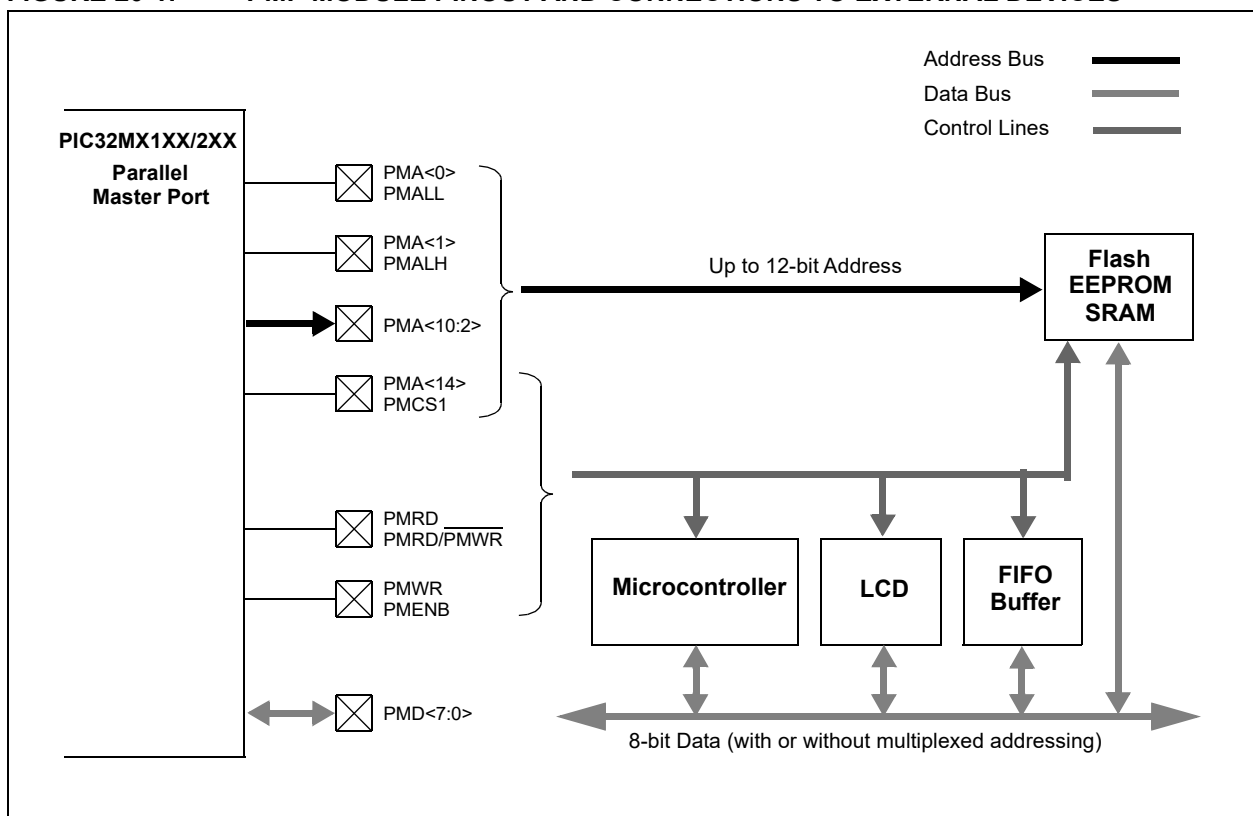

The PMP is a parallel 8-bit input/output module specifically designed to communicate with a wide variety of parallel devices, such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP module is highly configurable.

Key features of the PMP module include:

- Fully multiplexed address/data mode
- Demultiplexed or partially multiplexed address/data mode
  - up to 11 address lines with single Chip Select
  - up to 12 address lines without Chip Select
- One Chip Select line
- Programmable strobe options
  - Individual read and write strobes or;
  - Read/write strobe with enable strobe
- Address auto-increment/auto-decrement
- Programmable address/data multiplexing
- Programmable polarity on control signals
- Legacy parallel slave port support
- Enhanced parallel slave support
  - Address support
  - 4-byte deep auto-incrementing buffer
- Programmable Wait states
- Selectable input voltage levels

Figure 20-1 illustrates the PMP module block diagram.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

- bit 31-16 **Unimplemented:** Read as '0'
- bit 15 **ON:** Parallel Master Port Enable bit<sup>(1)</sup>
  - 1 = PMP enabled
  - 0 = PMP disabled, no off-chip access performed
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **SIDL:** Stop in Idle Mode bit
  - 1 = Discontinue module operation when the device enters Idle mode
  - 0 = Continue module operation when the device enters Idle mode
- bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits
  - 11 = Lower 8 bits of address are multiplexed on PMD<7:0> pins; upper 8 bits are not used
  - 10 = All 16 bits of address are multiplexed on PMD<7:0> pins
  - 01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper bits are on PMA<10:8> and PMA<14>
  - 00 = Address and data appear on separate pins
- bit 10 **PMP TTL:** PMP Module TTL Input Buffer Select bit
  - 1 = PMP module uses TTL input buffers
  - 0 = PMP module uses Schmitt Trigger input buffer
- bit 9 **PTWREN:** Write Enable Strobe Port Enable bit
  - 1 = PMWR/PMENB port enabled
  - 0 = PMWR/PMENB port disabled
- bit 8 **PTRDEN:** Read/Write Strobe Port Enable bit
  - 1 = PMRD/PMWR port enabled
  - 0 = PMRD/PMWR port disabled
- bit 7-6 **CSF<1:0>:** Chip Select Function bits<sup>(2)</sup>
  - 11 = Reserved
  - 10 = PMCS1 functions as Chip Select
  - 01 = PMCS1 functions as PMA<14>
  - 00 = PMCS1 functions as PMA<14>
- bit 5 **ALP:** Address Latch Polarity bit<sup>(2)</sup>
  - 1 = Active-high (PMALL and PMALH)
  - 0 = Active-low (PMALL and PMALH)

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON control bit.

**2:** These bits have no effect when their corresponding pins are used as address lines.

### Legend:

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **BUSY:** Busy bit (Master mode only)

- 1 = Port is busy
- 0 = Port is not busy

bit 14-13 **IRQM<1:0>:** Interrupt Request Mode bits <sup>(3)</sup>

- 11 = Reserved, do not use
- 10 = Interrupt generated when Read Buffer 3 is read or Write Buffer 3 is written (Buffered PSP mode) or on a read or write operation when PMA<1:0> = 11 (Addressable Slave mode only)
- 01 = Interrupt generated at the end of the read/write cycle
- 00 = No interrupt generated

bit 12-11 **INCM<1:0>:** Increment Mode bits

- 11 = Slave mode read and write buffers auto-increment (MODE<1:0> = 00 only)
- 10 = Decrement ADDR<10:2> and ADDR<14> by 1 every read/write cycle<sup>(2)</sup>
- 01 = Increment ADDR<10:2> and ADDR<14> by 1 every read/write cycle<sup>(2)</sup>
- 00 = No increment or decrement of address

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **MODE<1:0>:** Parallel Port Mode Select bits

- 11 = Master mode 1 (PMCS1, PMRD/PMWR, PMENB, PMA<x:0>, and PMD<7:0>)
- 10 = Master mode 2 (PMCS1, PMRD, PMWR, PMA<x:0>, and PMD<7:0>)
- 01 = Enhanced Slave mode, control signals (PMRD, PMWR, PMCS1, PMD<7:0>, and PMA<1:0>)
- 00 = Legacy Parallel Slave Port, control signals (PMRD, PMWR, PMCS1, and PMD<7:0>)

bit 7-6 **WAITB<1:0>:** Data Setup to Read/Write Strobe Wait States bits<sup>(1)</sup>

- 11 = Data wait of 4 TPB; multiplexed address phase of 4 TPB
- 10 = Data wait of 3 TPB; multiplexed address phase of 3 TPB
- 01 = Data wait of 2 TPB; multiplexed address phase of 2 TPB
- 00 = Data wait of 1 TPB; multiplexed address phase of 1 TPB (default)

**Note 1:** Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK cycle for a write operation; WAITB = 1 TPBCLK cycle, WAITE = 0 TPBCLK cycles for a read operation.

**2:** Address bit A14 is not subject to auto-increment/decrement if configured as Chip Select CS1.

**3:** These bits only control generating the Parallel Master Port (PMP) interrupt. The Parallel Master Port Error (PMPE) is always generated.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 20-2: PPMODE: PARALLEL PORT MODE REGISTER (CONTINUED)

bit 5-2 **WAITM<3:0>**: Data Read/Write Strobe Wait States bits<sup>(1)</sup>

1111 = Wait of 16 TPB

.

.

0001 = Wait of 2 TPB

0000 = Wait of 1 TPB (default)

bit 1-0 **WAITE<1:0>**: Data Hold After Read/Write Strobe Wait States bits<sup>(1)</sup>

11 = Wait of 4 TPB

10 = Wait of 3 TPB

01 = Wait of 2 TPB

00 = Wait of 1 TPB (default)

For Read operations:

11 = Wait of 3 TPB

10 = Wait of 2 TPB

01 = Wait of 1 TPB

00 = Wait of 0 TPB (default)

- Note 1:** Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK cycle for a write operation; WAITB = 1 TPBCLK cycle, WAITE = 0 TPBCLK cycles for a read operation.
- 2:** Address bit A14 is not subject to auto-increment/decrement if configured as Chip Select CS1.
- 3:** These bits only control generating the Parallel Master Port (PMP) interrupt. The Parallel Master Port Error (PMPE) is always generated.

|-------------------|-------------------|--|
| <b>Legend:</b>    | HS = Hardware Set | SC = Cleared by Software                     |
| R = Readable bit  | W = Writable bit  | U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set  | '0' = Bit is cleared      x = Bit is unknown |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **IBF:** Input Buffer Full Status bit

- 1 = All writable input buffer registers are full
- 0 = Some or all of the writable input buffer registers are empty

bit 14 **IBOV:** Input Buffer Overflow Status bit <sup>(1)</sup>

- 1 = A write attempt to a full input byte buffer occurred (must be cleared in software)
- 0 = No overflow occurred

bit 13-12 **Unimplemented:** Read as '0'

bit 11-8 **IBxF:** Input Buffer 'x' Status Full bits

- 1 = Input Buffer contains data that has not been read (reading buffer will clear this bit)
- 0 = Input Buffer does not contain any unread data

bit 7 **OBE:** Output Buffer Empty Status bit

- 1 = All readable output buffer registers are empty
- 0 = Some or all of the readable output buffer registers are full

bit 6 **OBUF:** Output Buffer Underflow Status bit <sup>(1)</sup>

- 1 = A read occurred from an empty output byte buffer (must be cleared in software)
- 0 = No underflow occurred

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **OBxE:** Output Buffer 'x' Status Empty bits

- 1 = Output buffer is empty (writing data to the buffer will clear this bit)
- 0 = Output buffer contains data that has not been transmitted

**Note 1:** This will generate a PMPE - Parallel Master Port Error interrupt.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 21.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

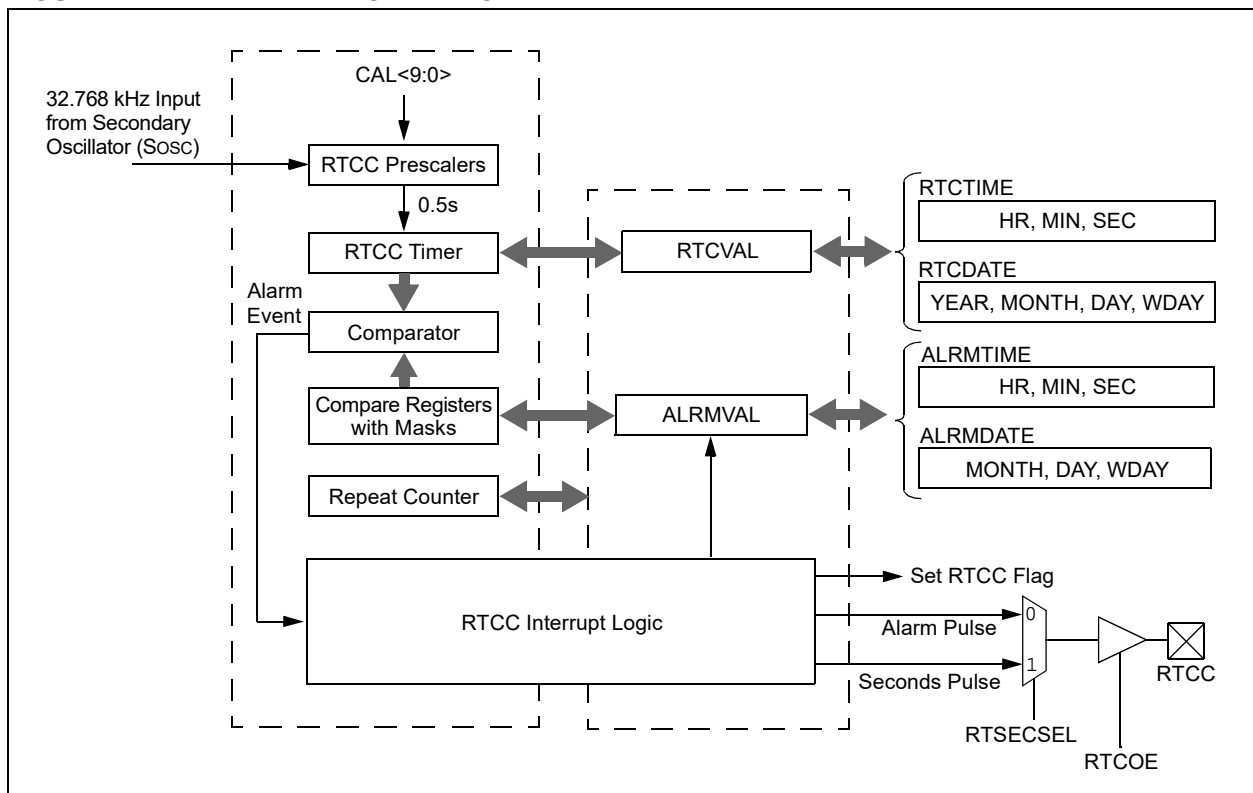

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. “Real-Time Clock and Calendar (RTCC)”** (DS60001125), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The PIC32 RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

Following are some of the key features of this module:

- Time: hours, minutes and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: day, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month and one year
- Alarm repeat with decremting counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range:  $\pm 0.66$  seconds error per month
- Calibrates up to 260 ppm of crystal error
- Requirements: External 32.768 kHz clock crystal
- Alarm pulse or seconds clock output on RTCC pin

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-26 **Unimplemented:** Read as '0'

bit 25-16 **CAL<9:0>:** RTC Drift Calibration bits, which contain a signed 10-bit integer value

0111111111 = Maximum positive adjustment, adds 511 RTC clock pulses every one minute

•  
•  
•

0000000001 = Minimum positive adjustment, adds 1 RTC clock pulse every one minute

0000000000 = No adjustment

1111111111 = Minimum negative adjustment, subtracts 1 RTC clock pulse every one minute

•  
•  
•

1000000000 = Maximum negative adjustment, subtracts 512 clock pulses every one minute

bit 15 **ON:** RTCC On bit<sup>(1,2)</sup>

1 = RTCC module is enabled

0 = RTCC module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Disables the PBCLK to the RTCC when the device enters Idle mode

0 = Continue normal operation when the device enters Idle mode

bit 12-8 **Unimplemented:** Read as '0'

bit 7 **RTSECSEL:** RTCC Seconds Clock Output Select bit<sup>(3)</sup>

1 = RTCC Seconds Clock is selected for the RTCC pin

0 = RTCC Alarm Pulse is selected for the RTCC pin

bit 6 **RTCCLKON:** RTCC Clock Enable Status bit

1 = RTCC Clock is actively running

0 = RTCC Clock is not running

**Note 1:** The ON bit is only writable when RTCWREN = 1.

**2:** When using the 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

**3:** Requires RTCOE = 1 (RTCCON<0>) for the output to be active.

**4:** The RTCWREN bit can be set only when the write sequence is enabled.

**5:** This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

**Note:** This register is reset only on a Power-on Reset (POR).

## REGISTER 21-1: RTCCON: RTC CONTROL REGISTER (CONTINUED)

- bit 5-4 **Unimplemented:** Read as '0'
- bit 3 **RTCWREN:** RTC Value Registers Write Enable bit<sup>(4)</sup>  
1 = RTC Value registers can be written to by the user  
0 = RTC Value registers are locked out from being written to by the user
- bit 2 **RTCSYNC:** RTCC Value Registers Read Synchronization bit  
1 = RTC Value registers can change while reading, due to a rollover ripple that results in an invalid data read  
If the register is read twice and results in the same data, the data can be assumed to be valid  
0 = RTC Value registers can be read without concern about a rollover ripple
- bit 1 **HALFSEC:** Half-Second Status bit<sup>(5)</sup>  
1 = Second half period of a second  
0 = First half period of a second
- bit 0 **RTCOE:** RTCC Output Enable bit  
1 = RTCC clock output enabled – clock presented onto an I/O  
0 = RTCC clock output disabled

- Note 1:** The ON bit is only writable when RTCWREN = 1.
- 2:** When using the 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
- 3:** Requires RTCOE = 1 (RTCCON<0>) for the output to be active.
- 4:** The RTCWREN bit can be set only when the write sequence is enabled.
- 5:** This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

**Note:** This register is reset only on a Power-on Reset (POR).

| 15:8      | R/W-0<br>ALRMEN <sup>(1,2)</sup>  | R/W-0<br>CHIME <sup>(2)</sup> | R/W-0<br>PIV <sup>(2)</sup> | R-0<br>ALRMSYNC <sup>(3)</sup> | R/W-0          | R/W-0          | R/W-0         | R/W-0         |
| 7:0       | R/W-0<br>ARPT<7:0> <sup>(2)</sup> |                               |                             |                                |                |                |               |               |

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
 -n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ALRMEN:** Alarm Enable bit<sup>(1,2)</sup>

- 1 = Alarm is enabled
- 0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit<sup>(2)</sup>

- 1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
- 0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit<sup>(2)</sup>

When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.  
 When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit<sup>(3)</sup>

- 1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read.  
 The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing, which are then synchronized to the PB clock domain
- 0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is > 32 RTC clocks away from a half-second rollover

bit 11-8 **AMASK<3:0>:** Alarm Mask Configuration bits<sup>(2)</sup>

- 0000 = Every half-second
- 0001 = Every second
- 0010 = Every 10 seconds
- 0011 = Every minute
- 0100 = Every 10 minutes
- 0101 = Every hour
- 0110 = Once a day
- 0111 = Once a week
- 1000 = Once a month
- 1001 = Once a year (except when configured for February 29, once every four years)
- 1010 = Reserved; do not use
- 1011 = Reserved; do not use
- 11xx = Reserved; do not use

- Note 1:** Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.
- 2:** This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.
- 3:** This assumes a CPU read will execute in less than 32 PBCLKs.

**Note:** This register is reset only on a Power-on Reset (POR).

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

---

## REGISTER 21-2: RTCALRM: RTC ALARM CONTROL REGISTER (CONTINUED)

bit 7-0 **ARPT<7:0>**: Alarm Repeat Counter Value bits<sup>(2)</sup>

11111111 = Alarm will trigger 256 times

.

.

.

00000000 = Alarm will trigger one time

The counter decrements on any alarm event. The counter only rolls over from 0x00 to 0xFF if CHIME = 1.

- Note 1:** Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.
- 2:** This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.
- 3:** This assumes a CPU read will execute in less than 32 PBCLKs.

**Note:** This register is reset only on a Power-on Reset (POR).

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 22.0 10-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 17. “10-bit Analog-to-Digital Converter (ADC)”** (DS60001104), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

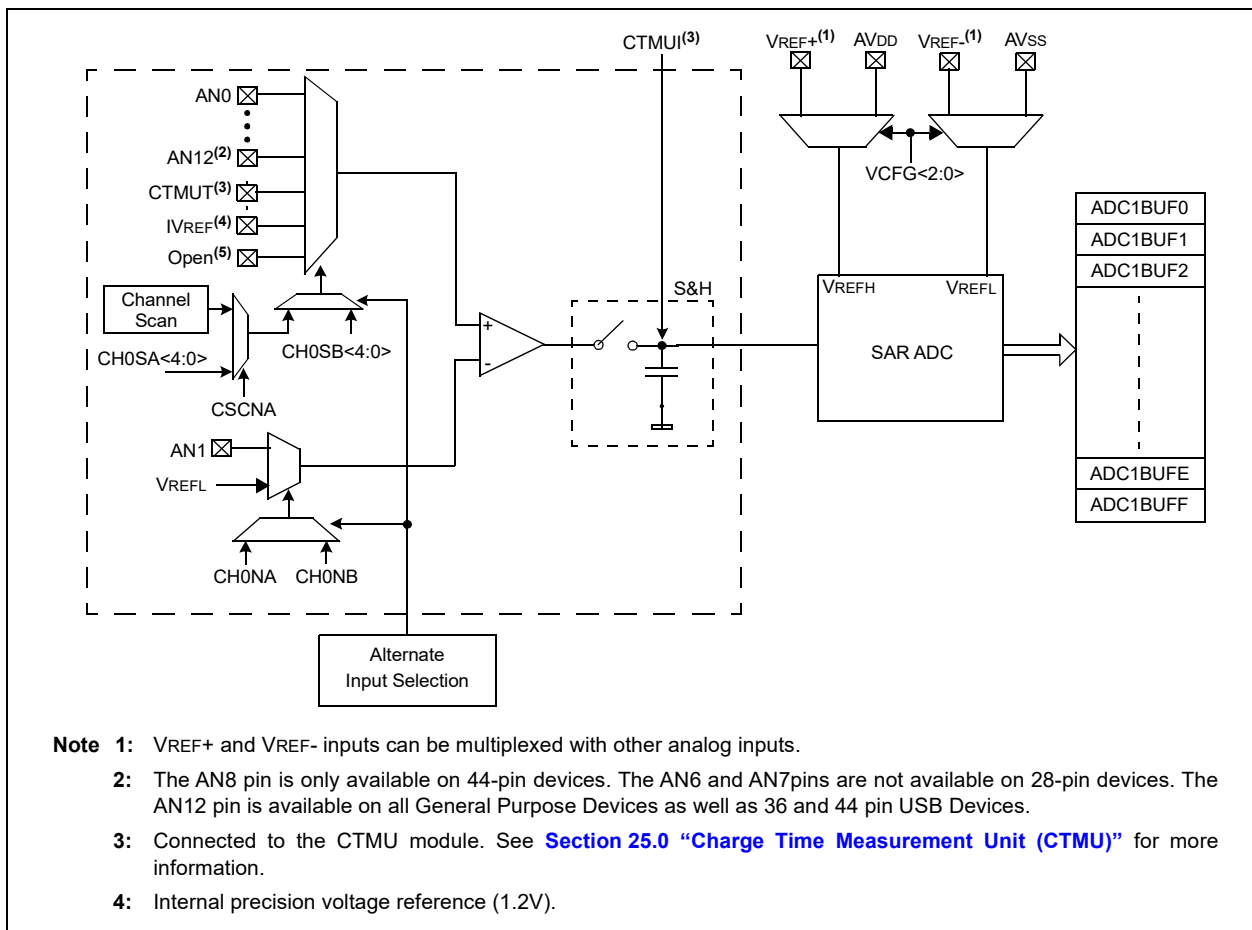

The 10-bit Analog-to-Digital Converter (ADC) includes the following features:

- Successive Approximation Register (SAR) conversion
- Up to 1 Msps conversion speed

- Up to 13 analog input pins
- External voltage reference input pins
- One unipolar, differential Sample and Hold Amplifier (SHA)
- Automatic Channel Scan mode
- Selectable conversion trigger source
- 16-word conversion result buffer
- Selectable buffer fill modes
- Eight conversion result format options
- Operation during Sleep and Idle modes

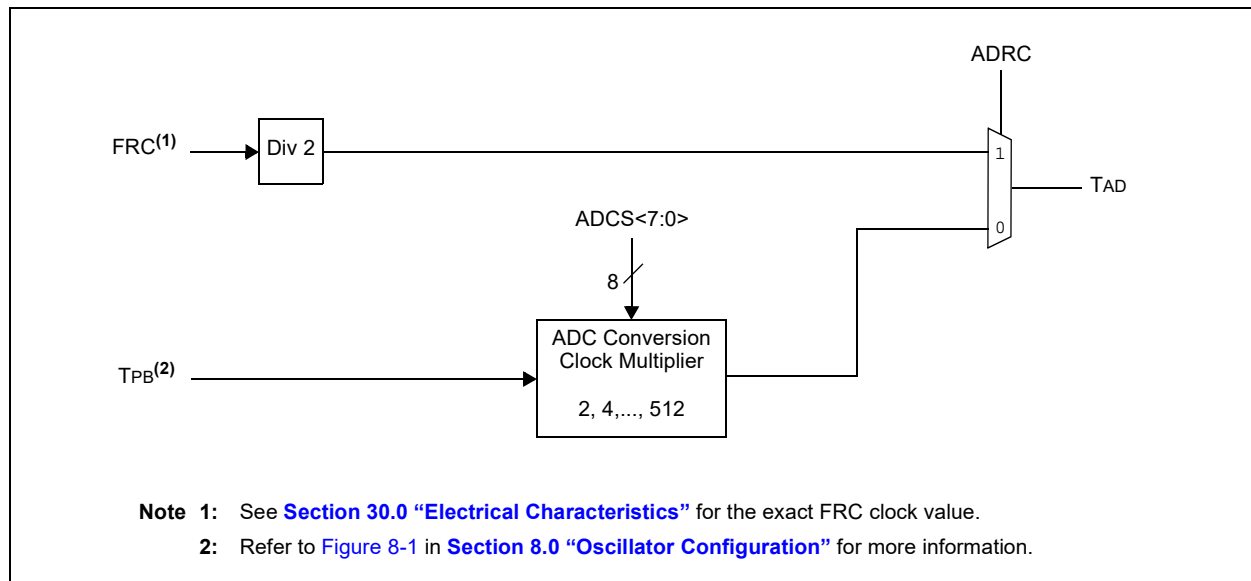

A block diagram of the 10-bit ADC is illustrated in [Figure 22-1](#). [Figure 22-2](#) illustrates a block diagram of the ADC conversion clock period. The 10-bit ADC has up to 13 analog input pins, designated AN0-AN12. In addition, there are two analog input pins for external voltage reference connections. These voltage reference inputs may be shared with other analog input pins and may be common to other analog module references.

|                   |                  |                                    |
|-------------------|------------------|------------------------------------|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared               |
|                   |                  | x = Bit is unknown                 |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** ADC Operating Mode bit<sup>(1)</sup>

- 1 = ADC module is operating
- 0 = ADC module is not operating

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

- 1 = Discontinue module operation when device enters Idle mode
- 0 = Continue module operation when the device enters Idle mode

bit 12-11 **Unimplemented:** Read as '0'

bit 10-8 **FORM<2:0>:** Data Output Format bits

- 111 = Signed Fractional 32-bit (DOUT = sddd dddd dd00 0000 0000 0000 0000)
- 110 = Fractional 32-bit (DOUT = dddd dddd dd00 0000 0000 0000 0000 0000)
- 101 = Signed Integer 32-bit (DOUT = ssss ssss ssss ssss ssss sssd dddd dddd)
- 100 = Integer 32-bit (DOUT = 0000 0000 0000 0000 0000 00dd dddd dddd)
- 011 = Signed Fractional 16-bit (DOUT = 0000 0000 0000 0000 sddd dddd dd00 0000)
- 010 = Fractional 16-bit (DOUT = 0000 0000 0000 0000 dddd dddd dd00 0000)
- 001 = Signed Integer 16-bit (DOUT = 0000 0000 0000 0000 ssss sssd dddd dddd)
- 000 = Integer 16-bit (DOUT = 0000 0000 0000 0000 00dd dddd dddd)

bit 7-5 **SSRC<2:0>:** Conversion Trigger Source Select bits

- 111 = Internal counter ends sampling and starts conversion (auto convert)
- 110 = Reserved
- 101 = Reserved
- 100 = Reserved
- 011 = CTMU ends sampling and starts conversion
- 010 = Timer 3 period match ends sampling and starts conversion
- 001 = Active transition on INT0 pin ends sampling and starts conversion
- 000 = Clearing SAMP bit ends sampling and starts conversion

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

**2:** If ASAM = 0, software can write a '1' to start sampling. This bit is automatically set by hardware if ASAM = 1. If SSRC = 0, software can write a '0' to end sampling and start conversion. If SSRC ≠ '0', this bit is automatically cleared by hardware to end sampling and start conversion.

**3:** This bit is automatically set by hardware when analog-to-digital conversion is complete. Software can write a '0' to clear this bit (a write of '1' is not allowed). Clearing this bit does not affect any operation already in progress. This bit is automatically cleared by hardware at the start of a new conversion.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## REGISTER 22-1: AD1CON1: ADC CONTROL REGISTER 1 (CONTINUED)

- bit 4 **CLRASAM:** Stop Conversion Sequence bit (when the first ADC interrupt is generated)  
1 = Stop conversions when the first ADC interrupt is generated. Hardware clears the ASAM bit when the ADC interrupt is generated.  
0 = Normal operation, buffer contents will be overwritten by the next conversion sequence
- bit 3 **Unimplemented:** Read as '0'
- bit 2 **ASAM:** ADC Sample Auto-Start bit  
1 = Sampling begins immediately after last conversion completes; SAMP bit is automatically set.  
0 = Sampling begins when SAMP bit is set
- bit 1 **SAMP:** ADC Sample Enable bit<sup>(2)</sup>  
1 = The ADC sample and hold amplifier is sampling  
0 = The ADC sample/hold amplifier is holding  
When ASAM = 0, writing '1' to this bit starts sampling.  
When SSRC = 000, writing '0' to this bit will end sampling and start conversion.
- bit 0 **DONE:** Analog-to-Digital Conversion Status bit<sup>(3)</sup>  
1 = Analog-to-digital conversion is done  
0 = Analog-to-digital conversion is not done or has not started  
Clearing this bit will not affect any operation in progress.

- Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
- 2:** If ASAM = 0, software can write a '1' to start sampling. This bit is automatically set by hardware if ASAM = 1. If SSRC = 0, software can write a '0' to end sampling and start conversion. If SSRC ≠ '0', this bit is automatically cleared by hardware to end sampling and start conversion.
- 3:** This bit is automatically set by hardware when analog-to-digital conversion is complete. Software can write a '0' to clear this bit (a write of '1' is not allowed). Clearing this bit does not affect any operation already in progress. This bit is automatically cleared by hardware at the start of a new conversion.

bit 12 **OFFCAL:** Input Offset Calibration Mode Select bit

- 1 = Enable Offset Calibration mode  
Positive and negative inputs of the sample and hold amplifier are connected to VREFL
- 0 = Disable Offset Calibration mode  
The inputs to the sample and hold amplifier are controlled by AD1CHS or AD1CSSL

bit 11 **Unimplemented:** Read as '0'

bit 10 **CSCNA:** Input Scan Select bit

- 1 = Scan inputs
- 0 = Do not scan inputs

bit 9-8 **Unimplemented:** Read as '0'

bit 7 **BUFS:** Buffer Fill Status bit

- Only valid when BUFM = 1.
- 1 = ADC is currently filling buffer 0x8-0xF, user should access data in 0x0-0x7
- 0 = ADC is currently filling buffer 0x0-0x7, user should access data in 0x8-0xF

bit 6 **Unimplemented:** Read as '0'

bit 5-2 **SMPI<3:0>**: Sample/Convert Sequences Per Interrupt Selection bits

- 1111 = Interrupts at the completion of conversion for each 16<sup>th</sup> sample/convert sequence
- 1110 = Interrupts at the completion of conversion for each 15<sup>th</sup> sample/convert sequence
- .
- .
- 0001 = Interrupts at the completion of conversion for each 2<sup>nd</sup> sample/convert sequence
- 0000 = Interrupts at the completion of conversion for each sample/convert sequence

bit 1 **BUFM:** ADC Result Buffer Mode Select bit

- 1 = Buffer configured as two 8-word buffers, ADC1BUF7-ADC1BUF0, ADC1BUFF-ADCBUF8
- 0 = Buffer configured as one 16-word buffer ADC1BUFF-ADC1BUF0

bit 0 **ALTS:** Alternate Input Sample Mode Select bit

- 1 = Uses Sample A input multiplexer settings for first sample, then alternates between Sample B and Sample A input multiplexer settings for all subsequent samples
- 0 = Always use Sample A input multiplexer settings

**2:** On devices with less than 13 analog inputs, all CSSLx bits can be selected; however, inputs selected for scan without a corresponding input on the device will convert to VREFL.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 23.0 COMPARATOR

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. “Comparator”** (DS60001110), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

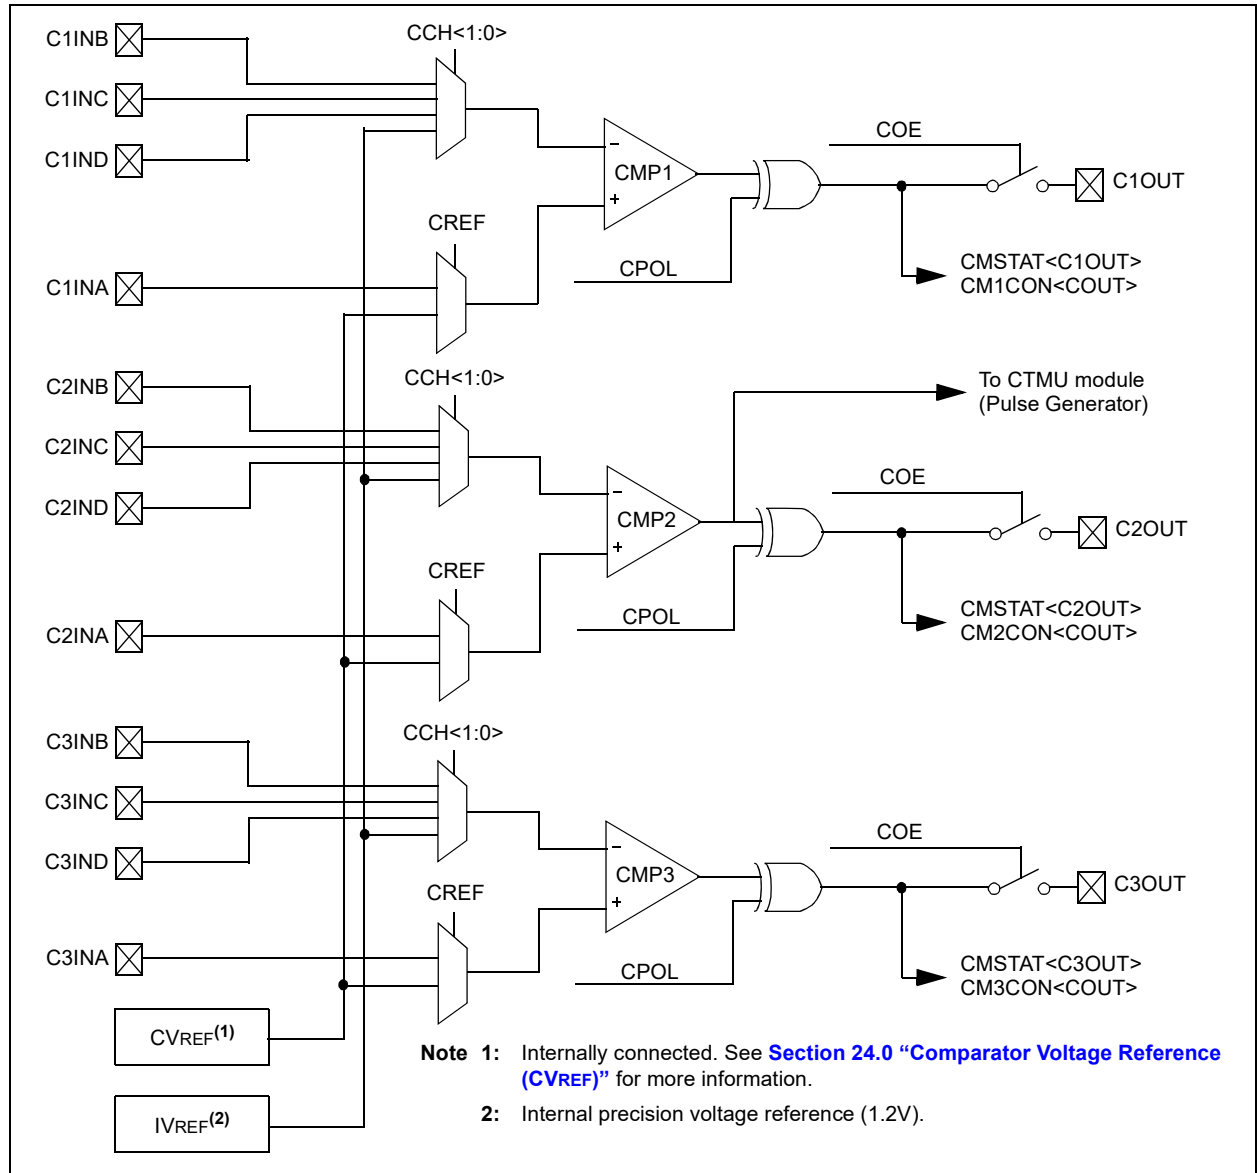

Following are some of the key features of this module:

- Selectable inputs available include:
  - Analog inputs multiplexed with I/O pins
  - On-chip internal absolute voltage reference (IVREF)
  - Comparator voltage reference (CVREF)
- Outputs can be Inverted
- Selectable interrupt generation

A block diagram of the comparator module is provided in [Figure 23-1](#).

The Analog Comparator module contains three comparators that can be configured in a variety of ways.

**Legend:**

|                   |                  |  |
|-------------------|------------------|--|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared      x = Bit is unknown |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Comparator ON bit<sup>(1)</sup>

1 = Module is enabled. Setting this bit does not affect the other bits in this register

0 = Module is disabled and does not consume current. Clearing this bit does not affect the other bits in this register

bit 14 **COE:** Comparator Output Enable bit

1 = Comparator output is driven on the output CxOUT pin

0 = Comparator output is not driven on the output CxOUT pin

bit 13 **CPOL:** Comparator Output Inversion bit<sup>(2)</sup>

1 = Output is inverted

0 = Output is not inverted

bit 12-9 **Unimplemented:** Read as '0'

bit 8 **COUT:** Comparator Output bit

1 = Output of the Comparator is a '1'

0 = Output of the Comparator is a '0'

bit 7-6 **EVPOL<1:0>:** Interrupt Event Polarity Select bits

11 = Comparator interrupt is generated on a low-to-high or high-to-low transition of the comparator output

10 = Comparator interrupt is generated on a high-to-low transition of the comparator output

01 = Comparator interrupt is generated on a low-to-high transition of the comparator output

00 = Comparator interrupt generation is disabled

bit 5 **Unimplemented:** Read as '0'

bit 4 **CREF:** Comparator Positive Input Configure bit

1 = Comparator non-inverting input is connected to the internal CVREF

0 = Comparator non-inverting input is connected to the CxINA pin

bit 3-2 **Unimplemented:** Read as '0'

bit 1-0 **CCH<1:0>:** Comparator Negative Input Select bits for Comparator

11 = Comparator inverting input is connected to the IVREF

10 = Comparator inverting input is connected to the CxIND pin

01 = Comparator inverting input is connected to the CxINC pin

00 = Comparator inverting input is connected to the CxINB pin

**Note 1:** When using the 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

**2:** Setting this bit will invert the signal to the comparator interrupt generator as well. This will result in an interrupt being generated on the opposite edge from the one selected by EVPOL<1:0>.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 24.0 COMPARATOR VOLTAGE REFERENCE (CVREF)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 20. “Comparator Voltage Reference (CVREF)”** (DS60001109), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

The CVREF module is a 16-tap, resistor ladder network that provides a selectable reference voltage. Although its primary purpose is to provide a reference for the analog comparators, it also may be used independently of them.

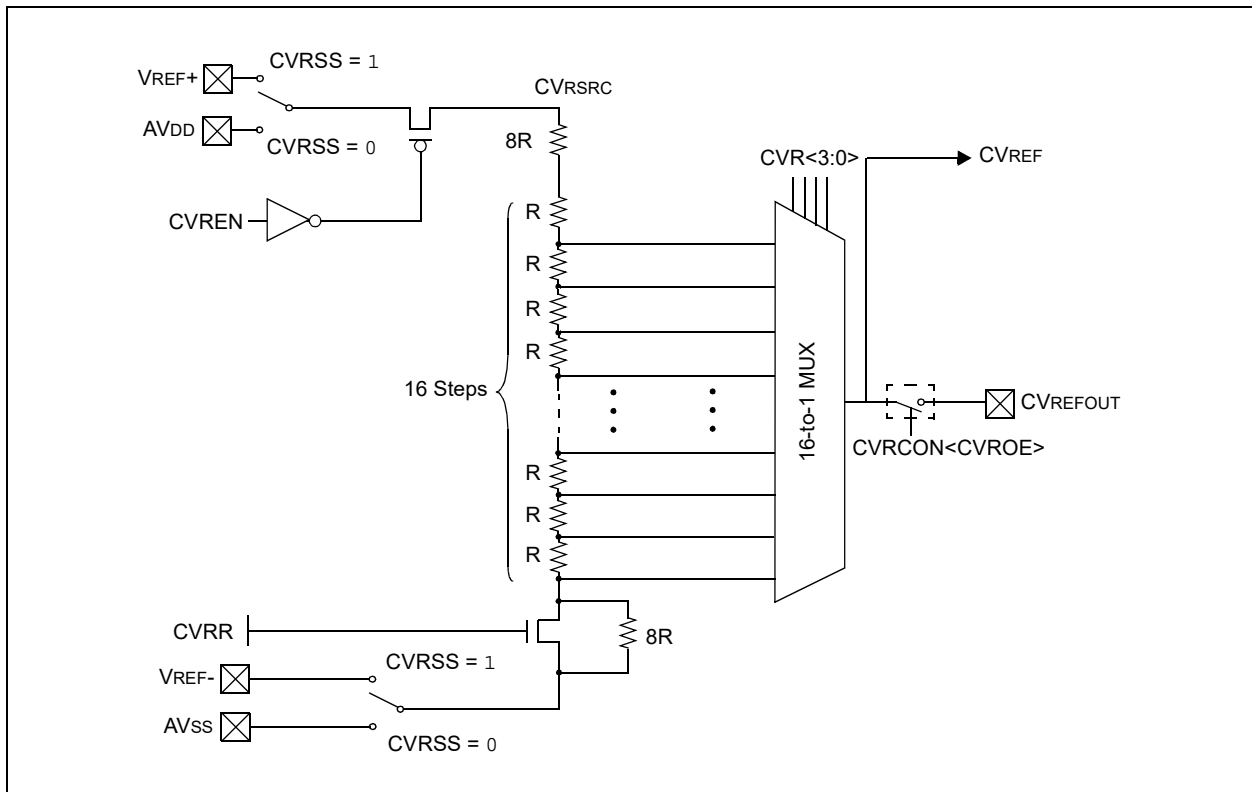

The resistor ladder is segmented to provide two ranges of voltage reference values and has a power-down function to conserve power when the reference is not being used. The module's supply reference can be provided from either device VDD/VSS or an external voltage reference. The CVREF output is available for the comparators and typically available for pin output.

The comparator voltage reference has the following features:

- High and low range selection
- Sixteen output levels available for each range
- Internally connected to comparators to conserve device pins
- Output can be connected to a pin

A block diagram of the module is shown in [Figure 24-1](#).

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
-n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Comparator Voltage Reference On bit<sup>(1)</sup>

1 = Module is enabled

Setting this bit does not affect other bits in the register.

0 = Module is disabled and does not consume current.

Clearing this bit does not affect the other bits in the register.

bit 14-7 **Unimplemented:** Read as '0'

bit 6 **CVROE:** CVREFOUT Enable bit

1 = Voltage level is output on CVREFOUT pin

0 = Voltage level is disconnected from CVREFOUT pin

bit 5 **CVRR:** CVREF Range Selection bit

1 = 0 to 0.67 CVRSRC, with CVRSRC/24 step size

0 = 0.25 CVRSRC to 0.75 CVRSRC, with CVRSRC/32 step size

bit 4 **CVRSS:** CVREF Source Selection bit

1 = Comparator voltage reference source, CVRSRC = (VREF+) – (VREF-)

0 = Comparator voltage reference source, CVRSRC = AVDD – AVSS

bit 3-0 **CVR<3:0>:** CVREF Value Selection  $0 \leq \text{CVR}<3:0> \leq 15$  bits

When CVRR = 1:

$$\text{CVREF} = (\text{CVR}<3:0>/24) \cdot (\text{CVRSRC})$$

When CVRR = 0:

$$\text{CVREF} = 1/4 \cdot (\text{CVRSRC}) + (\text{CVR}<3:0>/32) \cdot (\text{CVRSRC})$$

**Note 1:** When using 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

NOTES:

## 25.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 37. “Charge Time Measurement Unit (CTMU)”** (DS60001167), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

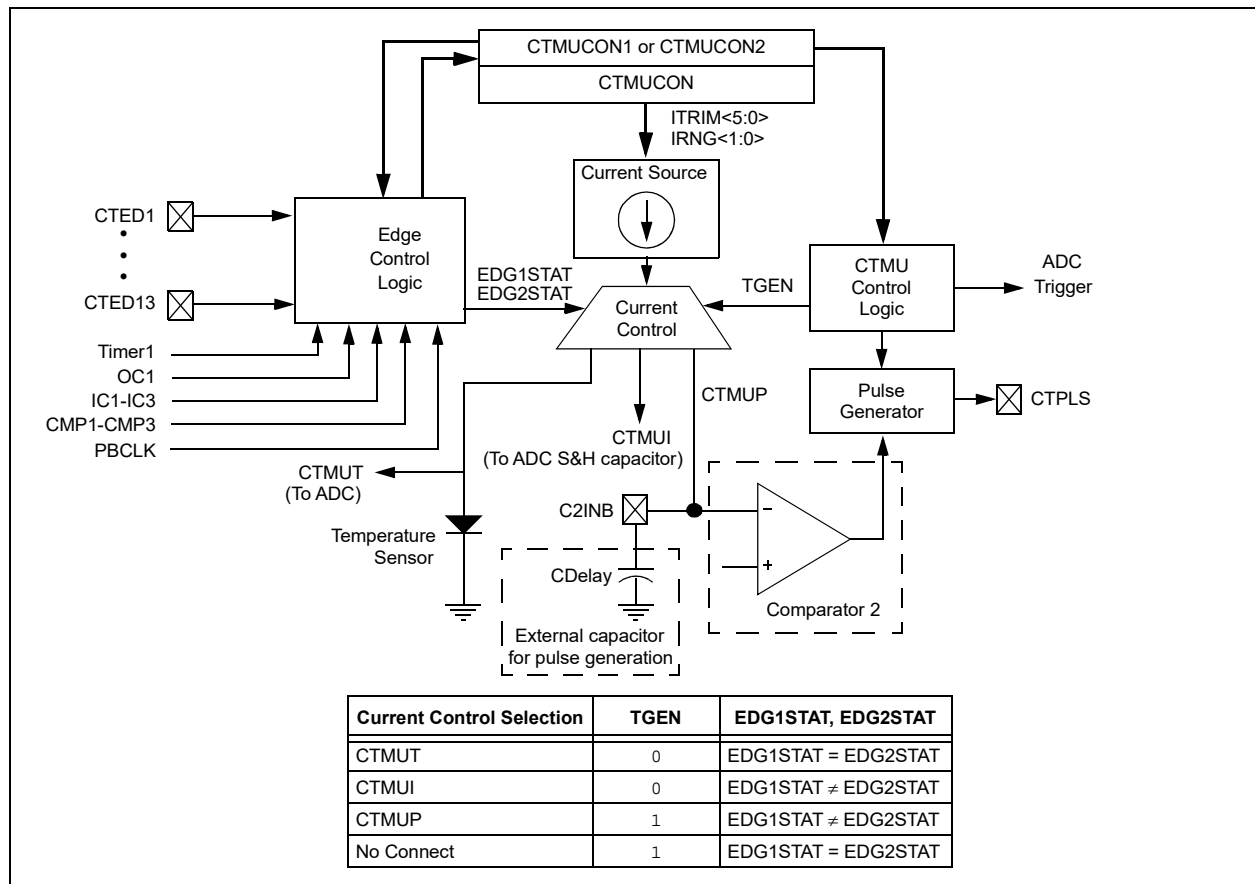

The Charge Time Measurement Unit (CTMU) is a flexible analog module that has a configurable current source with a digital configuration circuit built around it. The CTMU can be used for differential time measurement between pulse sources and can be used for generating an asynchronous pulse. By working with other on-chip analog modules, the CTMU can be used for high resolution time measurement, measure capacitance, measure relative changes in capacitance or generate output pulses with a specific time delay. The CTMU is ideal for interfacing with capacitive-based sensors.

The CTMU module includes the following key features:

- Up to 13 channels available for capacitive or time measurement input
- On-chip precision current source
- 16-edge input trigger sources
- Selection of edge or level-sensitive inputs
- Polarity control for each edge source
- Control of edge sequence
- Control of response to edges
- High precision time measurement
- Time delay of external or internal signal asynchronous to system clock
- Integrated temperature sensing diode
- Control of current source during auto-sampling
- Four current source ranges
- Time measurement resolution of one nanosecond

A block diagram of the CTMU is shown in [Figure 25-1](#).

**FIGURE 25-1: CTMU BLOCK DIAGRAM**

### Legend:

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
-n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

bit 31 **EDG1MOD:** Edge1 Edge Sampling Select bit

1 = Input is edge-sensitive  
0 = Input is level-sensitive

bit 30 **EDG1POL:** Edge 1 Polarity Select bit

1 = Edge1 programmed for a positive edge response  
0 = Edge1 programmed for a negative edge response

bit 29-26 **EDG1SEL<3:0>:** Edge 1 Source Select bits

1111 = C3OUT pin is selected  
1110 = C2OUT pin is selected  
1101 = C1OUT pin is selected  
1100 = IC3 Capture Event is selected  
1011 = IC2 Capture Event is selected  
1010 = IC1 Capture Event is selected  
1001 = CTED8 pin is selected  
1000 = CTED7 pin is selected  
0111 = CTED6 pin is selected  
0110 = CTED5 pin is selected  
0101 = CTED4 pin is selected  
0100 = CTED3 pin is selected  
0011 = CTED1 pin is selected  
0010 = CTED2 pin is selected  
0001 = OC1 Compare Event is selected  
0000 = Timer1 Event is selected

bit 25 **EDG2STAT:** Edge2 Status bit

Indicates the status of Edge2 and can be written to control edge source  
1 = Edge2 has occurred  
0 = Edge2 has not occurred

**Note 1:** When this bit is set for Pulse Delay Generation, the EDG2SEL<3:0> bits must be set to '1110' to select C2OUT.

**2:** The ADC module Sample and Hold capacitor is not automatically discharged between sample/conversion cycles. Software using the ADC as part of a capacitive measurement, must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC module must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.

**3:** Refer to the CTMU Current Source Specifications (Table 30-41) in Section 30.0 "Electrical Characteristics" for current values.

**4:** This bit setting is not available for the CTMU temperature diode.

NOTES:

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 26.0 POWER-SAVING FEATURES

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. “Power-Saving Features”** (DS60001130), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

This section describes power-saving features for the PIC32MX1XX/2XX 28/36/44-pin Family. The PIC32 devices offer a total of nine methods and modes, organized into two categories, that allow the user to balance power consumption with device performance. In all of the methods and modes described in this section, power-saving is controlled by software.

### 26.1 Power Saving with CPU Running

When the CPU is running, power consumption can be controlled by reducing the CPU clock frequency, lowering the PBCLK and by individually disabling modules. These methods are grouped into the following categories:

- FRC Run mode: the CPU is clocked from the FRC clock source with or without postscalers
- LPRC Run mode: the CPU is clocked from the LPRC clock source
- Sosc Run mode: the CPU is clocked from the Sosc clock source

In addition, the Peripheral Bus Scaling mode is available where peripherals are clocked at the programmable fraction of the CPU clock (SYSCLK).

### 26.2 CPU Halted Methods

The device supports two power-saving modes, Sleep and Idle, both of which Halt the clock to the CPU. These modes operate with all clock sources, as follows:

- Posc Idle mode: the system clock is derived from the Posc. The system clock source continues to operate. Peripherals continue to operate, but can optionally be individually disabled.
- FRC Idle mode: the system clock is derived from the FRC with or without postscalers. Peripherals continue to operate, but can optionally be individually disabled.
- Sosc Idle mode: the system clock is derived from the Sosc. Peripherals continue to operate, but can optionally be individually disabled.

- LPRC Idle mode: the system clock is derived from the LPRC. Peripherals continue to operate, but can optionally be individually disabled. This is the lowest power mode for the device with a clock running.
- Sleep mode: the CPU, the system clock source and any peripherals that operate from the system clock source are Halted. Some peripherals can operate in Sleep using specific clock sources. This is the lowest power mode for the device.

## 26.3 Power-Saving Operation

Peripherals and the CPU can be Halted or disabled to further reduce power consumption.

### 26.3.1 SLEEP MODE

Sleep mode has the lowest power consumption of the device power-saving operating modes. The CPU and most peripherals are Halted. Select peripherals can continue to operate in Sleep mode and can be used to wake the device from Sleep. See the individual peripheral module sections for descriptions of behavior in Sleep.

Sleep mode includes the following characteristics:

- The CPU is halted
- The system clock source is typically shutdown. See **Section 26.3.3 “Peripheral Bus Scaling Method”** for specific information.
- There can be a wake-up delay based on the oscillator selection
- The Fail-Safe Clock Monitor (FSCM) does not operate during Sleep mode
- The BOR circuit remains operative during Sleep mode
- The WDT, if enabled, is not automatically cleared prior to entering Sleep mode
- Some peripherals can continue to operate at limited functionality in Sleep mode. These peripherals include I/O pins that detect a change in the input signal, WDT, ADC, UART and peripherals that use an external clock input or the internal LPRC oscillator (e.g., RTCC, Timer1 and Input Capture).
- I/O pins continue to sink or source current in the same manner as they do when the device is not in Sleep
- The USB module can override the disabling of the Posc or FRC. Refer to the USB section for specific details.
- Modules can be individually disabled by software prior to entering Sleep in order to further reduce consumption

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

The processor will exit, or 'wake-up', from Sleep on one of the following events:

- On any interrupt from an enabled source that is operating in Sleep. The interrupt priority must be greater than the current CPU priority.
- On any form of device Reset
- On a WDT time-out

If the interrupt priority is lower than or equal to the current priority, the CPU will remain Halted, but the PBCLK will start running and the device will enter into Idle mode.

## 26.3.2 IDLE MODE

In Idle mode, the CPU is Halted but the System Clock (SYSCLK) source is still enabled. This allows peripherals to continue operation when the CPU is Halted. Peripherals can be individually configured to Halt when entering Idle by setting their respective SIDL bit. Latency, when exiting Idle mode, is very low due to the CPU oscillator source remaining active.

**Note 1:** Changing the PBCLK divider ratio requires recalculation of peripheral timing. For example, assume the UART is configured for 9600 baud with a PB clock ratio of 1:1 and a Posc of 8 MHz. When the PB clock divisor of 1:2 is used, the input frequency to the baud clock is cut in half; therefore, the baud rate is reduced to 1/2 its former value. Due to numeric truncation in calculations (such as the baud rate divisor), the actual baud rate may be a tiny percentage different than expected. For this reason, any timing calculation required for a peripheral should be performed with the new PB clock frequency instead of scaling the previous value based on a change in the PB divisor ratio.

- 2:** Oscillator start-up and PLL lock delays are applied when switching to a clock source that was disabled and that uses a crystal and/or the PLL. For example, assume the clock source is switched from Posc to LPRC just prior to entering Sleep in order to save power. No oscillator start-up delay would be applied when exiting Idle. However, when switching back to Posc, the appropriate PLL and/or oscillator start-up/lock delays would be applied.

The device enters Idle mode when the SLPEN (OSCCON<4>) bit is clear and a WAIT instruction is executed.

The processor will wake or exit from Idle mode on the following events:

- On any interrupt event for which the interrupt source is enabled. The priority of the interrupt event must be greater than the current priority of the CPU. If the priority of the interrupt event is lower than or equal to current priority of the CPU, the CPU will remain Halted and the device will remain in Idle mode.
- On any form of device Reset
- On a WDT time-out interrupt

## 26.3.3 PERIPHERAL BUS SCALING METHOD

Most of the peripherals on the device are clocked using the PBCLK. The Peripheral Bus can be scaled relative to the SYSCLK to minimize the dynamic power consumed by the peripherals. The PBCLK divisor is controlled by PBDIV<1:0> (OSCCON<20:19>), allowing SYSCLK to PBCLK ratios of 1:1, 1:2, 1:4 and 1:8. All peripherals using PBCLK are affected when the divisor is changed. Peripherals such as the USB, Interrupt Controller, DMA, and the bus matrix are clocked directly from SYSCLK. As a result, they are not affected by PBCLK divisor changes.

Changing the PBCLK divisor affects:

- The CPU to peripheral access latency. The CPU has to wait for next PBCLK edge for a read to complete. In 1:8 mode, this results in a latency of one to seven SYSCLKs.
- The power consumption of the peripherals. Power consumption is directly proportional to the frequency at which the peripherals are clocked. The greater the divisor, the lower the power consumed by the peripherals.

To minimize dynamic power, the PB divisor should be chosen to run the peripherals at the lowest frequency that provides acceptable system performance. When selecting a PBCLK divider, peripheral clock requirements, such as baud rate accuracy, should be taken into account. For example, the UART peripheral may not be able to achieve all baud rate values at some PBCLK divider depending on the SYSCLK value.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 26.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

To disable a peripheral, the associated PMDx bit must be set to '1'. To enable a peripheral, the associated PMDx bit must be cleared (default). See [Table 26-1](#) for more information.

**Note:** Disabling a peripheral module while it's ON bit is set, may result in undefined behavior. The ON bit for the associated peripheral module must be cleared prior to disable a module via the PMDx bits.

**TABLE 26-1: PERIPHERAL MODULE DISABLE BITS AND LOCATIONS**

| Peripheral <sup>(1)</sup>    | PMDx bit Name <sup>(1)</sup> | Register Name and Bit Location |
|------------------------------|------------------------------|--------------------------------|
| ADC1                         | AD1MD                        | PMD1<0>                        |

## 26.4.1 CONTROLLING CONFIGURATION CHANGES

Because peripherals can be disabled during run time, some restrictions on disabling peripherals are needed to prevent accidental configuration changes. PIC32 devices include two features to prevent alterations to enabled or disabled peripherals:

- Control register lock sequence
- Configuration bit select lock

### 26.4.1.1 Control Register Lock

Under normal operation, writes to the PMDx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the Configuration bit, PMDLOCK (CFGCON<12>). Setting PMDLOCK prevents writes to the control registers; clearing PMDLOCK allows writes.

To set or clear PMDLOCK, an unlock sequence must be executed. Refer to **Section 6. “Oscillator”** (DS60001112) in the *“PIC32 Family Reference Manual”* for details.

### 26.4.1.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the PMDx registers. The Configuration bit, PMDL1WAY (DEVCFG3<28>), blocks the PMDLOCK bit from being cleared after it has been set once. If PMDLOCK remains set, the register unlock procedure does not execute, and the peripheral pin select control registers cannot be written to. The only way to clear the bit and re-enable PMD functionality is to perform a device Reset.

## 27.0 SPECIAL FEATURES

**Note:** This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 32. “Configuration”** (DS60001124) and **Section 33. “Programming and Diagnostics”** (DS60001129), which are available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site ([www.microchip.com/pic32](http://www.microchip.com/pic32)).

PIC32MX1XX/2XX 28/36/44-pin Family devices include the following features intended to maximize application flexibility, reliability and minimize cost through elimination of external components.

- Flexible device configuration
- Joint Test Action Group (JTAG) interface
- In-Circuit Serial Programming™ (ICSP™)

## 27.1 Configuration Bits

The Configuration bits can be programmed using the following registers to select various device configurations.

- [DEVCFG0: Device Configuration Word 0](#)
- [DEVCFG1: Device Configuration Word 1](#)
- [DEVCFG2: Device Configuration Word 2](#)
- [DEVCFG3: Device Configuration Word 3](#)
- [CFGCON: Configuration Control Register](#)

In addition, the DEVID register ([Register 27-6](#)) provides device and revision information.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 27.3 On-Chip Voltage Regulator

All PIC32MX1XX/2XX 28/36/44-pin Family devices' core and digital logic are designed to operate at a nominal 1.8V. To simplify system designs, most devices in the PIC32MX1XX/2XX 28/36/44-pin Family family incorporate an on-chip regulator providing the required core logic voltage from VDD.

A low-ESR capacitor (such as tantalum) must be connected to the VCAP pin (see Figure 27-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Section 30.1 "DC Characteristics".

**Note:** It is important that the low-ESR capacitor is placed as close as possible to the VCAP pin.

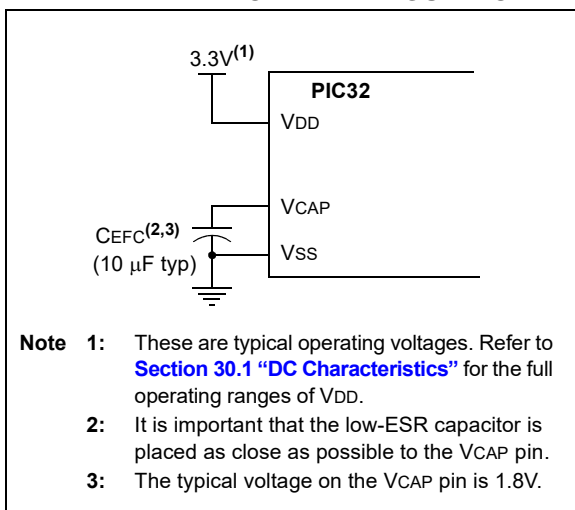

### 27.3.1 ON-CHIP REGULATOR AND POR

It takes a fixed delay for the on-chip regulator to generate an output. During this time, designated as TPU, code execution is disabled. TPU is applied every time the device resumes operation after any power-down, including Sleep mode.

### 27.3.2 ON-CHIP REGULATOR AND BOR

PIC32MX1XX/2XX 28/36/44-pin Family devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<1>). The brown-out voltage levels are specific in Section 30.1 "DC Characteristics".

**FIGURE 27-1: CONNECTIONS FOR THE ON-CHIP REGULATOR**

## 27.4 Programming and Diagnostics

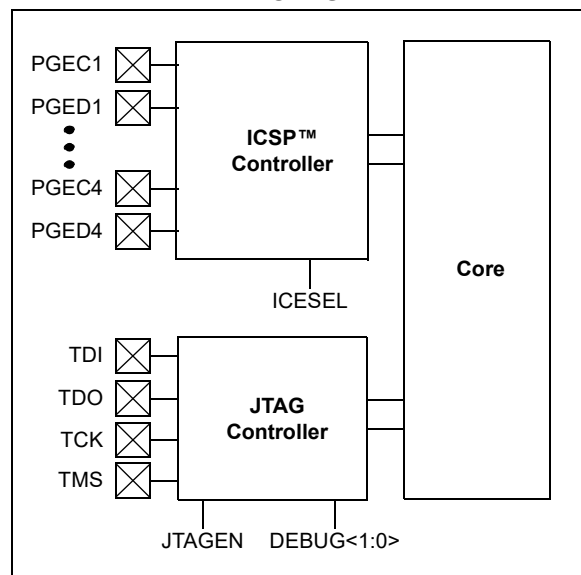

PIC32MX1XX/2XX 28/36/44-pin Family devices provide a complete range of programming and diagnostic features that can increase the flexibility of any application using them. These features allow system designers to include:

- Simplified field programmability using two-wire In-Circuit Serial Programming™ (ICSP™) interfaces
- Debugging using ICSP
- Programming and debugging capabilities using the EJTAG extension of JTAG
- JTAG boundary scan testing for device and board diagnostics

PIC32 devices incorporate two programming and diagnostic modules, and a trace controller, that provide a range of functions to the application developer.

Figure 27-2 illustrates a block diagram of the programming, debugging, and trace ports.

**FIGURE 27-2: BLOCK DIAGRAM OF PROGRAMMING, DEBUGGING AND TRACE PORTS**

## 28.0 INSTRUCTION SET

The PIC32MX1XX/2XX family instruction set complies with the MIPS32® Release 2 instruction set architecture. The PIC32 device family does not support the following features:

- Core extend instructions
- Coprocessor 1 instructions
- Coprocessor 2 instructions

**Note:** Refer to “MIPS32® Architecture for Programmers Volume II: The MIPS32® Instruction Set” at [www.imgtec.com](http://www.imgtec.com) for more information.

## 29.0 DEVELOPMENT SUPPORT

The PIC<sup>®</sup> microcontrollers (MCU) and dsPIC<sup>®</sup> digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
  - MPLAB<sup>®</sup> X IDE Software
- Compilers/Assemblers/Linkers
  - MPLAB XC Compiler
  - MPASM<sup>™</sup> Assembler
  - MPLINK<sup>™</sup> Object Linker/  
MPLIB<sup>™</sup> Object Librarian
  - MPLAB Assembler/Linker/Librarian for  
Various Device Families
- Simulators
  - MPLAB X SIM Software Simulator
- Emulators
  - MPLAB REAL ICE<sup>™</sup> In-Circuit Emulator
- In-Circuit Debuggers/Programmers
  - MPLAB ICD 3
  - PICKit<sup>™</sup> 3
- Device Programmers
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards,  
Evaluation Kits and Starter Kits
- Third-party development tools

## 29.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows<sup>®</sup>, Linux and Mac OS<sup>®</sup> X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## 29.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

## 29.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

## 29.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/librarian features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

## 29.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

---

## 29.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

## 29.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

## 29.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

## 29.9 PICkit 3 In-Circuit Debugger/Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

## 29.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

## 29.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page ([www.microchip.com](http://www.microchip.com)) for the complete list of demonstration, development and evaluation kits.

## 29.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 30.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MX1XX/2XX 28/36/44-pin Family electrical characteristics for devices that operate at 40 MHz. Refer to [Section 31.0 “50 MHz Electrical Characteristics”](#) for additional specifications for operations at higher frequency. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC32MX1XX/2XX 28/36/44-pin Family devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings

(See Note 1)

|   |                           |
|---|---------------------------|
| Ambient temperature under bias .....  | -40°C to +105°C           |
| Storage temperature .....   | -65°C to +150°C           |
| Voltage on VDD with respect to VSS .....  | -0.3V to +4.0V            |
| Voltage on any pin that is not 5V tolerant, with respect to VSS ( <b>Note 3</b> ).....    | -0.3V to (VDD + 0.3V)     |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 2.3V ( <b>Note 3</b> )..... | -0.3V to +5.5V            |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 2.3V ( <b>Note 3</b> )..... | -0.3V to +3.6V            |
| Voltage on D+ or D- pin with respect to VUSB3V3 .....                                     | -0.3V to (VUSB3V3 + 0.3V) |
| Voltage on VBUS with respect to VSS .....   | -0.3V to +5.5V            |
| Maximum current out of VSS pin(s) .....   | 300 mA                    |
| Maximum current into VDD pin(s) ( <b>Note 2</b> ).....                                    | 300 mA                    |
| Maximum output current sunk by any I/O pin.....   | 15 mA                     |
| Maximum output current sourced by any I/O pin .....                                       | 15 mA                     |
| Maximum current sunk by all ports .....   | 200 mA                    |
| Maximum current sourced by all ports ( <b>Note 2</b> ).....                               | 200 mA                    |

- Note 1:** Stresses above those listed under “**Absolute Maximum Ratings**” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
- 2:** Maximum allowable current is a function of device maximum power dissipation (see [Table 30-2](#)).
- 3:** See the “[Pin Diagrams](#)” section for the 5V tolerant pins.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 30.1 DC Characteristics

**TABLE 30-1: OPERATING MIPS VS. VOLTAGE**

| Characteristic | VDD Range<br>(in Volts) <sup>(1)</sup> | Temp. Range<br>(in °C) | Max. Frequency                     |
|----------------|--|------------------------|------------------------------------|
|                |  |                        | PIC32MX1XX/2XX 28/36/44-pin Family |
| DC5            | 2.3-3.6V                               | -40°C to +85°C         | 40 MHz                             |
| DC5b           | 2.3-3.6V                               | -40°C to +105°C        | 40 MHz                             |

**Note 1:** Overall functional device operation at  $V_{BORMIN} < V_{DD} < V_{DDMIN}$  is tested, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below  $V_{DDMIN}$ . Refer to parameter BO10 in [Table 30-11](#) for BOR values.

**TABLE 30-2: THERMAL OPERATING CONDITIONS**

| Rating   | Symbol | Min.                        | Typical | Max. | Unit |
|--|--------|-----------------------------|---------|------|------|
| <b>Industrial Temperature Devices</b>  |        |                             |         |      |      |
| Operating Junction Temperature Range   | TJ     | -40                         | —       | +125 | °C   |
| Operating Ambient Temperature Range  | TA     | -40                         | —       | +85  | °C   |
| <b>V-temp Temperature Devices</b>  |        |                             |         |      |      |
| Operating Junction Temperature Range   | TJ     | -40                         | —       | +140 | °C   |
| Operating Ambient Temperature Range  | TA     | -40                         | —       | +105 | °C   |
| Power Dissipation:<br>Internal Chip Power Dissipation:<br>$P_{INT} = V_{DD} \times (I_{DD} - S_{IOH})$<br>I/O Pin Power Dissipation:<br>$I/O = S \{ (V_{DD} - V_{OH}) \times I_{OH} \} + S \{ V_{OL} \times I_{OL} \}$ | PD     | PINT + PI/O                 |         |      | W    |
| Maximum Allowed Power Dissipation  | PDMAX  | $(T_J - T_A) / \theta_{JA}$ |         |      | W    |

**TABLE 30-3: THERMAL PACKAGING CHARACTERISTICS**

| Characteristics                          | Symbol        | Typical | Max. | Unit | Notes |
|--|---------------|---------|------|------|-------|
| Package Thermal Resistance, 28-pin SSOP  | $\theta_{JA}$ | 71      | —    | °C/W | 1     |
| Package Thermal Resistance, 28-pin SOIC  | $\theta_{JA}$ | 50      | —    | °C/W | 1     |
| Package Thermal Resistance, 28-pin SPDIP | $\theta_{JA}$ | 42      | —    | °C/W | 1     |
| Package Thermal Resistance, 28-pin QFN   | $\theta_{JA}$ | 35      | —    | °C/W | 1     |
| Package Thermal Resistance, 36-pin VTLA  | $\theta_{JA}$ | 31      | —    | °C/W | 1     |
| Package Thermal Resistance, 44-pin QFN   | $\theta_{JA}$ | 32      | —    | °C/W | 1     |
| Package Thermal Resistance, 44-pin TQFP  | $\theta_{JA}$ | 45      | —    | °C/W | 1     |
| Package Thermal Resistance, 44-pin VTLA  | $\theta_{JA}$ | 30      | —    | °C/W | 1     |

**Note 1:** Junction to ambient thermal resistance, Theta-JA ( $\theta_{JA}$ ) numbers are achieved by package simulations.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 30-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS**

| DC CHARACTERISTICS       |        |  | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial<br>$-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$ for V-temp |      |       |                  |            |
|--------------------------|--------|--|---|------|-------|------------------|------------|
| Param. No.               | Symbol | Characteristics  | Min.  | Typ. | Max.  | Units            | Conditions |
| <b>Operating Voltage</b> |        |  |   |      |       |                  |            |
| DC10                     | VDD    | Supply Voltage (Note 2)                                    | 2.3   | —    | 3.6   | V                | —          |
| DC12                     | VDR    | RAM Data Retention Voltage (Note 1)                        | 1.75  | —    | —     | V                | —          |
| DC16                     | VPOR   | VDD Start Voltage to Ensure Internal Power-on Reset Signal | 1.75  | —    | 2.1   | V                | —          |
| DC17                     | SVDD   | VDD Rise Rate to Ensure Internal Power-on Reset Signal     | 0.00005   | —    | 0.115 | V/ $\mu\text{s}$ | —          |

**Note 1:** This is the limit to which VDD can be lowered without losing RAM data.

- 2:** Overall functional device operation at  $V_{BORMIN} < VDD < VDDMIN$  is tested, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN. Refer to parameter BO10 in [Table 30-11](#) for BOR values.

**TABLE 30-5: DC CHARACTERISTICS: OPERATING CURRENT (IDD)**

| DC CHARACTERISTICS                             |                        |      | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +105°C for V-temp |                 |                        |
|--|------------------------|------|---|-----------------|------------------------|
| Parameter No.                                  | Typical <sup>(3)</sup> | Max. | Units   | Conditions      |                        |
| <b>Operating Current (IDD) (Notes 1, 2, 5)</b> |                        |      |   |                 |                        |
| DC20   | 2                      | 3    | mA  | 4 MHz (Note 4)  |                        |
| DC21   | 7                      | 10.5 | mA  | 10 MHz          |                        |
| DC22   | 10                     | 15   | mA  | 20 MHz (Note 4) |                        |
| DC23   | 15                     | 23   | mA  | 30 MHz (Note 4) |                        |
| DC24   | 20                     | 30   | mA  | 40 MHz          |                        |
| DC25   | 100                    | 150  | µA  | +25°C, 3.3V     | LPRC (31 kHz) (Note 4) |

- Note 1:** A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, execution from Program Flash memory vs. SRAM, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.
- 2:** The test conditions for IDD measurements are as follows:
- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
  - OSC2/CLKO is configured as an I/O input pin
  - USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
  - CPU, Program Flash, and SRAM data memory are operational, SRAM data memory Wait states = 1
  - No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
  - WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
  - All I/O pins are configured as inputs and pulled to Vss
  - MCLR = VDD
  - CPU executing while(1) statement from Flash
  - RTCC and JTAG are disabled
- 3:** Data in "Typical" column is at 3.3V, 25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.
- 4:** This parameter is characterized, but not tested in manufacturing.
- 5:** IPD electrical characteristics for devices with 256 KB Flash are only provided as Preliminary information.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 30-6: DC CHARACTERISTICS: IDLE CURRENT (I<sub>IDLE</sub>)**

| DC CHARACTERISTICS   |                        |      | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature -40°C ≤ T <sub>A</sub> ≤ +85°C for Industrial<br>-40°C ≤ T <sub>A</sub> ≤ +105°C for V-temp |                          |      |                                    |
|--|------------------------|------|---|--------------------------|------|------------------------------------|

| D156               |                 | OSC1   | —  | —                      | ±1                   | μA    |   |

**Note 1:** Data in “Typical” column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

- 2:** The leakage current on the  $\overline{\text{MCLR}}$  pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** This parameter is characterized, but not tested in manufacturing.
- 5:** See the “Pin Diagrams” section for the 5V-tolerant pins.
- 6:** The V<sub>IH</sub> specifications are only in relation to externally applied inputs, and not with respect to the user-selectable internal pull-ups. External open drain input signals utilizing the internal pull-ups of the PIC32 device are guaranteed to be recognized only as a logic “high” internally to the PIC32 device, provided that the external load does not exceed the minimum value of ICNPU. For External “input” logic inputs that require a pull-up source, to guarantee the minimum V<sub>IH</sub> of those components, it is recommended to use an external pull-up resistor rather than the internal pull-ups of the PIC32 device.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 30-9: DC CHARACTERISTICS: I/O PIN INPUT INJECTION CURRENT SPECIFICATIONS**

| DC CHARACTERISTICS |                   |  | Standard Operating Conditions: 2.3V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +105°C for V-temp |                     |                       |       |  |
|--------------------|-------------------|--|--|---------------------|-----------------------|-------|--|
| Param. No.         | Symbol            | Characteristics  | Min.   | Typ. <sup>(1)</sup> | Max.                  | Units | Conditions   |
| DI60a              | I <sub>ICL</sub>  | <b>Input Low Injection Current</b>                                     | 0  | —                   | -5 <sup>(2,5)</sup>   | mA    | This parameter applies to all pins, with the exception of the power pins.  |
| DI60b              | I <sub>ICH</sub>  | <b>Input High Injection Current</b>                                    | 0  | —                   | +5 <sup>(3,4,5)</sup> | mA    | This parameter applies to all pins, with the exception of all 5V tolerant pins, and the SOSCI, SOSCO, OSC1, D+, and D- pins.                       |
| DI60c              | ∑I <sub>ICT</sub> | <b>Total Input Injection Current (sum of all I/O and Control pins)</b> | -20 <sup>(6)</sup>   | —                   | +20 <sup>(6)</sup>    | mA    | Absolute instantaneous sum of all ± input injection currents from all I/O pins (   I <sub>ICL</sub> +   I <sub>ICH</sub>   ) ≤ ∑I <sub>ICT</sub> ) |

- Note 1:** Data in “Typical” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- 2:** V<sub>IL</sub> source < (V<sub>SS</sub> - 0.3). Characterized but not tested.
- 3:** V<sub>IH</sub> source > (V<sub>DD</sub> + 0.3) for non-5V tolerant pins only.
- 4:** Digital 5V tolerant pins do not have an internal high side diode to V<sub>DD</sub>, and therefore, cannot tolerate any “positive” input injection current.
- 5:** Injection currents > | 0 | can affect the ADC results by approximately 4 to 6 counts (i.e., V<sub>IH</sub> Source > (V<sub>DD</sub> + 0.3) or V<sub>IL</sub> source < (V<sub>SS</sub> - 0.3)).
- 6:** Any number and/or combination of I/O pins not excluded under I<sub>ICL</sub> or I<sub>ICH</sub> conditions are permitted provided the “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. If **Note 2**, I<sub>ICL</sub> = (((V<sub>SS</sub> - 0.3) - V<sub>IL</sub> source) / R<sub>S</sub>). If **Note 3**, I<sub>ICH</sub> = ((I<sub>ICH</sub> source - (V<sub>DD</sub> + 0.3)) / R<sub>S</sub>). R<sub>S</sub> = Resistance between input source voltage and device pin. If (V<sub>SS</sub> - 0.3) ≤ V<sub>SOURCE</sub> ≤ (V<sub>DD</sub> + 0.3), injection current = 0.

| D137                                      | TPE    | Page Erase Cycle Time             | —   | 20011                  | —    |            | See <b>Note 4</b>                             |
|   | TCE    | Chip Erase Cycle Time             | —   | 80180                  | —    |            | See <b>Note 4</b>                             |

- Note 1:** Data in “Typical” column is at 3.3V, 25°C unless otherwise stated.
- 2:** The minimum SYSCLK for row programming is 4 MHz. Care should be taken to minimize bus activities during row programming, such as suspending any memory-to-memory DMA operations. If heavy bus loads are expected, selecting Bus Matrix Arbitration mode 2 (rotating priority) may be necessary. The default Arbitration mode is mode 1 (CPU has lowest priority).
- 3:** Refer to the “PIC32 Flash Programming Specification” (DS60001145) for operating conditions during programming and erase cycles.
- 4:** Translating this value to seconds depends on the FRC accuracy (See [Table 30-19](#)) and FRC tuning values (See [Register 8-2](#)).

| OS41               | TFSCM         | Primary Clock Fail Safe<br>Time-out Period   | —   | 2                      | —           | ms         | (Note 4)                                |
| OS42               | GM            | External Oscillator<br>Transconductance (Primary<br>Oscillator only)   | —   | 12                     | —           | mA/V       | VDD = 3.3V,<br>TA = +25°C<br>(Note 4)   |

**Note 1:** Data in "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are characterized but are not tested.

**2:** Instruction cycle period (Tcy) equals the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1/CLKI pin.

**3:** PLL input requirements: 4 MHz ≤ FPLLIN ≤ 5 MHz (use PLL prescaler to reduce FOSC). This parameter is characterized, but tested at 10 MHz only at manufacturing.

**4:** This parameter is characterized, but not tested in manufacturing.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 30-18: PLL CLOCK TIMING SPECIFICATIONS**

| AC CHARACTERISTICS |        | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +105°C for V-temp |       |         |       |       |                                   |
|--------------------|--------|---|-------|---------|-------|-------|-----------------------------------|
| Param. No.         | Symbol | Characteristics <sup>(1)</sup>  | Min.  | Typical | Max.  | Units | Conditions                        |
| OS50               | FPLLI  | PLL Voltage Controlled Oscillator (VCO) Input Frequency Range   | 3.92  | —       | 5     | MHz   | ECPLL, HSPLL, XTPLL, FRCPLL modes |
| OS51               | FSYS   | On-Chip VCO System Frequency  | 60    | —       | 120   | MHz   | —                                 |
| OS52               | TLOCK  | PLL Start-up Time (Lock Time)   | —     | —       | 2     | ms    | —                                 |
| OS53               | DCLK   | CLKO Stability <sup>(2)</sup><br>(Period Jitter or Cumulative)  | -0.25 | —       | +0.25 | %     | Measured over 100 ms period       |

**Note 1:** These parameters are characterized, but not tested in manufacturing.

**Note 2:** This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{SYSCLK}{CommunicationClock}}}$$

For example, if SYSCLK = 40 MHz and SPI bit rate = 20 MHz, the effective jitter is as follows:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{40}{20}}} = \frac{D_{CLK}}{1.41}$$

**TABLE 30-19: INTERNAL FRC ACCURACY**

**Note 1:** BRG is the value of the I<sup>2</sup>C Baud Rate Generator.

**2:** Maximum pin capacitance = 10 pF for all I2Cx pins (for 1 MHz mode only).

**3:** The typical value for this parameter is 104 ns.

**Note 1:** Nominal value at center point of current trim range (CTMUCON<15:10> = 000000).

**Note 2:** Parameters are characterized but not tested in manufacturing. Measurements taken with the following conditions:

- VREF+ = AVDD = 3.3V
- ADC module configured for conversion speed of 500 ksp/s
- All PMD bits are cleared (PMDx = 0)
- Executing a `while(1)` statement
- Device operating from the FRC with no PLL

**Note 3:** The CTMU module is functional at  $V_{BORMIN} < V_{DD} < V_{DDMIN}$ , but with degraded performance. Unless otherwise stated, module functionality is tested, but not characterized.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 31.0 50 MHz ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MX1XX/2XX 28/36/44-pin Family electrical characteristics for devices operating at 50 MHz.

The specifications for 50 MHz are identical to those shown in [Section 30.0 “Electrical Characteristics”](#), with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter “M”, which denotes 50 MHz operation. For example, parameter DC29a in [Section 30.0 “Electrical Characteristics”](#), is the up to 40 MHz operation equivalent for MDC29a.

Absolute maximum ratings for the PIC32MX1XX/2XX 28/36/44-pin Family 50 MHz devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings

(See Note 1)

|  |                           |
|--|---------------------------|
| Ambient temperature under bias .....   | -40°C to +85°C            |
| Storage temperature .....  | -65°C to +150°C           |
| Voltage on VDD with respect to VSS .....   | -0.3V to +4.0V            |
| Voltage on any pin that is not 5V tolerant, with respect to VSS ( <b>Note 3</b> ) .....    | -0.3V to (VDD + 0.3V)     |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 2.3V ( <b>Note 3</b> ) ..... | -0.3V to +5.5V            |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 2.3V ( <b>Note 3</b> ) ..... | -0.3V to +3.6V            |
| Voltage on D+ or D- pin with respect to VUSB3V3 .....                                      | -0.3V to (VUSB3V3 + 0.3V) |
| Voltage on VBUS with respect to VSS .....  | -0.3V to +5.5V            |
| Maximum current out of VSS pin(s) .....  | 300 mA                    |
| Maximum current into VDD pin(s) ( <b>Note 2</b> ) .....                                    | 300 mA                    |
| Maximum output current sunk by any I/O pin .....   | 15 mA                     |
| Maximum output current sourced by any I/O pin .....  | 15 mA                     |
| Maximum current sunk by all ports .....  | 200 mA                    |
| Maximum current sourced by all ports ( <b>Note 2</b> ) .....                               | 200 mA                    |

**Note 1:** Stresses above those listed under “**Absolute Maximum Ratings**” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**2:** Maximum allowable current is a function of device maximum power dissipation (see [Table 30-2](#)).

**3:** See the “[Pin Diagrams](#)” section for the 5V tolerant pins.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## 31.1 DC Characteristics

**TABLE 31-1: OPERATING MIPS VS. VOLTAGE**

| Characteristic | VDD Range<br>(in Volts) <sup>(1)</sup> | Temp. Range<br>(in °C) | Max. Frequency                     |
|----------------|--|------------------------|------------------------------------|
|                |  |                        | PIC32MX1XX/2XX 28/36/44-pin Family |
| MDC5           | 2.3-3.6V                               | -40°C to +85°C         | 50 MHz                             |

**Note 1:** Overall functional device operation at  $V_{BORMIN} < V_{DD} < V_{DDMIN}$  is tested, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below  $V_{DDMIN}$ . Refer to parameter BO10 in [Table 30-11](#) for BOR values.

**TABLE 31-2: DC CHARACTERISTICS: OPERATING CURRENT (IDD)**

| DC CHARACTERISTICS                         |                        |      | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial |            |
|--|------------------------|------|--|------------|
| Parameter No.                              | Typical <sup>(3)</sup> | Max. | Units  | Conditions |
| <b>Operating Current (IDD) (Note 1, 2)</b> |                        |      |  |            |
| MDC24                                      | 25                     | 37   | mA   | 50 MHz     |

**Note 1:** A device's  $I_{DD}$  supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, execution from Program Flash memory vs. SRAM, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

**2:** The test conditions for  $I_{DD}$  measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
- CPU, Program Flash, and SRAM data memory are operational, SRAM data memory Wait states = 1
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
- WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to  $V_{SS}$
- $\overline{\text{MCLR}} = V_{DD}$
- CPU executing `while(1)` statement from Flash

**3:** RTCC and JTAG are disabled

**4:** Data in "Typical" column is at 3.3V, 25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 31-3: DC CHARACTERISTICS: IDLE CURRENT (I<sub>IDLE</sub>)**

| DC CHARACTERISTICS   |                        |      | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial |            |  |
|--|------------------------|------|--|------------|--|
| Parameter No.  | Typical <sup>(2)</sup> | Max. | Units  | Conditions |  |
| <b>Idle Current (I<sub>IDLE</sub>): Core Off, Clock on Base Current (Note 1)</b> |                        |      |  |            |  |
| MDC34a   | 8                      | 13   | mA   | 50 MHz     |  |

**Note 1:** The test conditions for I<sub>IDLE</sub> current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
- CPU is in Idle mode (CPU core Halted), and SRAM data memory Wait states = 1
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
- WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V<sub>SS</sub>
- $\overline{\text{MCLR}} = \text{V}_{\text{DD}}$
- RTCC and JTAG are disabled

**2:** Data in the "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**TABLE 31-4: DC CHARACTERISTICS: POWER-DOWN CURRENT (I<sub>PD</sub>)**

| DC CHARACTERISTICS                                  |                        |      | Standard Operating Conditions: 2.3V to 3.6V (unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial |            |  |
|---|------------------------|------|---|------------|--|
| Param. No.  | Typical <sup>(2)</sup> | Max. | Units   | Conditions |  |
| <b>Power-Down Current (I<sub>PD</sub>) (Note 1)</b> |                        |      |   |            |  |
| MDC40k  | 10                     | 25   | μA  | -40°C      | Base Power-Down Current  |
| MDC40n  | 250                    | 500  | μA  | +85°C      |  |
| <b>Module Differential Current</b>                  |                        |      |   |            |  |
| MDC41e  | 10                     | 55   | μA  | 3.6V       | Watchdog Timer Current: $\Delta I_{\text{WDT}}$ ( <b>Note 3</b> )          |
| MDC42e  | 23                     | 55   | μA  | 3.6V       | RTCC + Timer1 w/32 kHz Crystal: $\Delta I_{\text{RTCC}}$ ( <b>Note 3</b> ) |
| MDC43d  | 1100                   | 1300 | μA  | 3.6V       | ADC: $\Delta I_{\text{ADC}}$ ( <b>Notes 3,4</b> )                          |

**Note 1:** The test conditions for I<sub>PD</sub> current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
- CPU is in Sleep mode, and SRAM data memory Wait states = 1
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is set
- WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V<sub>SS</sub>
- $\overline{\text{MCLR}} = \text{V}_{\text{DD}}$
- RTCC and JTAG are disabled

**2:** Data in the "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**3:** The  $\Delta$  current is the additional current consumed when the module is enabled. This current should be added to the base I<sub>PD</sub> current.

**4:** Test conditions for ADC module differential current are as follows: Internal ADC RC oscillator enabled.

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE 31-5: EXTERNAL CLOCK TIMING REQUIREMENTS**

| AC CHARACTERISTICS |        |   | Standard Operating Conditions: 2.3V to 3.6V<br>(unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial |         |          |            |                               |
|--------------------|--------|---|--|---------|----------|------------|-------------------------------|

## 32.0 DC AND AC DEVICE CHARACTERISTICS GRAPHS

**Note:** The graphs provided following this note are a statistical summary based on a limited number of samples and are provided for design guidance purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

## 33.0 PACKAGING INFORMATION

### 33.1 Package Marking Information

28-Lead SOIC

Example

28-Lead SPDIP

Example

28-Lead SSOP

Example

28-Lead QFN

Example

|   |        |  |
|---|--------|--|
| <b>Legend:</b>  | XX...X | Customer-specific information  |
|   | Y      | Year code (last digit of calendar year)  |
|   | YY     | Year code (last 2 digits of calendar year)   |
|   | WW     | Week code (week of January 1 is week '01')   |
|   | NNN    | Alphanumeric traceability code   |
|   | (e3)   | Pb-free JEDEC designator for Matte Tin (Sn)  |
|   | *      | This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package. |
| <b>Note:</b> If the full Microchip part number cannot be marked on one line, it is carried over to the next line, thus limiting the number of available characters for customer-specific information. |        |  |

## 33.2 Package Details

This section provides the technical details of the packages.

### 28-Lead Plastic Shrink Small Outline (SS) – 5.30 mm Body [SSOP]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

| Dimension Limits         | Units  | MILLIMETERS |       |       |
|--------------------------|--------|-------------|-------|-------|
|                          |        | MIN         | NOM   | MAX   |
| Number of Pins           | N      | 28          |       |       |
| Pitch                    | e      | 0.65 BSC    |       |       |
| Overall Height           | A      | –           | –     | 2.00  |
| Molded Package Thickness | A2     | 1.65        | 1.75  | 1.85  |
| Standoff                 | A1     | 0.05        | –     | –     |
| Overall Width            | E      | 7.40        | 7.80  | 8.20  |
| Molded Package Width     | E1     | 5.00        | 5.30  | 5.60  |
| Overall Length           | D      | 9.90        | 10.20 | 10.50 |
| Foot Length              | L      | 0.55        | 0.75  | 0.95  |
| Footprint                | L1     | 1.25 REF    |       |       |
| Lead Thickness           | c      | 0.09        | –     | 0.25  |
| Foot Angle               | $\phi$ | 0°          | 4°    | 8°    |
| Lead Width               | b      | 0.22        | –     | 0.38  |

**Notes:**

- Pin 1 visual index feature may vary, but must be located within the hatched area.
- Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.20 mm per side.
- Dimensioning and tolerancing per ASME Y14.5M.
  - BSC: Basic Dimension. Theoretically exact value shown without tolerances.
  - REF: Reference Dimension, usually without tolerance, for information purposes only.

## APPENDIX A: REVISION HISTORY

### Revision A (May 2011)

This is the initial released version of this document.

### Revision B (October 2011)

The following two global changes are included in this revision:

- All packaging references to VLAP have been changed to VTLA throughout the document
- All references to VCORE have been removed
- All occurrences of the ASCL1, ASCL2, ASDA1, and ASDA2 pins have been removed
- V-temp temperature range (-40°C to +105°C) was added to all electrical specification tables

This revision includes the addition of the following devices:

- PIC32MX130F064B
- PIC32MX130F064C
- PIC32MX130F064D
- PIC32MX150F128B
- PIC32MX150F128C
- PIC32MX150F128D
- PIC32MX230F064B
- PIC32MX230F064C
- PIC32MX230F064D
- PIC32MX250F128B
- PIC32MX250F128C
- PIC32MX250F128D

Text and formatting changes were incorporated throughout the document.

All other major changes are referenced by their respective section in [Table A-1](#).

**TABLE A-1: MAJOR SECTION UPDATES**

| Section  | Update Description  |
|--|---|
| “32-bit Microcontrollers (up to 128 KB Flash and 32 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog” | <p>Split the existing Features table into two: PIC32MX1XX General Purpose Family Features (Table 1) and PIC32MX2XX USB Family Features (Table 2).</p> <p>Added the SPDIP package reference (see Table 1, Table 2, and “<b>Pin Diagrams</b>”).</p> <p>Added the new devices to the applicable pin diagrams.</p> <p>Changed PGED2 to PGED1 on pin 35 of the 36-pin VTLA diagram for PIC32MX220F032C, PIC32MX220F016C, PIC32MX230F064C, and PIC32MX250F128C devices.</p> |
| <b>1.0 “Device Overview”</b>   | <p>Added the SPDIP package reference and updated the pin number for AN12 for 44-pin QFN devices in the Pinout I/O Descriptions (see Table 1-1).</p> <p>Added the PGEC4/PGED4 pin pair and updated the C1INA-C1IND and C2INA-C2IND pin numbers for 28-pin SSOP/SPDIP/SOIC devices in the Pinout I/O Descriptions (see Table 1-1).</p>  |
| <b>2.0 “Guidelines for Getting Started with 32-bit Microcontrollers”</b>   | <p>Updated the Recommended Minimum Connection diagram (see Figure 2-1).</p>   |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)**

| Section  | Update Description  |
|--|---|
| <b>4.0 “Memory Organization”</b>                       | <p>Added Memory Maps for the new devices (see Figure 4-3 and Figure 4-4).</p> <p>Removed the BMXCHEDMA bit from the Bus Matrix Register map (see Table 4-1).</p> <p>Added the REFOTRIM register, added the DIVSWEN bit to the REFOCON registers, added Note 4 to the ULOCK and SOSSEN bits and added the PBDIVRDY bit in the OSCCON register in the in the System Control Register map (see Table 4-16).</p> <p>Removed the ALTI2C1 and ALTI2C2 bits from the DEVCFG3 register and added Note 1 to the UPLEN and UPLLDIV&lt;2:0&gt; bits of the DEVCFG2 register in the Device Configuration Word Summary (see Table 4-17).</p> <p>Updated Note 1 in the Device and Revision ID Summary (see Table 4-18).</p> <p>Added Note 2 to the PORTA Register map (see Table 4-19).</p> <p>Added the ANSB6 and ANSB12 bits to the ANSELB register in the PORTB Register map (see Table 4-20).</p> <p>Added Notes 2 and 3 to the PORTC Register map (see Table 4-21).</p> <p>Updated all register names in the Peripheral Pin Select Register map (see Table 4-23).</p> <p>Added values in support of new devices (16 KB RAM and 32 KB RAM) in the Data RAM Size register (see Register 4-5).</p> <p>Added values in support of new devices (64 KB Flash and 128 KB Flash) in the Data RAM Size register (see Register 4-5).</p> |
| <b>8.0 “Oscillator Configuration”</b>                  | <p>Added Note 5 to the PIC32MX1XX/2XX Family Clock Diagram (see Figure 8-1).</p> <p>Added the PBDIVRDY bit and Note 2 to the Oscillator Control register (see Register 8-1).</p> <p>Added the DIVSWEN bit and Note 3 to the Reference Oscillator Control register (see Register 8-3).</p> <p>Added the REFOTRIM register (see Register 8-4).</p>  |
| <b>21.0 “10-bit Analog-to-Digital Converter (ADC)”</b> | <p>Updated the ADC1 Module Block Diagram (see Figure 21-1).</p> <p>Updated the Notes in the ADC Input Select register (see Register 21-4).</p>  |
| <b>24.0 “Charge Time Measurement Unit (CTMU)”</b>      | <p>Updated the CTMU Block Diagram (see Figure 24-1).</p> <p>Added Note 3 to the CTMU Control register (see Register 24-1)</p>   |
| <b>26.0 “Special Features”</b>                         | <p>Added Note 1 and the PGEC4/PGED4 pin pair to the ICESSEL&lt;1:0&gt; bits in DEVCFG0: Device Configuration Word 0 (see Register 26-1).</p> <p>Removed the ALTI2C1 and ALTI2C2 bits from the Device Configuration Word 3 register (see Register 26-4).</p> <p>Removed 26.3.3 “Power-up Requirements”.</p> <p>Added Note 3 to the Connections for the On-Chip Regulator diagram (see Figure 26-2).</p> <p>Updated the Block Diagram of Programming, Debugging and Trace Ports diagram (see Figure 26-3).</p>  |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

**TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)**

| Section                                  | Update Description   |
|--|--|
| <b>29.0 “Electrical Characteristics”</b> | <p>Updated the Absolute Maximum Ratings (removed Voltage on V<sub>CORE</sub> with respect to V<sub>SS</sub>).</p> <p>Added the SPDIP specification to the Thermal Packaging Characteristics (see Table 29-2).</p> <p>Updated the Typical values for parameters DC20-DC24 in the Operating Current (I<sub>DD</sub>) specification (see Table 29-5).</p> <p>Updated the Typical values for parameters DC30a-DC34a in the Idle Current (I<sub>IDLE</sub>) specification (see Table 29-6).</p> <p>Updated the Typical values for parameters DC40i and DC40n and removed parameter DC40m in the Power-down Current (I<sub>PD</sub>) specification (see Table 29-7).</p> <p>Removed parameter D320 (V<sub>CORE</sub>) from the Internal Voltage Regulator Specifications and updated the Comments (see Table 29-13).</p> <p>Updated the Minimum, Typical, and Maximum values for parameter F20b in the Internal FRC Accuracy specification (see Table 29-17).</p> <p>Removed parameter SY01 (TPWRT) and removed all Conditions from Resets Timing (see Table 29-20).</p> <p>Updated all parameters in the CTMU Specifications (see Table 29-39).</p> |
| <b>31.0 “Packaging Information”</b>      | Added the 28-lead SPDIP package diagram information (see <b>31.1 “Package Marking Information”</b> and <b>31.2 “Package Details”</b> ).  |
| “Product Identification System”          | Added the SPDIP (SP) package definition.   |

## Revision C (November 2011)

All major changes are referenced by their respective section in [Table A-2](#).

**TABLE A-2: MAJOR SECTION UPDATES**

| Section  | Update Description  |
|--|---|
| “32-bit Microcontrollers (up to 128 KB Flash and 32 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog” | <p>Revised the source/sink on I/O pins (see “<b>Input/Output</b>” on page 1).</p> <p>Added the SPDIP package to the PIC32MX220F032B device in the PIC32MX2XX USB Family Features (see Table 2).</p> |
| <b>4.0 “Memory Organization”</b>   | Removed ANSB6 from the ANSELB register and added the ODCB6, ODCB10, and ODCB11 bits in the PORTB Register Map (see Table 4-20).   |
| <b>29.0 “Electrical Characteristics”</b>   | Updated the minimum value for parameter OS50 in the PLL Clock Timing Specifications (see Table 29-16).  |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## Revision D (February 2012)

All occurrences of VUSB were changed to: VUSB3V3. In addition, text and formatting changes were incorporated throughout the document.

All other major changes are referenced by their respective section in [Table A-3](#).

**TABLE A-3: MAJOR SECTION UPDATES**

| Section  | Update Description  |
|--|---|
| “32-bit Microcontrollers (up to 128 KB Flash and 32 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog” | Corrected a part number error in all pin diagrams.<br>Updated the DMA Channels (Programmable/Dedicated) column in the PIC32MX1XX General Purpose Family Features (see Table 1).   |
| <b>1.0 “Device Overview”</b>   | Added the TQFP and VTLA packages to the 44-pin column heading and updated the pin numbers for the SCL1, SCL2, SDA1, and SDA2 pins in the Pinout I/O Descriptions (see Table 1-1).   |
| <b>7.0 “Interrupt Controller”</b>  | Updated the Note that follows the features.<br>Updated the Interrupt Controller Block Diagram (see Figure 7-1).   |
| <b>29.0 “Electrical Characteristics”</b>   | Updated the Maximum values for parameters DC20-DC24, and the Minimum value for parameter DC21 in the Operating Current (IDD) DC Characteristics (see Table 29-5).<br>Updated all Minimum and Maximum values for the Idle Current (IIDL) DC Characteristics (see Table 29-6).<br>Updated the Maximum values for parameters DC40k, DC40l, DC40n, and DC40m in the Power-down Current (IPD) DC Characteristics (see Table 29-7).<br>Changed the minimum clock period for SCKx from 40 ns to 50 ns in Note 3 of the SPIx Master and Slave Mode Timing Requirements (see Table 29-26 through Table 29-29). |
| <b>30.0 “DC and AC Device Characteristics Graphs”</b>  | Updated the Typical IIDL Current @ VDD = 3.3V graph (see Figure 30-5).  |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## Revision E (October 2012)

All singular pin diagram occurrences of CVREF were changed to: CVREFOUT. In addition, minor text and formatting changes were incorporated throughout the document.

All major changes are referenced by their respective section in [Table A-4](#).

**TABLE A-4: MAJOR SECTION UPDATES**

| Section   | Update Description   |
|---|--|
| <b>“32-bit Microcontrollers (up to 128 KB Flash and 32 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog”</b> | Updated the following feature sections: <ul style="list-style-type: none"> <li>• <b>“Operating Conditions”</b></li> <li>• <b>“Communication Interfaces”</b></li> </ul>   |
| <b>2.0 “Guidelines for Getting Started with 32-bit MCUs”</b>  | Removed Section 2.8 “Configuration of Analog and Digital Pins During ICSP Operations”.   |
| <b>3.0 “CPU”</b>  | Removed references to GPR shadow registers in <b>3.1 “Features”</b> and <b>3.2.1 “Execution Unit”</b> .  |
| <b>4.0 “Memory Organization”</b>  | Updated the BRG bit range in the SPI1 and SPI2 Register Map (see Table 4-8).<br>Added the PWP<6> bit to the Device Configuration Word Summary (see Table 4-17).  |
| <b>5.0 “Flash Program Memory”</b>   | Added a note with Flash page size and row size information.  |
| <b>7.0 “Interrupt Controller”</b>   | Updated the TPC<2:0> bit definitions (see Register 7-1).<br>Updated the IPTMR<31:0> bit definition (see Register 7-3).   |
| <b>8.0 “Oscillator Configuration”</b>   | Updated the PIC32MX1XX/2XX Family Clock Diagram (see Figure 8-1).<br>Updated the RODIV<14:0> bit definitions (see Register 8-3).   |
| <b>10.0 “USB On-The-Go (OTG)”</b>   | Updated the Notes in the USB Interface Diagram (see Figure 10-1).  |
| <b>18.0 “Universal Asynchronous Receiver Transmitter (UART)”</b>  | Updated the baud rate range in the list of primary features.   |
| <b>26.0 “Special Features”</b>  | Added the PWP<6> bit to the Device Configuration Word 0 (see Register 26-1).   |
| <b>29.0 “Electrical Characteristics”</b>  | Added Note 1 to Operating MIPS vs. Voltage (see Table 29-1).<br>Added Note 2 to DC Temperature and Voltage Specifications (see Table 29-4).<br>Updated the Conditions for parameter DC25 in DC Characteristics: Operating Current (IDD) (see Table 29-5).<br>Added Note 2 to Electrical Characteristics: BOR (see Table 29-10).<br>Added Note 4 to Comparator Specifications (see Table 29-12).<br>Added Note 5 to ADC Module Specifications (see Table 29-32).<br>Updated the 10-bit Conversion Rate Parameters and added Note 3 (see Table 29-33).<br>Added Note 4 to the Analog-to-Digital Conversion Timing Requirements (see Table 29-34).<br>Added Note 3 to CTMU Current Source Specifications (see Table 29-39). |
| <b>30.0 “50 MHz Electrical Characteristics”</b>   | New chapter with electrical characteristics for 50 MHz devices.  |
| <b>31.0 “Packaging Information”</b>   | The 36-pin and 44-pin VTLA packages have been updated.   |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## Revision F (February 2014)

This revision includes the addition of the following devices:

- PIC32MX170F256B
- PIC32MX170F256D
- PIC32MX270F256B
- PIC32MX270F256D

In addition, this revision includes the following major changes as described in [Table A-5](#), as well as minor updates to text and formatting, which were incorporated throughout the document.

**TABLE A-5: MAJOR SECTION UPDATES**

| Section   | Update Description   |
|---|--|
| <b>32-bit Microcontrollers (up to 256 KB Flash and 64 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog</b> | Added new devices to the family features (see Table 1 and Table 2).<br>Updated pin diagrams to include new devices (see “Pin Diagrams”).   |
| <b>1.0 “Device Overview”</b>  | Added Note 3 reference to the following pin names: VBUS, VUSB3V3, VBUSON, D+, D-, and USBID.   |
| <b>2.0 “Guidelines for Getting Started with 32-bit MCUs”</b>  | Replaced Figure 2-1: Recommended Minimum Connection.<br>Updated Figure 2-2: MCLR Pin Connections.<br>Added <b>2.9 “Sosc Design Recommendation”</b> .   |
| <b>4.0 “Memory Organization”</b>  | Added memory tables for devices with 64 KB RAM (see Table 4-4 through Table 4-5).<br>Changed the Virtual Addresses for all registers and updated the PWP bits in the DEVCFG: Device Configuration Word Summary (see Table 4-17).<br>Updated the ODCA, ODCB, and ODCC port registers (see Table 4-19, Table 4-20, and Table 4-21).<br>The RTCTIME, RTCDATE, ALRMTIME, and ALRMDATE registers were updated (see Table 4-25).<br>Added Data Ram Size value for 64 KB RAM devices (see Register 4-5).<br>Added Program Flash Size value for 256 KB Flash devices (see Register 4-5). |
| <b>12.0 “Timer1”</b>  | The Timer1 block diagram was updated to include the 16-bit data bus (see Figure 12-1).   |
| <b>13.0 “Timer2/3, Timer4/5”</b>  | The Timer2-Timer5 block diagram (16-bit) was updated to include the 16-bit data bus (see Figure 13-1).<br>The Timer2/3, Timer4/5 block diagram (32-bit) was updated to include the 32-bit data bus (see Figure 13-1).  |
| <b>19.0 “Parallel Master Port (PMP)”</b>  | The CSF<1:0> bit value definitions for ‘00’ and ‘01’ were updated (see Register 19-1).<br>Bit 14 in the Parallel Port Address register (PMADDR) was updated (see Register 19-3).   |
| <b>20.0 “Real-Time Clock and Calendar (RTCC)”</b>   | The following registers were updated:<br>RTCTIME (see Register 20-3)<br>RTCDATE (see Register 20-4)<br>ALRMTIME (see Register 20-5)<br>ALRMDATE (see Register 20-6)  |
| <b>26.0 “Special Features”</b>  | Updated the PWP bits (see Register 26-1).  |
| <b>29.0 “Electrical Characteristics”</b>  | Added parameters DO50 and DO50a to the Capacitive Loading Requirements on Output Pins (see Table 29-14).<br>Added Note 5 to the IDD DC Characteristics (see Table 29-5).<br>Added Note 4 to the IDLE DC Characteristics (see Table 29-6).<br>Added Note 5 to the IPD DC Characteristics (see Table 29-7).<br>Updated the conditions for parameters USB321 (VOL) and USB322 (VOH) in the OTG Electrical Specifications (see Table 29-38).   |
| <b>Product Identification System</b>  | Added 40 MHz speed information.  |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## Revision G (April 2015)

This revision includes the addition of the following devices:

- PIC32MX130F256B
- PIC32MX230F256B
- PIC32MX130F256D
- PIC32MX230F256D

The title of the document was updated to avoid confusion with the PIC32MX1XX/2XX/5XX 64/100-pin Family data sheet.

All peripheral SFR maps have been relocated from the Memory chapter to their respective peripheral chapters.

In addition, this revision includes the following major changes as described in [Table A-6](#), as well as minor updates to text and formatting, which were incorporated throughout the document.

**TABLE A-6: MAJOR SECTION UPDATES**

| Section   | Update Description   |
|---|--|
| <b>32-bit Microcontrollers (up to 256 KB Flash and 64 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog</b> | Added new devices to the family features (see Table 1 and Table 2).<br>Updated pin diagrams to include new devices (see Pin Diagrams).   |
| <b>2.0 “Guidelines for Getting Started with 32-bit MCUs”</b>  | Updated these sections: <b>2.2 “Decoupling Capacitors”</b> , <b>2.3 “Capacitor on Internal Voltage Regulator (VCAP)”</b> , <b>2.4 “Master Clear (MCLR) Pin”</b> , <b>2.8.1 “Crystal Oscillator Design Consideration”</b> |
| <b>4.0 “Memory Organization”</b>  | Added Memory Map for new devices (see Figure 4-6).   |
| <b>14.0 “Watchdog Timer (WDT)”</b>  | New chapter created from content previously located in the Special Features chapter.   |
| <b>30.0 “Electrical Characteristics”</b>  | Removed parameter D312 (TSET) from the Comparator Specifications (see Table 30-12).<br>Added the Comparator Voltage Reference Specifications (see Table 30-13).<br>Updated Table 30-12.                                  |

## Revision H (July 2015)

This revision includes the following major changes as described in [Table A-7](#), as well as minor updates to text and formatting, which were incorporated throughout the document.

**TABLE A-7: MAJOR SECTION UPDATES**

| Section  | Update Description   |
|--|--|
| <b>2.0 “Guidelines for Getting Started with 32-bit MCUs”</b> | <b>Section 2.9 “Sosc Design Recommendation”</b> was removed.   |
| <b>8.0 “Oscillator Configuration”</b>                        | The Primary Oscillator (POsc) logic in the Oscillator diagram was updated (see Figure 8-1).  |
| <b>30.0 “Electrical Characteristics”</b>                     | The Power-Down Current (IPD) DC Characteristics parameter DC40k was updated (see <a href="#">Table 30-7</a> ).<br><b>Table 30-9: “DC Characteristics: I/O Pin Input Injection current Specifications”</b> was added. |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## Revision J (April 2016)

This revision includes the following major changes as described in [Table A-8](#), as well as minor updates to text and formatting, which were incorporated throughout the document.

**TABLE A-8: MAJOR SECTION UPDATES**

| Section  | Update Description   |
|--|--|
| <a href="#">“32-bit Microcontrollers (up to 256 KB Flash and 64 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog”</a> | The PIC32MX270FDB device and Note 4 were added to <a href="#">TABLE 2: “PIC32MX2XX 28/36/44-pin USB Family Features”</a> .                         |
| <a href="#">2.0 “Guidelines for Getting Started with 32-bit MCUs”</a>  | <a href="#">EXAMPLE 2-1: “Crystal Load Capacitor Calculation”</a> was updated.   |
| <a href="#">30.0 “Electrical Characteristics”</a>  | Parameter DO50a (Csosc) was removed from the Capacitive Loading Requirements on Output Pins AC Characteristics (see <a href="#">Table 30-16</a> ). |
| <a href="#">“Product Identification System”</a>  | The device mapping was updated to include type B for Software Targeting.   |

## Revision K (May 2018)

This revision includes the following major changes as described in [Table A-9](#), as well as minor updates to text and formatting, which were incorporated throughout the document.

**TABLE A-9: MAJOR SECTION UPDATES**

| Section  | Update Description   |
|--|--|
| <a href="#">“32-bit Microcontrollers (up to 256 KB Flash and 64 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog”</a> | The PIC32MX270F256DB device and Note 4 were removed from the PIC32MX2XX 28/36/44-Pin USB Family Features (see <a href="#">Table 2</a> ). |
| <a href="#">“Product Identification System”</a>  | Type B for Software Targeting was removed.   |
| <a href="#">Section 2.10 “Considerations When Interfacing To Remotely Powered Circuits”</a>  | A new section has been added.  |

# PIC32MX1XX/2XX 28/36/44-PIN FAMILY

## Revision L (September 2019)

This revision includes the following major changes as described in [Table A-10](#), as well as minor updates to text and formatting, which were incorporated throughout the document.

**TABLE A-10: MAJOR SECTION UPDATES**

| Section   | Update Description  |
|---|---|
| <a href="#">2.0 “Guidelines for Getting Started with 32-bit MCUs”</a> | Added new section <a href="#">2.11 “EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations”</a>   |
| <a href="#">17.0 “Serial Peripheral Interface (SPI)”</a>              | Updated information for the FRMPOL bit for <a href="#">Register 17-1: “SPIx CON: SPI Control Register”</a>  |
| <a href="#">20.0 “Parallel Master Port (PMP)”</a>                     | <ul style="list-style-type: none"><li>• Updated <a href="#">Register 20-2: “PMMODE: Parallel Port Mode Register”</a> with a new Note 3</li><li>• Updated Register <a href="#">Register 20-5: “PMSTAT: Parallel Port Status Register (Slave modes only)”</a> with a new Note 1</li></ul> |
| <a href="#">22.0 “10-bit Analog-to-Digital Converter (ADC)”</a>       | <ul style="list-style-type: none"><li>• Updated Note 2 of <a href="#">FIGURE 22-1: “ADC1 Module Block Diagram”</a></li><li>• Updated Note 4 of <a href="#">Register 22-4: “AD1CHS: ADC Input Select Register”</a></li></ul>   |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://microchip.com/support>**

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELoq® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
