1. Full rated V<sub>RRM</sub> and V<sub>RWM</sub> with 50% duty cycle is applicable over the range of T<sub>C</sub> = -55 °C to +165 °C for I<sub>FM</sub> = 0. Full rated continuous V<sub>R</sub> (dc) is applicable over the temperature range of T<sub>C</sub> = -55 to +155 °C. When V<sub>R</sub> = 45 V and T<sub>C</sub> = +155 °C, then T<sub>J</sub> = 175 °C.
  2. Average current with a 50 percent duty cycle square wave including reverse amplitude equal to the magnitude of full rated V<sub>RWM</sub>. Derate linearly at 0.625 A/°C for T<sub>C</sub> > +125 °C.
  3. Average current with an applied half-sine wave peak voltage value equal to the magnitude of full rated V<sub>RWM</sub>. For temperature-current derating curves, see [Figure 4](#).

**PART NOMENCLATURE**

**SYMBOLS & DEFINITIONS**

Symbol	Definition
f	Frequency
$I_{FM}$	Forward Current: The current flowing from the external circuit into the anode terminal. Also see first page ratings and test conditions for $I_{FM}$ with 50% duty cycle square wave.
$I_{FSM}$	Surge Peak Forward Current: The forward current including all nonrepetitive transient currents but excluding all repetitive transients (ref JESD282-B).
$I_O$	Average Rectified Forward Current: The output current averaged over a full cycle with a 50 Hz or 60 Hz sine-wave input and a 180 degree conduction angle.
$V_{FM}$	Maximum Forward Voltage
$V_R$	Reverse Voltage: A positive dc cathode-anode voltage below the breakdown region.
$V_{RRM}$	Repetitive Peak Reverse Voltage: The peak reverse voltage including all repetitive transient voltages but excluding all non-repetitive transient voltages.
