

MC74HC4538A

Dual Precision Monostable Multivibrator (Retriggerable, Resettable)

The MC74HC4538A is identical in pinout to the MC14538B. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This dual monostable multivibrator may be triggered by either the positive or the negative edge of an input pulse, and produces a precision output pulse over a wide range of pulse widths. Because the device has conditioned trigger inputs, there are no trigger–input rise and fall time restrictions. The output pulse width is determined by the external timing components, R_x and C_x . The device has a reset function which forces the Q output low and the \bar{Q} output high, regardless of the state of the output pulse circuitry.

Features

- Unlimited Rise and Fall Times Allowed on the Trigger Inputs
- Output Pulse is Independent of the Trigger Pulse Width
- $\pm 10\%$ Guaranteed Pulse Width Variation from Part to Part (Using the Same Test Jig)
- Output Drive Capability: 10 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS and TTL
- Operating Voltage Range: 3.0 to 6.0 V
- Low Input Current: 1.0 μA
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7 A
- Chip Complexity: 145 FETs or 36 Equivalent Gates
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC–Q100 Qualified and PPAP Capable
- These Devices are Pb–Free, Halogen Free and are RoHS Compliant

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. I_O absolute maximum rating must be observed.
2. Tested to EIA/JESD22-A114-A.
3. Tested to EIA/JESD22-A115-A.
4. Tested to JESD22-C101-A.
5. Tested to EIA/JESD78.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V _{CC}	DC Supply Voltage (Referenced to GND)	2.0	6.0	V
V _{in} , V _{out}	DC Input Voltage, Output Voltage (Referenced to GND)	0	V _{CC}	V
T _A	Operating Temperature, All Package Types	-55	+125	°C
t _r , t _f	Input Rise and Fall Time (Figure 6) V _{CC} = 2.0 V V _{CC} = 4.5 V V _{CC} = 6.0 V A or B (Figure 4)	0 0 0 -	1000 500 400 No Limit	ns
R _x	External Timing Resistor V _{CC} < 4.5 V V _{CC} ≥ 4.5 V	1.0 2.0	† †	kΩ
C _x	External Timing Capacitor	0	†	μF

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

† The maximum allowable values of R_x and C_x are a function of the leakage of capacitor C_x, the leakage of the HC4538A, and leakage due to board layout and surface resistance. For most applications, C_x/R_x should be limited to a maximum value of 10 μF/1.0 MΩ. Values of C_x > 1.0 μF may cause a problem during power down (see Power Down Considerations). Susceptibility to externally induced noise signals may occur for R_x > 1.0 MΩ.

6. Unused inputs may not be left open. All inputs must be tied to a high-logic voltage level or a low-logic input voltage level.

PIN DESCRIPTIONS

INPUTS

A1, A2 (Pins 4, 12)

Positive-edge trigger inputs. A rising-edge signal on either of these pins triggers the corresponding multivibrator when there is a high level on the B1 or B2 input.

B1, B2 (Pins 5, 11)

Negative-edge trigger inputs. A falling-edge signal on either of these pins triggers the corresponding multivibrator when there is a low level on the A1 or A2 input.

Reset 1, Reset 2 (Pins 3, 13)

Reset inputs (active low). When a low level is applied to one of these pins, the Q output of the corresponding multivibrator is reset to a low level and the \bar{Q} output is set to a high level.

C_{X1}/R_{X1} and C_{X2}/R_{X2} (Pins 2 and 14)

External timing components. These pins are tied to the common points of the external timing resistors and

capacitors (see the Block Diagram). Polystyrene capacitors are recommended for optimum pulse width control. Electrolytic capacitors are not recommended due to high leakages associated with these type capacitors.

GND (Pins 1 and 15)

External ground. The external timing capacitors discharge to ground through these pins.

OUTPUTS

Q1, Q2 (Pins 6, 10)

Noninverted monostable outputs. These pins (normally low) pulse high when the multivibrator is triggered at either the A or the B input. The width of the pulse is determined by the external timing components, R_X and C_X.

$\bar{Q}1, \bar{Q}2$ (Pins 7, 9)

Inverted monostable outputs. These pins (normally high) pulse low when the multivibrator is triggered at either the A or the B input. These outputs are the inverse of Q1 and Q2.

Figure 10. Logic Detail (1/2 the Device)

CIRCUIT OPERATION

Figure 11 shows the HC4538A configured in the retriggerable mode. Briefly, the device operates as follows (refer to Figure 10): In the quiescent state, the external timing capacitor, C_x , is charged to V_{CC} . When a trigger occurs, the Q output goes high and C_x discharges quickly to the lower reference voltage ($V_{ref\ Lower} \approx 1/3 V_{CC}$). C_x then charges, through R_x , back up to the upper reference voltage ($V_{ref\ Upper} \approx 2/3 V_{CC}$), at which point the one-shot has timed out and the Q output goes low.

The following, more detailed description of the circuit operation refers to both the logic detail (Figure 10) and the timing diagram (Figure 11).

QUIESCENT STATE

In the quiescent state, before an input trigger appears, the output latch is high and the reset latch is high (#1 in Figure 11). Thus the Q output (pin 6 or 10) of the monostable multivibrator is low (#2, Figure 11).

The output of the trigger-control circuit is low (#3), and transistors M1, M2, and M3 are turned off. The external timing capacitor, C_x , is charged to V_{CC} (#4), and both the upper and lower reference circuit has a low output (#5).

In addition, the output of the trigger-control reset circuit is low.

TRIGGER OPERATION

The HC4538A is triggered by either a rising-edge signal at input A (#7) or a falling-edge signal at input B (#8), with the unused trigger input and the Reset input held at the voltage levels shown in the Function Table. Either trigger signal will cause the output of the trigger-control circuit to go high (#9).

The trigger-control circuit going high simultaneously initiates two events. First, the output latch goes low, thus taking the Q output of the HC4538A to a high state (#10). Second, transistor M3 is turned on, which allows the external timing capacitor, C_x , to rapidly discharge toward ground (#11). (Note that the voltage across C_x appears at the input of both the upper and lower reference circuit comparator).

When C_x discharges to the reference voltage of the lower reference circuit (#12), the outputs of both reference circuits will be high (#13). The trigger-control reset circuit goes high, resetting the trigger-control circuit flip-flop to a low state (#14). This turns transistor M3 off again, allowing C_x to begin to charge back up toward V_{CC} , with a time constant $t = R_x C_x$ (#15). Once the voltage across C_x charges to above the lower reference voltage, the lower reference circuit will go low allowing the monostable multivibrator to be retriggered.

Figure 11. Timing Diagram

MC74HC4538A

When C_x charges up to the reference voltage of the upper reference circuit (#17), the output of the upper reference circuit goes low (#18). This causes the output latch to toggle, taking the Q output of the HC4538A to a low state (#19), and completing the time-out cycle.

POWER-DOWN CONSIDERATIONS

Large values of C_x may cause problems when powering down the HC4538A because of the amount of energy stored in the capacitor. When a system containing this device is powered down, the capacitor may discharge from V_{CC} through the input protection diodes at pin 2 or pin 14. Current through the protection diodes must be limited to 30 mA; therefore, the turn-off time of the V_{CC} power supply must not be faster than $t = V_{CC} \bullet C_x / (30 \text{ mA})$. For example, if $V_{CC} = 5.0 \text{ V}$ and $C_x = 15 \mu\text{F}$, the V_{CC} supply must turn off no faster than $t = (5.0 \text{ V}) \bullet (15 \mu\text{F}) / 30 \text{ mA} = 2.5 \text{ ms}$. This is usually not a problem because power supplies are heavily filtered and cannot discharge at this rate.

When a more rapid decrease of V_{CC} to zero volts occurs, the HC4538A may sustain damage. To avoid this possibility, use an external damping diode, D_x , connected as shown in Figure 12. Best results can be achieved if diode D_x is chosen to be a germanium or Schottky type diode able to withstand large current surges.

RESET AND POWER ON RESET OPERATION

A low voltage applied to the Reset pin always forces the Q output of the HC4538A to a low state.

The timing diagram illustrates the case in which reset occurs (#20) while C_x is charging up toward the reference voltage of the upper reference circuit (#21). When a reset

occurs, the output of the reset latch goes low (#22), turning on transistor M1. Thus C_x is allowed to quickly charge up to V_{CC} (#23) to await the next trigger signal.

On power up of the HC4538A the power-on reset circuit will be high causing a reset condition. This will prevent the trigger-control circuit from accepting a trigger input during this state. The HC4538A's Q outputs are low and the \bar{Q} not outputs are high.

RETRIGGER OPERATION

When used in the retriggerable mode (Figure 13), the HC4538A may be retriggered during timing out of the output pulse at any time after the trigger-control circuit flip-flop has been reset (#24), and the voltage across C_x is above the lower reference voltage. As long as the C_x voltage is below the lower reference voltage, the reset of the flip-flop is high, disabling any trigger pulse. This prevents M3 from turning on during this period resulting in an output pulse width that is predictable.

The amount of undershoot voltage on $R_x C_x$ during the trigger mode is a function of loop delay, M3 conductivity, and V_{DD} . Minimum retrigger time, t_{rr} (Figure 7), is a function of 1) time to discharge $R_x C_x$ from V_{DD} to lower reference voltage ($T_{\text{discharge}}$); 2) loop delay (T_{delay}); 3) time to charge $R_x C_x$ from the undershoot voltage back to the lower reference voltage (T_{charge}).

Figure 14 shows the device configured in the non-retriggerable mode.

For additional information, please see Application Note (AN1558/D) titled *Characterization of Retrigger Time in the HC4538A Dual Precision Monostable Multivibrator*.

MECHANICAL CASE OUTLINE

PACKAGE DIMENSIONS

ON Semiconductor®

TSSOP-16
CASE 948F-01
ISSUE B

DATE 19 OCT 2006

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A DOES NOT INCLUDE MOLD FLASH. PROTRUSIONS OR GATE BURRS. MOLD FLASH OR GATE BURRS SHALL NOT EXCEED 0.15 (0.006) PER SIDE.
4. DIMENSION B DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.25 (0.010) PER SIDE.
5. DIMENSION K DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 (0.003) TOTAL IN EXCESS OF THE K DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. TERMINAL NUMBERS ARE SHOWN FOR REFERENCE ONLY.
7. DIMENSION A AND B ARE TO BE DETERMINED AT DATUM PLANE -W-.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.90	5.10	0.193	0.200
B	4.30	4.50	0.169	0.177
C	---	1.20	---	0.047
D	0.05	0.15	0.002	0.006
F	0.50	0.75	0.020	0.030
G	0.65 BSC		0.026 BSC	
H	0.18	0.28	0.007	0.011
J	0.09	0.20	0.004	0.008
J1	0.09	0.16	0.004	0.006
K	0.19	0.30	0.007	0.012
K1	0.19	0.25	0.007	0.010
L	6.40 BSC		0.252 BSC	
M	0°	8°	0°	8°

SOLDERING FOOTPRINT

GENERIC MARKING DIAGRAM*

- XXXX = Specific Device Code
- A = Assembly Location
- L = Wafer Lot
- Y = Year
- W = Work Week
- G or ■ = Pb-Free Package

*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "■", may or may not be present.

ON Semiconductor and ON are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. ON Semiconductor does not convey any license under its patent rights nor the rights of others.

ON Semiconductor and  are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
