

NCP333

1.5 A Ultra-Small Controlled Load Switch with Auto-Discharge Path

Description

The NCP333 are low Ron MOSFET controlled by external logic pin, allowing optimization of battery life, and portable device autonomy.

Indeed, thanks to a current consumption optimization with PMOS structure, leakage currents are eliminated by isolating connected IC's on the battery when not used.

Output discharge path is also embedded to eliminate residual voltages on the output rail.

Proposed in a wide input voltage range from 1.2 V to 5.5 V, and a very small 0.76 x 0.76 mm WLCSP4, 0.4 pitch.

Features

- 1.2 V – 5.5 V Operating Range
- 55 mΩ P MOSFET at 3.3 V
- DC Current up to 1.5 A
- Output Auto-Discharge
- Active High EN Pin
- WLCSP4 0.76 x 0.76 mm
- This Device is Pb-Free, Halogen Free/BFR Free and is RoHS Compliant

Applications

- Mobile Phones
- Tablets
- Digital Cameras
- GPS
- Portable Devices

FUNCTIONAL DESCRIPTION

Overview

The NCP333 are a high side P channel MOSFET power distribution switch designed to isolate ICs connected on the battery in order to save energy. The part can be turned on, with a wide range of battery from 1.2 V to 5.5 V.

Enable Input

Enable pin is an active high. The path is opened when EN pin is tied low (disable), forcing P MOS switch off.

The IN/OUT path is activated with a minimum of V_{in} of 1.2 V and EN forced to high level.

Auto Discharge

NMOS FET is placed between the output pin and GND, in order to discharge the application capacitor connected on OUT pin.

The auto-discharge is activated when EN pin is set to low level (disable state).

The discharge path (Pull down NMOS) stays activated as long as EN pin is set at low level, and $V_{in} > 1.2$ V.

In order to limit the current across the internal discharge Nmosfet, the typical value is set at 70 Ω .

Soft Start

Each part has a gate soft start control (tr) in order to limit voltage ring when part is enable on a load.

Cin and Cout Capacitors

IN and OUT, 0.1 μ F, at least, capacitors must be placed as close as possible the part for stability improvement.

APPLICATION INFORMATION

Power Dissipation

Main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

- $P_D = R_{DS(on)} \times (I_{OUT})^2$

P_D = Power dissipation (W)

$R_{DS(on)}$ = Power MOSFET on resistance (Ω)

I_{OUT} = Output current (A)

- $T_J = P_D \times R_{\theta JA} + T_A$

T_J = Junction temperature ($^{\circ}$ C)

$R_{\theta JA}$ = Package thermal resistance ($^{\circ}$ C/W)

T_A = Ambient temperature ($^{\circ}$ C)

PCB Recommendations

The NCP333 integrates an up to 1.5 A rated PMOS FET, and the PCB design rules must be respected to properly evacuate the heat out of the silicon. By increasing PCB area, especially around IN and OUT pins, the $R_{\theta JA}$ of the package can be decreased, allowing higher power dissipation.

Figure 13. Routing Example: 2 oz, 4 Layers with Vias across 2 Internal Inners

Example of application definition.

$$T_J - T_A = R_{\theta JA} \times P_D = R_{\theta JA} \times R_{DS(on)} \times I^2$$

T_J : junction temperature.

T_A : ambient temperature.

$R_{\theta JA}$ = Thermal resistance between IC and air, through PCB.

$R_{DS(on)}$: intrinsic resistance of the IC Mosfet.

I: load DC current.

Taking into account of R_{θ} obtain with:

- 1 oz, 2 layers: 150°C/W.

At 1.5 A, 25°C ambient temperature, $R_{DS(on)}$ 45 mΩ @ V_{in} 5 V, the junction temperature will be:

$$T_J = T_A + R_{\theta JA} \times P_D = 25 + 150 \times 0.045 \times 1.5^2 = 40^\circ\text{C/W}$$
