## Handing \& Assembly Instructions

> Switching inductive and/or capacitive loads create voltage and/or current peaks, which may damage the relay. Protective circuits need to be used - see our website.
> External magnetic fields and magnetic effects, due to adjacent relays in high density matrices that may influence the relays' electrical characteristics, must be taken into consideration.
> Mechanical shock impacts, e.g. dropping the relays, may cause immediate or post-installation failure.
> Suppressing coil diode can have a negative influence on total number of switching cycles, especially by switching high voltage
> Wave soldering: maximum $260^{\circ} \mathrm{C} / 5$ seconds.
