Cavity **Bandpass Filters**

DC to 15 GHz 50Ω

The Big Deal

- Very low insertion loss with excellent power handling
- Very fast roll-off with wide stopband
- Passbands up to 15 GHz
- Stopbands up to 22 GHz

Product Overview

Mini-Circuits' cavity filters are designed by implementing resonant structures with very high Q and are ideal for narrow-band, high-selectivity applications. These designs can provide bandwidths as narrow as 1% with very high selectivity and excellent low noise floor. Low insertion loss combined with excellent power handling makes them well-suited for transmitter and receiver front end. Advanced filter design and construction enables stopband width greater than 3x the center frequency.

Mini-Circuits' cavity filters feature a special protective assembly to prevent accidental de-tuning that would otherwise require expensive replacement or return to factory for re-tuning. Precise machining allows realization of cavity filters with small form factors for applications where size is critical. Excellent repeatability across units is achieved through precise tuning and process control.

Key Features

Feature	Advantages		
Low insertion loss	Low signal loss results in better SNR in receiver front end and better power delivery to antenna in transmitter		
Fast roll-off	Higher selectivity results in better adjacent channel rejection and dynamic range		
Wide stopband	Wide spur free band results in better receiver sensitivity		
High power handling	Well suited for transmitter application		
Protective assembly	Prevents accidental de-tuning of precisely tuned resonant circuit

Features

- · Low insertion loss, 0.8 dB typical
- Broad stopband performance upto 22 GHz
- · High rejection

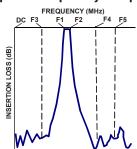

Applications

- · Fixed and satellite communication
- Mobile communication
- Broadcasting satellite
- Earth exploration satellite
- Aeronautical Radionavigation
