Buyer is responsible for its products and applications using onsemi products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by onsemi. "Typical" parameters which may be provided in onsemi data sheets and/ or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. onsemi does not convey any license under any of its intellectual property rights nor the rights of others. onsemi products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use onsemi products for any such unintended or unauthorized application,

# 3.3 V/5 V 8-Bit CMOS/ECL/TTL Data Input Parallel/Serial Converter

## Description

The MC10/100EP446 is an integrated 8-bit parallel to serial data converter. The device is designed with unique circuit topology to operate for NRZ data rates up to 3.2 Gb/s. The conversion sequence from parallel data into a serial data stream is from bit D0 to D7. The parallel input pins D0-D7 are configurable to be threshold controlled by CMOS, ECL, or TTL level signals. The serial data rate output can be selected at internal clock data rate or twice the internal clock data rate using the CKSEL pin.

Control pins are provided to reset (SYNC) and disable internal clock circuitry (CKEN). In either CKSEL modes, the internal flip-flops are triggered on the rising edge for CLK and the multiplexers are switched on the falling edge of CLK, therefore, all associated specification limits are referenced to the negative edge of the clock input. Additionally,  $V_{BB}$  pin is provided for single-ended input condition.

The 100 Series devices contain temperature compensation network.

#### **Features**

- 3.2 Gb/s Typical Data Rate Capability
- Differential Clock and Serial Outputs
- V<sub>BB</sub> Output for Single-ended Input Applications
- Asynchronous Data Reset (SYNC)
- PECL Mode Operating Range:

$$V_{CC} = 3.0 \text{ V}$$
 to 5.5 V with  $V_{EE} = 0 \text{ V}$ 

• NECL Mode Operating Range:

$$V_{CC} = 0 \text{ V}$$
 with  $V_{EE} = -3.0 \text{ V}$  to  $-5.5 \text{ V}$ 

- Open Input Default State
- Safety Clamp on Inputs
- Parallel Interface Can Support PECL, TTL or CMOS
- These Devices are Pb-Free and are RoHS Compliant

xxx = 10 or 100

A = Assembly Location

WL = Wafer Lot YY = Year WW = Work Week

G or ■ = Pb-Free Package

(Note: Microdot may be in either location)

\*For additional marking information, refer to Application Note AND8002/D.

#### ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 18 of this data sheet.

Warning: All  $\rm V_{CC}$  and  $\rm V_{EE}$  pins must be externally connected to Power Supply to guarantee proper operation.

| V <sub>BB1</sub> , V <sub>BB2</sub> | Reference Voltage Output                                   |  |
| V <sub>CC</sub>                     | Positive Supply  |  |
| V <sub>EE</sub>                     | Negative Supply  |  |

<sup>\*</sup> Pins will default LOW when left open.

<sup>\*\*</sup>Pins will default HIGH when left open.

<sup>\*\*\*</sup>The rising edge of SYNC will asynchronously reset the internal circuitry. The falling edge of the SYNC followed by the falling edge of CLK initiates the conversion process synchronously on the next rising edge of CLK.

#### **Table 2. TRUTH TABLE**

|       | Function  |  |  |  |  |  |  |  |  |
|-------|---|--|--|--|--|--|--|--|--|
| Pin   | HIGH  | LOW  |  |  |  |  |  |  |  |
| CKSEL | S <sub>OUT</sub> : PCLK = 8:1<br>CLK: S <sub>OUT</sub> = 1:1<br>CLK / X | S <sub>OUT</sub> : PCLK = 8:1<br>CLK: S <sub>OUT</sub> = 1:2<br>CLK/ |  |  |  |  |  |  |  |
| CKEN  | Synchronously Disables Normal Parallel to Serial Conversion             | Synchronously Enables Normal Parallel to Serial Conversion           |  |  |  |  |  |  |  |
| SYNC  | Asynchronously Resets Internal Flip–Flops*                              | Synchronous Enable   |  |  |  |  |  |  |  |

<sup>\*</sup>The rising edge of SYNC will asynchronously reset the internal circuitry. The falling edge of the SYNC followed by the falling edge of CLK initiates the conversion process synchronously on the next rising edge of CLK.

**Table 3. INPUT VOLTAGE LEVEL SELECTION TABLE** 

| Input Function | Connect To V <sub>CF</sub> Pin |
|----------------|--------------------------------|
| ECL Mode       | V <sub>EF</sub> Pin            |
| CMOS Mode      | No Connect                     |
| TTL Mode*      | 1.5 V ± 100 mV                 |

<sup>\*</sup>For TTL Mode, if no external voltage can be provided, the reference voltage can be provided by connecting the appropriate resistor between  $V_{CF}$  and  $V_{EE}$  pins.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

Input and output parameters vary 1:1 with V<sub>CC</sub>. V<sub>EE</sub> can vary +0.3 V to -2.2 V.
 All loading with 50 Ω to V<sub>CC</sub> - 2.0 V.
 V<sub>IHCMR</sub> min varies 1:1 with V<sub>EE</sub>, V<sub>IHCMR</sub> max varies 1:1 with V<sub>CC</sub>. The V<sub>IHCMR</sub> range is referenced to the most positive side of the differential input signal.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

Input and output parameters vary 1:1 with V<sub>CC</sub>. V<sub>EE</sub> can vary +2.0 V to -0.5 V.
 All loading with 50 Ω to V<sub>CC</sub> - 2.0 V.
 V<sub>IHCMR</sub> min varies 1:1 with V<sub>EE</sub>, V<sub>IHCMR</sub> max varies 1:1 with V<sub>CC</sub>. The V<sub>IHCMR</sub> range is referenced to the most positive side of the differential input signal.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

<sup>14.</sup> Input and output parameters vary 1:1 with  $V_{CC}$ .  $V_{EE}$  can vary +2.0 V to -0.5 V.

<sup>15.</sup> All loading with 50  $\Omega$  to  $V_{CC}$  – 2.0  $V_{CC}$  16.  $V_{IHCMR}$  min varies 1:1 with  $V_{EE}$ ,  $V_{IHCMR}$  max varies 1:1 with  $V_{CC}$ . The  $V_{IHCMR}$  range is referenced to the most positive side of the differential input signal.

<sup>17.</sup> Input and output parameters vary 1:1 with V<sub>CC</sub>.

<sup>18.</sup> All loading with 50  $\Omega$  to  $V_{CC}$  – 2.0 V.

<sup>19.</sup> V<sub>IHCMR</sub> min varies 1:1 with V<sub>EE</sub>, V<sub>IHCMR</sub> max varies 1:1 with V<sub>CC</sub>. The V<sub>IHCMR</sub> range is referenced to the most positive side of the differential input signal.

#### APPLICATION INFORMATION

The MC10/100EP446 is an integrated 8:1 parallel to serial converter. An attribute for EP446 is that the parallel inputs D0–D7 (Pins 17 – 24) can be configured to accept either CMOS, ECL, or TTL level signals by a combination of interconnects between  $V_{EF}$  (Pin 27) and  $V_{CF}$  (Pin 26) pins. For CMOS input levels, leave  $V_{EF}$  and  $V_{CF}$  open. For ECL operation, short  $V_{CF}$  and  $V_{EF}$  (Pins 26 and 27). For TTL operation, connect a 1.5 V supply reference to  $V_{CF}$  and leave the  $V_{EF}$  pin open. The 1.5 V reference voltage to  $V_{CF}$  pin can be accomplished by placing a 1.5 k $\Omega$  or 500  $\Omega$  between  $V_{CF}$  and  $V_{EF}$  for 3.3 V or 5.0 V power supplies, respectively.

Note: all pins requiring ECL voltage inputs must have a 50  $\Omega$  terminating resistor to  $V_{TT}$  ( $V_{TT} = V_{CC} - 2.0 \text{ V}$ ).

The CKSEL input (Pin 2) is provided to enable the user to select the serial data rate output between internal clock data rate or twice the internal clock data rate. For CKSEL LOW operation, the time from when the parallel data is latched 1 to when the data is seen on the  $S_{OUT}$  2 is on the falling edge of the  $7^{th}$  clock cycle plus internal propagation delay (Figure 7). Note the PCLK switches on the falling edge of CLK.

Figure 7. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL LOW

Similarly, for CKSEL HIGH operation, the time from when the parallel data is latched 1 to when the data is seen on the  $S_{OUT}$  2 is on the rising edge of the  $14^{th}$  clock cycle plus internal propagation delay (Figure 8). Furthermore, the PCLK switches on the rising edge of CLK.

Figure 8. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL HIGH

The device also features a differential SYNC input (Pins 29 and 30), which asynchronously reset all internal flip-flops and clock circuitry on the rising edge of SYNC. The release of SYNC is a synchronous process, which ensures that no runt serial data bits are generated. The falling edge of the SYNC followed by a falling edge of CLK initiates the start of the conversion process on the next rising edge of CLK (Figures 9 and 10). As shown in the figures below, the device will start to latch the parallel input data after the a falling edge of SYNC ①, followed by the falling edge CLK ②, on the next rising of edge of CLK ③ for CKSEL LOW

Figure 9. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL LOW and SYNC

Figure 10. Synchronous Release of SYNC for CKSEL LOW

For CKSEL HIGH, as shown in the timing diagrams below, the device will start to latch the parallel input data after the falling edge of SYNC ①, followed by the falling edge CLK ②, on the second rising edge of CLK ③ (Figures 11 and 12).

Figure 11. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL HIGH and SYNC

Figure 12. Synchronous Release of SYNC for CKSEL HIGH

The differential synchronous CKEN inputs (Pins 6 and 7), disable the internal clock circuitry. The synchronous CKEN will suspend all of the device activities and prevent runt pulses from being generated. The rising edge of CKEN followed by the falling edge of CLK will suspend all activities. The falling edge of CKEN followed by the falling edge of CLK will resume all activities (Figure 13).

Figure 13. Timing Diagram with CKEN with CKSEL HIGH

The differential PCLK output (Pins 14 and 15) is a word framer and can help the user synchronize the serial data output, S<sub>OUT</sub> (Pins 11 and 12), in their applications. Furthermore, PCLK can be used as a trigger for input parallel data (Figure 14).

An internally generated voltage supply, the  $V_{BB}$  pin, is available to this device only. For single-ended input

conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a 0.01  $\mu F$  capacitor and limit current sourcing or sinking to 0.5 mA. When not used,  $V_{BB}$  should be left open. Also, both outputs of the differential pair must be terminated (50  $\Omega$  to  $V_{TT}$ ) even if only one output is used.
