# No High-Voltage Bias, Low Harmonic Distortion, 32-Channel, High-Voltage Analog Switch 

## Features

- 32-Channel (16 2:1 MUX) High-Voltage Analog Switch
- Only +5 V Bias Supply Required
- 3.3V and 5V CMOS Input Logic Level
- Asymmetric Switch Topology for Small Size
- 66 MHz Data Shift Clock Frequency
- Low-Parasitic Capacitance
- Low Harmonic Distortion
- DC to 50 MHz Analog Small-Signal Frequency
- 200 kHz to 50 MHz Large Signal Frequency
- -70 dB Typical Off Isolation at 5.0 MHz
- Excellent Noise Immunity
- Cascadable Serial Data Register with Latches
- Integrated Bleed Resistors on the SW Outputs (HV2918 only)

## Applications

- Medical Ultrasound Imaging
- Non-Destructive Testing (NDT) Metal Flaw Detection
- Piezoelectric Transducer Drivers
- Inkjet Printer Head
- Optical MEMS Modules

## General Description

The HV2818/HV2918 devices are low harmonic distortion, low charge injection, 16 2:1 multiplexer/demultiplexer, high-voltage analog switches without high-voltage bias supplies. They are intended for use in applications requiring high-voltage switching controlled by low-voltage control signals, such as medical ultrasound imaging, driving piezoelectric transducers and printers.
The HV2818/HV2918 are pin-to-pin compatible to high-voltage bias HV2801/HV2901, except for bias voltage pins. The HV2818/HV2918 are available in a 64 -pin, $9 x 9 \mathrm{~mm}$ QFN package. The devices have asymmetric topology to implement a small size in low voltage bias high-voltage switches while keeping performance such as peak current. The SW pin can pass high-voltage pulsed signals when the switch is ON. During the OFF state, high-voltage must not be applied to the SW pin due to its asymmetric topology. In medical ultrasound systems, the $Y$ pin must be connected to the analog front end (AFE) and the SW pin must be connected to a single piezoelectric transducer element to avoid high voltage in the SW pin during the switch OFF state.
HV2818 and HV2918 are identical, except for the bleed resistors at the SW pins. HV2818 does not have the bleed resistors at the SW pins like HV2801. HV2918 has the bleed resistors at the SW pins like HV2901. The bleed resistors eliminate possible voltage build-up on capacitive loads such as piezoelectric transducers. The ON/OFF state of the 32 switches is programmed individually through a digital serial interface.
The devices only need a +5 V low-voltage bias supply. However, all of the analog switches can pass up to $\pm 100 \mathrm{~V}$ high-voltage pulsed signals. Like other low-voltage bias switches, the HV2818/HV2918 cannot pass high-voltage DC signals. They can only pass highvoltage pulsed signals up to $2.5 \mu$ s pulse width. These devices have typical $6 \Omega$ ON resistance and 50 MHz bandwidth for small signals.

## HV2818/HV2918

## Package Type

## Functional Block Diagram

### 1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings $\dagger$
Logic Supply Voltage ( $\mathrm{V}_{\mathrm{LL}}$ ) -0.5 V to 6.6 V
Positive Supply Voltage ( $\mathrm{V}_{\mathrm{DD}}$ ). -0.5 V to 6.6 V
Logic Input Voltage ( $\mathrm{V}_{\mathrm{IN}}$ ). -0.5 V to $\mathrm{V}_{\mathrm{LL}}+0.3 \mathrm{~V}$
Analog Signal Voltage Y Pin $\left(V_{Y}\right)$ -110 V to +110 V
Analog Signal Voltage SW Pin $\left(\mathrm{V}_{\mathrm{SW}}\right)$ when the Switch is ON ................................................................-110V to +110 V
Analog Signal Voltage SW Pin (VSW) when the Switch is OFF ...................................................................... -2 V to +2 V
Peak Analog Signal Current/Channel (lPK) ...............................................................................................................2.7A
$\dagger$ Notice: Stresses above those listed under Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

Note: Devices are ESD-sensitive. Handling precautions are recommended.

## RECOMMENDED OPERATING CONDITIONS

| Parameters | Sym. | Min. | Typ. | Max. | Units | Conditions |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Logic Supply Voltage | $\mathrm{V}_{\mathrm{LL}}$ | 3 | - | 5.5 | V | - |
| Positive Supply Voltage | $\mathrm{V}_{\mathrm{DD}}$ | 4.5 | - | 6.3 | V | - |
| Analog Signal Voltage Y Pin Peak-to-Peak | $\mathrm{V}_{\mathrm{Y}}$ | -100 | - | 100 | V | - |
| High-Level Input Voltage | $\mathrm{V}_{\mathrm{IH}}$ | $0.9 \mathrm{~V}_{\mathrm{LL}}$ | - | $\mathrm{V}_{\mathrm{LL}}$ | V | - |
| Low-Level Input Voltage | $\mathrm{V}_{\mathrm{IL}}$ | 0 | - | $0.1 \mathrm{~V}_{\mathrm{LL}}$ | V | - |

Note 1: Power-up sequence is $\mathrm{V}_{\mathrm{LL}}$ first and then $\mathrm{V}_{\mathrm{DD}}$. Power-down sequence is the reverse of power-up.
2: $V_{Y}$ and $V_{S W}$ must be within $V_{D D}$ and GND or floating during power-up/down transition.
3: Rise and fall times of power supplies, $\mathrm{V}_{\mathrm{LL}}$ and $\mathrm{V}_{\mathrm{DD}}$ must be greater than 1.0 ms .

## DC ELECTRICAL CHARACTERISTICS

Unless otherwise specified, $\mathrm{V}_{\mathrm{DD}}=+5 \mathrm{~V}, \mathrm{~V}_{\mathrm{LL}}=+5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$. Boldface specifications apply over the full operating temperature range.

| Parameters | Sym. | Min. | Typ. | Max. | Units | Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Small-Signal Switch On-Resistance | $\mathrm{R}_{\text {ONS }}$ | - | 6 | 9 | $\Omega$ | $\mathrm{I}_{\text {SIG }}=5 \mathrm{~mA}$ |
|  |  | - | 6 | 9 | $\Omega$ | $\mathrm{I}_{\text {SIG }}=200 \mathrm{~mA}$ |
| Small Signal Switch On-Resistance Matching | $\Delta \mathrm{R}_{\text {ONS }}$ | - | - | 20 | \% | $\mathrm{I}_{\text {SIG }}=5 \mathrm{~mA}$ |
| Large-Signal Switch ON-Resistance | $\mathrm{R}_{\text {ONL }}$ | - | 5 | - | $\Omega$ | $\begin{aligned} & \mathrm{V}_{\text {SIG }}=90 \mathrm{~V}, \mathrm{R}_{\text {LOAD }}=80 \Omega \\ & \text { (Note 1) } \end{aligned}$ |
| Value of Output Bleed Resistor (HV2918 only) | $\mathrm{R}_{\text {INT }}$ | 20 | 35 | 50 | k $\Omega$ | Output switch to $\mathrm{R}_{\mathrm{GND}}$ $\mathrm{I}_{\mathrm{RINT}}=20 \mu \mathrm{~A}$ |
| Switch Off Leakage per SW Pin | $\mathrm{I}_{\text {SOL }}$ | - | - | 3 | $\mu \mathrm{A}$ | $\mathrm{V}_{\text {SIG }}=+100 \mathrm{~V}, 500 \mu$ s pulse, see Figure 3-1 |
|  |  | - | - | 3 | $\mu \mathrm{A}$ | $\mathrm{V}_{\text {SIG }}=-100 \mathrm{~V}, 100 \mu \mathrm{~s}$ pulse, see Figure 3-1 (Note 1) |

Note 1: Specification is obtained by characterization and is not $100 \%$ tested.
2: Design guidance only.

## DC ELECTRICAL CHARACTERISTICS (CONTINUED)

Unless otherwise specified, $\mathrm{V}_{\mathrm{DD}}=+5 \mathrm{~V}, \mathrm{~V}_{\mathrm{LL}}=+5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$. Boldface specifications apply over the full operating temperature range.

| Parameters | Sym. | Min. | Typ. | Max. | Units | Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Switch Off Bias per Y Pin | $I_{\text {SOB }}$ | - | - | 3 | $\mu \mathrm{A}$ | $\mathrm{V}_{\mathrm{SIG}}=+100 \mathrm{~V}, 500 \mu \mathrm{~s}$ pulse, see Figure 3-2 |
|  |  | - | - | 3 | mA | $\mathrm{V}_{\text {SIG }}=-100 \mathrm{~V}, 100 \mu$ s pulse, see Figure 3-2 (Note 1) |
|  |  | HV2818 |  |  |  |  |
| Switch Off Bias per SW Pin |  | - | - | 3 | $\mu \mathrm{A}$ | $\begin{aligned} & \mathrm{V}_{\text {SIG }}=+300 \mathrm{mV},-300 \mathrm{mV} \\ & \text { see Figure } 3-3 \end{aligned}$ |
|  |  | HV2918 |  |  |  |  |
| Switch Off Bias of All SW Pins |  | - | - | 10 | $\mu \mathrm{A}$ | $\begin{aligned} & \mathrm{V}_{\text {SIG }}=+300 \mathrm{mV},-300 \mathrm{mV} \text {, } \\ & \text { see Figure 3-3 } \end{aligned}$ |
| DC Offset Switch Off | $\mathrm{V}_{\mathrm{OS}}$ | - | 1 | 10 | mV | $R_{\text {LOAD }}=50 \mathrm{k} \Omega$ (HV2818), No load (HV2918) See Figure 3-4 |
| DC Offset Switch On |  | - | 1 | 10 |  |  |
| Quiescent $\mathrm{V}_{\mathrm{DD}}$ Supply Current | $\mathrm{I}_{\mathrm{DDQ}}$ | - | - | 10 | $\mu \mathrm{A}$ | All switches OFF |
|  |  | - | - | 10 | $\mu \mathrm{A}$ | All switches $\mathrm{ON}, \mathrm{V}_{\text {SW }}=1 \mathrm{~V}$ |
| Quiescent $\mathrm{V}_{\mathrm{LL}}$ Supply Current | ILLQ | - | - | 10 | $\mu \mathrm{A}$ | All logic inputs are static |
| Switch Output Peak Current | $\mathrm{I}_{\text {SW }}$ | 2 | 2.7 | - | A | $\mathrm{V}_{\text {SIG }}$ duty cycle $<0.1 \%$ (Note 1) |
| Output Switching Frequency | $\mathrm{f}_{\text {SW }}$ | - | - | 50 | kHz | Duty cycle = 50\% (Note 1) |
| Average $\mathrm{V}_{\text {DD }}$ Supply Current | $I_{\text {DD }}$ | - | 7 | 10 | mA | All output switches are turning ON and OFF at 50 kHz with no load |
| Average $\mathrm{V}_{\text {LL }}$ Supply Current | $\mathrm{I}_{\mathrm{LL}}$ | - | 1.3 | 2.5 | mA | $\mathrm{f}_{\text {CLK }}=5.0 \mathrm{MHz}$ |
| Data Out Source Current | $\mathrm{I}_{\text {SOR }}$ | 10 | - | - | mA | $\mathrm{V}_{\text {OUT }}=\mathrm{V}_{\mathrm{LL}}-0.7 \mathrm{~V}$ |
| Data Out Sink Current | $\mathrm{I}_{\text {SINK }}$ | 10 | - | - | mA | $\mathrm{V}_{\text {OUT }}=0.7 \mathrm{~V}$ |
| Logic Input Capacitance | $\mathrm{C}_{\text {IN }}$ | - | 8 | - | pF | Note 2 |

Note 1: Specification is obtained by characterization and is not $100 \%$ tested.
2: Design guidance only.

## AC ELECTRICAL CHARACTERISTICS

Unless otherwise specified, $\mathrm{V}_{\mathrm{DD}}=+5 \mathrm{~V}, \mathrm{~V}_{\mathrm{LL}}=+5 \mathrm{~V}, \mathrm{~T}_{\mathrm{AMB}}=+25^{\circ} \mathrm{C}$. Boldface specifications apply over the full operating temperature range.

| Parameters | Sym, | Min. | Typ. | Max. | Units. | Conditions |
| :--- | :---: | :---: | :---: | :---: | :---: | :--- |
| Setup Time before LE Rises | $\mathrm{t}_{\mathrm{SD}}$ | $\mathbf{2 5}$ | - | - | ns | Note 1 |

Note 1: The 32 switches operate independently.
2: Serial data are clocked in on the L to H transition of the CLK.
3: All 32 switches go to a state retaining their latched condition at the rising edge of $\overline{\mathrm{LE}}$. When $\overline{\mathrm{LE}}$ is low the shift registers data flow through the latch.
4: $D_{\text {Out }}$ is high when data in register 31 are high.
5: Shift register clocking has no effect on the switch states if $\overline{\mathrm{LE}}$ is high.
6: The CLR (clear) input overrides all the inputs.

### 1.1 Typical Timing Diagram

Figure 1-1 shows the timing of the AC characteristic parameters graphically.

FIGURE 1-1: Logic Input Timing Diagram.

NOTES:

### 2.0 PIN DESCRIPTIONS

This section details the pin descriptions for the 64-Lead QFN package (Figure 2-1). The descriptions of the pins are listed in Table 2-1.

- The central thermal pad on the bottom of package must be connected to GND externally.

FIGURE 2-1: 64-Lead QFN Package - Top View.

### 4.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated: $\mathrm{V}_{\mathrm{DD}}=+5 \mathrm{~V}, \mathrm{~V}_{\mathrm{LL}}=+5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$.

NOTES:

### 5.0 DETAILED DESCRIPTION AND APPLICATION INFORMATION

### 5.1 Device Overview

The HV2818/HV2918 devices are 200V, low harmonic distortion, low charge injection, 32-channel (16 2:1 multiplexer/demultiplexer), high-voltage analog switches without high-voltage supplies. The devices require only +5 V bias voltage for operation. The highvoltage analog switches are used for multiplexing a piezoelectric transducer array in a probe to multiple channel transmitter (Tx) arrays in a medical ultrasound system.
The HV2818/HV2918 are distinguished by bleed resistors that eliminate voltage build-up in capacitance loads such as piezoelectric transducers. These devices can pass $\pm 100 \mathrm{~V}$ high-voltage pulsed signal without high-voltage bias supplies such as $\pm 100 \mathrm{~V}$. These devices have typical $6 \Omega$ ON resistance and 50 MHz bandwidth for small signals.

Like other low voltage bias switches, the HV2818/HV2918 cannot pass high-voltage DC signals. They can only pass high-voltage pulsed signals up to $2.5 \mu$ s pulse width.
The HV2818/HV2918 have asymmetric topology to implement smaller size compared to previous low voltage bias high-voltage switches. The SW pin can pass a high-voltage pulsed signal applied to the Y pin when the switch is ON state. When the switch is OFF state, high-voltage signal must not be applied to the SW pin due to the asymmetric topology. In medical ultrasound systems, the $Y$ pin must be connected to AFE and the SW pin must be connected to only one piezoelectric transducer element to avoid high voltage at the SW pin during switch OFF state in the system.

Figure 5-1 shows a typical medical ultrasound image system consisting of 64 channels of transmit pulsers ( Tx ), 64 channels of receivers ( Rx and ADC) and 64 channels of T/R switches connecting to 256 elements of an ultrasound probe via the HV2XXX high-voltage analog switch array.

FIGURE 5-1: $\quad$ Typical Medical Ultrasound Imaging System.

### 5.2 Logic Input Timing

The HV2818/HV2918 have a digital serial interface consisting of Data In ( $\mathrm{D}_{\mathrm{IN}}$ ), Clock (CLK), Data Out ( $\mathrm{D}_{\text {OUt }}$ ), Latch Enable ( $\overline{\mathrm{LE}}$ ) and Clear (CLR) to control 32 switches independently. The digital circuits are supplied by $\mathrm{V}_{\mathrm{LL}}$. The serial clock frequency is up to 66 MHz .

The switch state configuration data, 32 -bit $\mathrm{D}_{\mathrm{IN}}$, are shifted into the 32 shift registers on the rising edge (low-to-high transition) of the clock. The $\mathrm{D}_{\mathrm{OUT}}$ has the same logic state of the $31^{\text {st }}$ shift register data. The switch Configuration bit of SW31 is shifted in first and the Configuration bit of SWO is shifted in last. To change all the switch ON/OFF states at the same time, the LE must remain high while the 32-bit Data In signal is shifted into the 32-bit register.

## HV2818/HV2918

After the valid 32-bit data complete shifting into the shift registers, the high-to-low transition of the $\overline{\mathrm{LE}}$ signal transfers the contents of the shift registers into the latches. Finally, setting the $\overline{\mathrm{LE}}$ back to high allows all the latches to keep the current state while new data can be shifted into the shift registers without disturbing the latches.
It is recommended to change all the latch states at the same time through this method to avoid possible clock feed through noise (see Figure 5-2 for details).

When the CLR input is set high, it resets the data of all 32 latches to low. Consequently, all the high-voltage switches are set to OFF state. However, the CLR signal does not affect the contents of the shift register, so the shift register can operate independently of the CLR signal. Therefore, the shift register still retains the previous data when the CLR input is low (see Table 11 for details).

FIGURE 5-2: Latch Enable Timing Diagram.

### 5.3 Multiple Devices Connection

The digital serial interface of the HV2818/HV2918 allows multiple devices to daisy-chain architecture. In daisy-chain architecture, $D_{\text {OUT }}$ of the first device is connected to the $\mathrm{D}_{\text {IN }}$ of the second device, and so forth. The last $\mathrm{D}_{\text {OUT }}$ of the daisy-chained HV2818/HV2918 can be either floating or fed back to an FPGA to check the previously stored shift register data. CLK, CLR and $\overline{\mathrm{LE}}$ of daisy-chained devices can be connected to each other to save the number of control signal from FPGA.
To control all the high-voltage analog switch states in daisy-chained N devices, Nx 32 bits of data are shifted into shift registers along with Nx32 clocks, while $\overline{\mathrm{LE}}$ remains high and CLR remains low. After all the data finish shifting in, one single negative pulse of $\overline{\mathrm{LE}}$ transfers the data from shift registers to latches simultaneously. Consequently, all Nx32 high-voltage analog switches change states simultaneously.

### 5.4 Power-Up/Down Sequence

The recommended power-up sequence of the HV2818/HV2918 is $\mathrm{V}_{\mathrm{LL}}$ first then $\mathrm{V}_{\mathrm{DD}}$. The powerdown sequence is in reverse order of power-up. During the power-up/down period, all the analog switch inputs must be within $\mathrm{V}_{\mathrm{DD}}$ and GND or floating.

### 5.5 Layout Considerations

The HV2818/HV2918 devices have two separate ground connections. DGND is the ground connection for digital circuitry, and GND is the ground connection for substrate and analog switches. High-transient current passes though the switches and returns through GND in the ultrasound system. The high-current path needs to be designed as short as possible to avoid ground bouncing.

It is recommended to use two separate ground planes in the PCB, connected together at the return terminal of the input power line, as shown in Figure 5-3. It is recommended that $0.1 \mu \mathrm{~F}$ or larger ceramic decoupling capacitors, with low Equivalent Series Resistance (ESR) and appropriate voltage rating, be connected between DGND and power supplies, $\mathrm{V}_{\mathrm{LL}}$ and $\mathrm{V}_{\mathrm{DD}}$. These decoupling capacitors must be placed as close as possible to the device in the PCB layout.

FIGURE 5-3: Layout Guidelines.

NOTES:

### 6.0 PACKAGING INFORMATION

### 6.1 Package Marking Information

64-Lead QFN ( $9 \times 9 \times 0.9 \mathrm{~mm}$ )

Legend: $X X$...X Product Code or Customer-specific information $Y \quad$ Year code (last digit of calendar year)
YY Year code (last 2 digits of calendar year)
WW Week code (week of January 1 is week ' 01 ')
NNN Alphanumeric traceability code
(e3) Pb-free JEDEC designator for Matte Tin (Sn)

* This package is Pb -free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.

64-Lead Very Thin Plastic Quad Flat, No Lead Package (R4X) - 9x9x0.9 mm Body [VQFN]
With $7.15 \times 7.15$ Exposed Pad [Also called QFN]
Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
2. For best soldering results, thermal vias, if used, should be filled or tented to avoid solder loss during reflow process

## APPENDIX A: REVISION HISTORY

## Revision B (August 2021)

The following is the list of modifications:

- Updated Note 1 in table Recommended Operating Conditions.
- Updated parameter "Off Isolation SW to Y" in table AC Electrical Characteristics.
- Various typographical errors.

## Revision A (June 2020)

- Initial release of this document.

NOTES:

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

NOTES:

## Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication is provided for the sole purpose of designing with and using Microchip products. Information regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.
