MAX32520FTHR Evaluation Kit

Evaluates: MAX32520

General Description

The MAX32520FTHR evaluation kit provides an inexpensive and convenient platform for evaluating the MAX32520 secure Arm® Cortex®-M4 processor with FPU that incorporates Maxim's patented ChipDNA™ PUF technology and other security features. The featherwing form factor and USB connectivity enable rapid prototyping and firmware development.

EV Kit Contents

- MAX32520FTHR circuit board
- MAX326325PICO JTAG debugger/programmer
- USB cable

Features

- Featherwing Form Factor for General Hardware Prototyping
- PMOD Connector for Interface with PMOD-Compatible Peripherals
- USB Controller for High-Speed Data Transfer with a PC Host
- SWD Port for Programming and Debugging

Ordering Information appears at end of data sheet.

MAX32520FTHR EV Block Diagram

Detailed Description

The MAX32520FTHR EV kit is designed to support low-cost rapid prototyping with the MAX32520 DeepCover® ChipDNA™ secure Arm Cortex-M4 processor with FPU. For a full-featured evaluation platform, refer to the MAX32520 evaluation kit.

A quad-SPI (QSPI) bus connects the MCU to the host through a high-speed USB-to-QSPI bridge chip, the FTDI DT4222H. This facilitates easy experimentation with the high-speed QSPI and I²C busses on the MAX32520 and

support applications such as secure boot, hardware-accelerated cryptography, and secure dongle applications. The kit also features a 10-pin SWD Arm JTAG header that can be used with the included debugger, the MAX32625PICO, to flash and debug firmware.

Example firmware is available on the design resources tab of the MAX32520FTHR product page on the Maxim website. Maxim’s Low-Power Arm Micro Toolchain is required to develop and flash firmware.
