# TAS5805M 23-W, Inductor-Less, Digital Input, Stereo, Closed-Loop Class-D Audio Amplifier with Enhanced Processing and Low Power Dissipation 

## 1 Features

- Supports Multiple Output Configurations
- $2 \times 23 \mathrm{~W}$ in 2.0 Mode ( $8-\Omega, 21 \mathrm{~V}, \mathrm{THD}+\mathrm{N}=1 \%$ )
- 45 W in Mono Mode (4- $\Omega, 21 \mathrm{~V}, \mathrm{THD}+\mathrm{N}=1 \%$ )
- Excellent Audio Performance
- THD $+\mathrm{N} \leq 0.03 \%$ at $1 \mathrm{~W}, 1 \mathrm{kHz}, \mathrm{PVDD}=12 \mathrm{~V}$
- $\operatorname{SNR} \geq 107 \mathrm{~dB}$ (A-weighted), Noise Level < 40 $\mu \mathrm{V}_{\mathrm{RMS}}$
- Low Quiescent Current with Hybrid Modulation
-16.5 mA at $\mathrm{PVDD}=13.5 \mathrm{~V}, 22 \mu \mathrm{H}+0.68 \mu \mathrm{~F}$ Filter
- Flexible Power Supply Configurations
- PVDD: 4.5 V to 26.4 V
- DVDD and I/O: 1.8 V or 3.3 V
- Flexible Audio I/O
- I²S, LJ, RJ, TDM, 3-Wire Digital Audio Interface (No MCLK Required)
- Supports 32, 44.1, 48, 88.2, 96 kHz Sample Rates
- SDOUT for Audio Monitoring, Sub-Channel or Echo Cancellation
- Enhanced Audio Processing
- Multi-Band Advanced DRC and AGL
- $2 \times 15 \mathrm{BQs}$
- Thermal Foldback, DC Blocking
- Input Mixer, Output Crossbar
- Level Meter
- 5 BQs + 1 Band DRC +THD Manager for the Subwoofer Channel
- Sound Field Spatializer option
- Integrated Self-Protection
- Adjacent Pin to Pin Short Without Damage
- Over-Current Error (OCE)
- Over-Temperature Warning (OTW)
- Over-Temperature Error (OTE)
- Under/Over-Voltage Lock-out (UVLO/OVLO)
- Easy System Integration
- $I^{2} C$ Software Control
- Reduced Solution Size
- Fewer Passives Required Compared to Open-Loop Devices
- Inductor-less Operation (Ferrite Bead) for most cases where PVDD $\leq 14 \mathrm{~V}$
- Wireless Speaker, Smart Speaker with Voice Assistant
- Soundbar, Wired Speaker, Bookshelf Stereo System
- Desktop PC, Notebook PC
- AV Receiver, Smart Home and IoT Appliance

## 3 Description

The TAS5805M is a high-efficiency, stereo, closedloop Class-D amplifier offering a cost-effective digitalinput solution with low power dissipation and sound enrichment. The device's integrated audio processor and 96 kHz architecture support advanced audio process flow, including SRC, 15 BQs per channel, volume control, audio mixing, 3-band 4th order DRC, full-band AGL, THD manager and level meter.

Featuring Tl's proprietary Hybrid Modulation scheme, the TAS5805M consumes very-low quiescent current ( 16.5 mA at 13.5 V PVDD), extending battery life in portable audio applications. With advanced EMI suppression technology, designers can leverage inexpensive ferrite bead filters to reduce board space and system cost.

## Device Information

| PART NUMBER | PACKAGE ${ }^{(1)}$ | BODY SIZE (NOM) |
| :--- | :---: | :---: |
| TAS5805M | TSSOP (28) PWP | $9.7 \mathrm{~mm} \times 4.4 \mathrm{~mm}$ |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Simplified Block Diagram

## 2 Applications

- LCD TV, OLED TV

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.
Changes from Revision C (December 2018) to Revision D (November 2020) ..... Page

- Added note 1 to the Recommended Operating Conditions ..... 7
- Added capacitve load for each bus line, $\mathrm{Cb}=400 \mathrm{pf}$ to the I2C timming parameters in the Timing Requirements ..... 11
- Change the I2C BUS Timming-Standard. Data Hold Time max value from 900 ns to 3450 ns in the Timing Requirements ..... 11
- Added efficiency plot and $1 \% / 10 \%$ THD+N output power vs PVDD plot for $4-\Omega$ load ..... 12
- Added notes the Hybrid Modulation section. ..... 40
- Added Speaker DC Protection, Device Over Temperature Protection, Device Over Voltage/Under Voltage Protection, and Clock Fault sections ..... 46
Changes from Revision B (October 2018) to Revision C (December 2018) Page
- Added Figure 7-14 ..... 45
- Added Figure 7-15 ..... 45
Changes from Revision A (July 2018) to Revision B (October 2018) ..... Page
- Changed From: (<16.5 mA at 13.5 V PVDD) To:( 16.5 mA at 13.5 V PVDD) in the Description ..... 1
- Changed the Typical Characteristics graphs ..... 12
- Added the Clock Halt Auto-recover section ..... 31
- Added the Sample Rate on the Fly Change section. ..... 31
- Added the Thermal Foldback section. ..... 37
- Changed the Device State Control section ..... 37
- Changed the DSP Memory Book, Page and BQ Coefficients Update section ..... 43
- Added the Example Use section ..... 43
- Deleted 010:310K in Table 7-9 ..... 47
- Added the Inductor Selections section ..... 81
- Added the Step 2: Speaker Tuning section. ..... 86
- Changed the Development Support section.
Changes from Revision * (May 2018) to Revision A (July 2018) ..... Page
- Released as Production Data ..... 1

## 5 Pin Configuration and Functions

Figure 5-1. PWP Package, 28-Pin TSSOP,
Table 5-1. Pin Functions

| PIN |  | TYPE ${ }^{(1)}$ | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| DGND | 1,5 | P | Digital ground |
| DVDD | 2 | P | 3.3-V or 1.8-V digital power supply |
| VR_DIG | 4 | P | Internally regulated 1.5-V digital supply voltage. This pin must not be used to drive external devices |
| ADR/ FAULT | 3 | DI/O | Different $I^{2} \mathrm{C}$ device address can be set by selecting different pull up resistor to DVDD, see Table 7-5 for details. After power up, ADR/ FAULT can be redefine as FAULT, go to Page0, Book0, set register 0x61 $=0 \times 0 \mathrm{~b}$ first, then set register $0 \times 60=0 \times 01$ |
| LRCLK | 6 | DI | Word select clock for the digital signal that is active on the serial port's input data line. In $\mathrm{I}^{2} \mathrm{~S}$, LJ and RJ , this corresponds to the left channel and right channel boundary. In TDM mode, this corresponds to the frame sync boundary |
| SCLK | 7 | DI | Bit clock for the digital signal that is active on the input data line of the serial data port. |
| SDIN | 8 | DI | Data line to the serial data port |
| SDOUT | 9 | DO | Serial Audio data output. The source data can be Pre-DSP or Post-DSP data, by setting the register 0x30h. |
| SDA | 10 | DI/O | I2C serial control data interface input/output |
| SCL | 11 | DI | I2C serial control clock input |
| $\overline{\text { PDN }}$ | 12 | DI | Power Down, active-low. $\overline{\text { PDN }}$ place the amplifier in Shutdown, turn off all internal regulators. Low, Power Down Device; High, Enable Device. |
| AVDD | 13 | P | Internally regulated 5-V analog supply voltage. This pin must not be used to drive external devices |
| AGND | 14 | P | Analog ground |
| PVDD | $\begin{gathered} \hline 15,16,27 \\ 28 \end{gathered}$ | P | PVDD voltage input |
| PGND | 19,24 | P | Ground reference for power device circuitry. Connect this pin to system ground. |
| OUT_A+ | 26 | 0 | Positive pin for differential speaker amplifier output A+ |
| BST_A+ | 25 | P | Connection point for the OUT_A+ bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_A+ |
| OUT_A- | 23 | 0 | Negative pin for differential speaker amplifier output A- |

Table 5-1. Pin Functions (continued)

| PIN |  | TYPE ${ }^{(1)}$ |  |
| :--- | :---: | :---: | :--- |
| NAME | NO. |  | DESCRIPTION |
| BST_A- | 22 | P | Connection point for the OUT_A- bootstrap capacitor which is used to create a power supply for the high-side gate <br> drive for OUT_A- |
| BST_B- | 21 | P | Connection point for the OUT_B- bootstrap capacitor which is used to create a power supply for the high-side gate <br> drive for OUT_B- |
| OUT_B- | 20 | O | Negative pin for differential speaker amplifier output B |
| BST_B+ $^{\text {O }}$ | 18 | P | Connection point for the OUT_B+ bootstrap capacitor which is used to create a power supply for the high-side <br> gate drive for OUT_B+ |
| OUT_B+ | 17 | O | Positive pin for differential speaker amplifier output B+ |
| PowerPAD ${ }^{\text {TM }}$ |  | P | Connect to the system Ground |

(1) $\mathrm{AI}=$ Analog input, $\mathrm{AO}=$ Analog output, $\mathrm{DI}=$ Digital Input, $\mathrm{DO}=$ Digital Output, $\mathrm{DI} / \mathrm{O}=$ Digital Bi-directional (input and output), $\mathrm{P}=$ Power, $G=$ Ground ( 0 V )

TAS5805M

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Free-air room temperature $25^{\circ} \mathrm{C}$ (unless otherwise noted) ( ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| DVDD | Low-voltage digital supply | -0.3 | 3.9 | V |
| PVDD | PVDD supply | -0.3 | 30 | V |
| $V_{\text {I(Digln) }}$ | DVDD referenced digital inputs ${ }^{(2)}$ | -0.5 | $\mathrm{V}_{\text {DVDD }}+0.5$ | V |
| $\mathrm{V}_{\text {I(SPK_OUTxx) }}$ | Voltage at speaker output pins | -0.3 | 32 | V |
| $\mathrm{T}_{\text {A }}$ | Ambient operating temperature | -25 | 85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature | -40 | 125 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) DVDD referenced digital pins include: ADR/ FAULT, LRCLK, SCLK, SCL, SDA, SDIN, PDN

### 6.2 ESD Ratings

|  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | $\pm 2000$ |  |
| $V_{\text {(ESD) }}$ | Electrostatic discharge | Charged-device model (CDM), per JEDEC specification JESD22C101 ${ }^{(2)}$ | $\pm 500$ | V |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) see ${ }^{(1)}$

|  |  |  | MIN | NOM | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | DVDD | 1.62 |  | 3.63 |  |
|  |  | PVDD | 4.5 |  | 26.4 |  |
| $\mathrm{R}_{\text {SPK }}$ | Minimum speaker load | BTL Mode (4.5V $\leq P V D D \leq 26.4 \mathrm{~V}$ ) | VOUT $_{\text {PEAK }} / O C E$ <br> thres | 6 |  | $\Omega$ |
| $\mathrm{R}_{\text {SPK }}$ | Minimum speaker load | PBTL Mode (4.5V $\leq$ PVDD $\leq 26.4 \mathrm{~V}$ ) | VOUT PEAK $\left(2 \times \text { OCE }_{\text {THRES }}\right)$ | 4 |  | $\Omega$ |
| Lout | Minimum inductor value in LC filter under short-circuit condition |  | 1 | 4.7 |  | $\mu \mathrm{H}$ |

(1) The minimal speaker load been limited by OCE Threshold, if output peak current <5A, TAS5805M also supports lower speaker load with High PVDD. For BTL, the OCE Threshold is 5A (Typical); For PBTL, the OCE Threshold is 10A (Typical). The minimal speaker load depends on the output peak voltage.

### 6.4 Thermal Information

| THERMAL METRIC ${ }^{(1)}$ |  | $\begin{gathered} \text { TAS5805M } \\ \text { TSSOP (PWP) } \\ 28 \text { PINS } \\ \hline \end{gathered}$ |  |  | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{gathered} \text { JEDEC } \\ \text { STANDARD } \\ \text { 2-LAYER PCB } \end{gathered}$ | JEDEC STANDARD 4-LAYER PCB | TAS5805MEVM-4 4-LAYER PCB |  |
| $\mathrm{R}_{\text {өJA }}$ | Junction-to-ambient thermal resistance | N/A | 29.1 | 24 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case (top) thermal resistance | N/A | 21.8 | N/A | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance | N/A | 8.2 | N/A | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JT }}$ | Junction-to-top characterization parameter | N/A | 0.3 | 1.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JB }}$ | Junction-to-board characterization parameter | N/A | 8.1 | 7.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case (bottom) thermal resistance | N/A | 2.2 | N/A | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

### 6.5 Electrical Characteristics

Free-air room temperature $25^{\circ} \mathrm{C}$ (unless otherwise noted)

| PARAMETER |  | TEST CONDITIONS | MIN | TYP MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DIGITAL I/O |  |  |  |  |  |
| \|IIH| | Input logic high current level for DVDD referenced digital input pins | $\mathrm{V}_{\operatorname{IN}(\mathrm{DigIn})}=\mathrm{V}_{\text {DVDD }}$ |  | 10 | $\mu \mathrm{A}$ |
| \|IILI | Input logic low current level for DVDD referenced digital input pins | $\mathrm{V}_{\operatorname{IN}(\mathrm{Digln})}=0 \mathrm{~V}$ |  | -10 | $\mu \mathrm{A}$ |
| $\mathrm{V}_{1 H(\text { Digin })}$ | Input logic high threshold for DVDD referenced digital inputs |  | 70\% |  | $\mathrm{V}_{\text {DVDD }}$ |
| $\mathrm{V}_{\text {IL(Digin) }}$ | Input logic low threshold for DVDD referenced digital inputs |  |  | 30\% | $\mathrm{V}_{\text {DVDD }}$ |
| $\mathrm{V}_{\mathrm{OH}(\text { Digin })}$ | Output logic high voltage level | $\mathrm{IOH}=2 \mathrm{~mA}$ | 80\% |  | $\mathrm{V}_{\text {DVDD }}$ |
| $\mathrm{V}_{\text {OL( }}$ (igin) | Output logic low voltage level | $\mathrm{I}_{\mathrm{OH}}=-2 \mathrm{~mA}$ |  | 20\% | $\mathrm{V}_{\text {DVDD }}$ |
| $1^{2} \mathrm{C}$ CONTROL PORT |  |  |  |  |  |
| $\mathrm{C}_{\mathrm{L}(12 \mathrm{C})}$ | Allowable load capacitance for each $I^{2} \mathrm{C}$ line |  |  | 400 | pF |
| $\mathrm{fSCL}_{\text {(fast) }}$ | Support SCL frequency | No wait states, fast mode |  | 400 | kHz |
| $\mathrm{f}_{\text {SCL }}$ (slow) | Support SCL frequency | No wait states, slow mode |  | 100 | kHz |

## SERIAL AUDIO PORT

| $t_{\text {DLY }}$ | Required LRCLK/FS to SCLK rising edge delay |  | 5 |  | ns |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{D}_{\text {SCLK }}$ | Allowable SCLK duty cycle |  | 40\% | 60\% |  |
| $\mathrm{f}_{\mathrm{S}}$ | Supported input sample rates |  | 32 | 96 | kHz |
| $\mathrm{f}_{\text {SCLK }}$ | Supported SCLK frequencies |  | 32 | 64 | $\mathrm{f}_{\mathrm{S}}$ |
| $\mathrm{f}_{\text {SCLK }}$ | SCLK frequency |  |  | 24.576 | MHz |
| SPEAKER AMPLIFIER (ALL OUTPUT CONFIGURATIONS) |  |  |  |  |  |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on DVDD | $\overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{DVDD}=3.3 \mathrm{~V}$, Play mode |  | 18 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on DVDD | $\overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{DVDD}=3.3 \mathrm{~V}$, Sleep mode |  | 0.75 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on DVDD | $\overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{DVDD}=3.3 \mathrm{~V}$, Deep Sleep mode |  | 0.75 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on DVDD | $\overline{\mathrm{PDN}}=0 \mathrm{~V}, \mathrm{DVDD}=3.3 \mathrm{~V}$, Shutdown mode |  | 5.5 | $\mu \mathrm{A}$ |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on PVDD | $\begin{aligned} & \overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{PVDD}=13.5 \mathrm{~V}, \mathrm{LC} \text { filter=10uH+0.68uF, } \\ & \mathrm{Fsw}=768 \mathrm{kHz}, \mathrm{BD} \text { Modulation, Play mode } \end{aligned}$ |  | 32.5 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on PVDD | $\overline{P D N}=2 \mathrm{~V}$, , PVDD=13.5V, LC filter=22uH+0.68uF, Fsw $=384 \mathrm{kHz}$, Hybrid Modulation, Play mode |  | 16.5 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on PVDD | $\overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{PVDD}=13.5 \mathrm{~V}$, Output Hiz Mode |  | 10.4 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on PVDD | $\overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{PVDD}=13.5 \mathrm{~V}$, Sleep Mode |  | 7.2 | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on PVDD | $\overline{\mathrm{PDN}}=2 \mathrm{~V}, \mathrm{PVDD}=13.5 \mathrm{~V}$, Deep Sleep Mode |  | 120 | $\mu \mathrm{A}$ |
| $\mathrm{I}_{\mathrm{cc}}$ | Quiescent supply current on PVDD | $\overline{\mathrm{PDN}}=0 \mathrm{~V}, \mathrm{PVDD}=13.5 \mathrm{~V}$, Shutdown Mode |  | 7.2 | $\mu \mathrm{A}$ |
| $\mathrm{t}_{\text {off }}$ | Turn-off Time | Excluding volume ramp |  | 10 | ms |
| $\mathrm{A}_{\mathrm{V} \text { (SPK_AMP) }}$ | Programmable Gain | Value represents the "peak voltage" disregarding clipping due to lower PVDD). <br> Measured at 0 dB input(1FS) | 4.87 | 29.5 | V |
| $\Delta \mathrm{A}_{\text {V(SPK_AMP) }}$ | Amplifier gain error | Gain $=29.5 \mathrm{Vp} / \mathrm{FS}$ |  | 0.5 | dB |
| fSPK_AMP | Switching frequency of the speaker amplifier |  |  | 384 | kHz |
|  |  |  |  | 768 | kHz |

### 6.5 Electrical Characteristics (continued)

Free-air room temperature $25^{\circ} \mathrm{C}$ (unless otherwise noted)

|  | PARAMETER | TEST CONDITIONS | MIN TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |

## Parameter Measurement Information

Figure 7-1. Serial Audio Port Timing in Slave Mode

Figure 7-2. $1^{2} \mathrm{C}$ Communication Port Timing Diagram

## 7 Detailed Description

### 7.1 Overview

The TAS5805M device integrates 4 main building blocks together into a single cohesive device that maximizes sound quality, flexibility, and ease of use. The 4 main building blocks are listed as follows:

- A stereo audio DAC.
- An Audio DSP subsystem.
- A flexible closed-loop amplifier capable of operating in stereo or mono, at different switching frequencies, and supporting a variety of output voltages and loads.
- An $I^{2} \mathrm{C}$ control port for communication with the device

The device requires only two power supplies for proper operation. A DVDD supply is required to power the low voltage digital circuitry. Another supply, called PVDD, is required to provide power to the output stage of the audio amplifier. Two internal LDOs convert PVDD to 5 V for GVDD and AVDD and to 1.5 V for DVDD respectively.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

### 7.3.1 Power Supplies

To facilitate system design, TAS5805M needs only a $3.3-\mathrm{V}$ or $1.8-\mathrm{V}$ supply in addition to the (typical) $12-\mathrm{V}$ or $24-$ V power-stage supply. Two internal voltage regulators provide suitable voltage levels for the gate drive circuitry and internal circuitry. The external pins are provided only as a connection point for off-chip bypass capacitors to filter the supply. Connecting external circuitry to these regulator outputs may result in reduced performance and damage to the device. Additionally, all circuitry requiring a floating voltage supply, e.g., the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only a few external capacitors. In order to provide good
electrical and acoustical characteristics, the PWM signal path for the output stage is designed as identical, independent half-bridges. For this reason, each half-bridge has separate bootstrap pins (BST_x). The gate drive voltages (AVDD) are derived from the PVDD voltage. Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power-supply pins and decoupling capacitors must be avoided. For a properly functioning bootstrap circuit, a small ceramic capacitor must be connected from each bootstrap pin (BST_x) to the power-stage output pin (OUT_x). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive regulator output pin (AVDD) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver.

### 7.3.2 Device Clocking

The TAS5805M devices have flexible systems for clocking. Internally, the device requires a number of clocks, mostly at related clock rates to function correctly. All of these clocks can be derived from the Serial Audio Interface.

Figure 7-1. Audio Flow with Respective Clocks
Figure 7-1 shows the basic data flow and clock distribution.
The Serial Audio Interface typically has 3 connection pins which are listed as follows:

- SCLK (Bit Clock)
- LRCLK/FS (Left Right Word Clock and Frame Sync)
- SDIN (Input Data)

The device has an internal PLL that is used to take SCLK (Bit Clock) as reference clock and create the higher rate clocks required by the DSP and the DAC clock.
The TAS5805M device has an audio sampling rate detection circuit that automatically senses the sampling frequency. Common audio sampling frequencies of $32 \mathrm{kHz}, 44.1 \mathrm{kHz}-48 \mathrm{kHz}, 88.2 \mathrm{kHz}-96 \mathrm{kHz}$ are supported. The sampling frequency detector sets the clock for DAC and DSP automatically.

### 7.3.3 Serial Audio Port - Clock Rates

The serial audio interface port is a 3 -wire serial port with the signals LRCLK/FS, SCLK, and SDIN. SCLK is the serial audio bit clock, used to clock the serial data present on SDIN into the serial shift register of the audio interface. Serial data is clocked into the TAS5805M device on the rising edge of SCLK. The LRCK/FS pin is the serial audio left/right word clock or frame sync when the device is operated in TDM Mode.

Table 7-1. Audio Data Formats, Bit Depths and Clock Rates

| FORMAT | DATA BITS | MAXIMUM LRCLK/FS FREQUENCY (kHz) | SCLK RATE ( $\mathrm{f}_{\mathrm{s}}$ ) |
| :---: | :---: | :---: | :---: |
| I2S/LJ/RJ | 32, 24, 20, 16 | 32 to 96 | 64, 32 |
| TDM | 32, 24, 20, 16 | 32 | 128 |
|  |  | 44.1,48 | 128,256,512 |
|  |  | 96 | 128,256 |

Before DSP register initialize with $\mathrm{I}^{2} \mathrm{C}$ during the startup, TAS5805M requires stable $\mathrm{I}^{2} \mathrm{~S}$ ready. When Clock halt, non-supported SCLK to LRCLK(FS) ratio is detected, the device reports Clock Error in Register 113 (Register Address 0x71).

### 7.3.4 Clock Halt Auto-recovery

As some of host processor will Halt the $I^{2} S$ clock when there is no audio playing. When Clock halt, the device puts all channels into the Hi-Z state and reports Clock Error in Register 113 (Register Address 0x71). After audio clocks recovery, the device automatically returns to the previous state.

### 7.3.5 Sample Rate on the Fly Change

TAS5805M supports LRCLK(FS) rate on the fly change. For example, change LCRLK from 32 kHz to 48 kHz or 96 kHz , Host processor needs to put the LRCLK(FS)/SCLK to Halt state at least 100us before changing to the new sample rate.

### 7.3.6 Serial Audio Port - Data Formats and Bit Depths

The device supports industry-standard audio data formats, including standard I2S, left-justified, right-justified and TDM/DSP data. Data formats are selected via Register (P0-R51-D[5:4]). If the high width of LRCK/FS in TDM/DSP mode is less than 8 cycles of SCK, the register (P0-R51-D[3:2]) should be set to 01. All formats require binary two's complement, MSB-first audio data; up to 32 -bit audio data is accepted. All the data formats, word length and clock rate supported by this device are shown in Table 7-1. The data formats are detailed in Figure 7-2 through Figure 7-6. The word length are selected via Register (P0-R51-D[1:0]). The offsets of data are selected via Register (P0-R51-D[7]) and Register (P0-R52-D[7:0]). Default setting is I2S and 24 bit word length.

Figure 7-2. Left-Justified Audio Data Format

Right-Justified Data Format; L-channel = HIGH, R-channel = LOW
Figure 7-4. Right-Justified Audio Data Format

TDM Data Format with OFFSET $=0$ In TDM Modes, Duty Cycle of LRCK/FS should be $1 \times$ SCLK at minimum. Rising edge is considered frame start.

Figure 7-5. TDM 1 Audio Data Format

TDM Data Format with OFFSET = 1
In TDM Modes, Duty Cycle of LRCK/FS should be 1x SCLK at minimum. Rising edge is considered frame start.
Figure 7-6. TDM 2 Audio Data Format

### 7.3.7 Digital Audio Processing

TAS5805M DSP has advanced process flows for different applications, refer to application note, TAS5805 Process Flows for details or request the PPC3 access for TAS5805M app .

### 7.3.8 Class D Audio Amplifier

Following the digital clipper, the interpolated audio data is next sent to the closed-Loop Class-D amplifier, whose first stage is Digital to PWM Conversion (DPC) block. In this block, the stereo audio data is translated into two pairs of complimentary pulse-width- modulated (PWM) signals which are used to drive the outputs of the speaker amplifier. Feedback loops around the DPC ensure constant gain across supply voltages, reducing distortion and improving immunity to the power supply noise. The analog gain is also applied in the Class-D amplifier section of the device.

### 7.3.8.1 Speaker Amplifier Gain Select

A combination of digital gain and analog gain is used to provide the overall gain of the speaker amplifier. As seen in Figure 7-7, the audio path of the TAS5805M consists of a digital audio input port, a digital audio path, a digital to PWM converter (DPC), a gate driver stage, a Class-D power stage, and a feedback loop which feeds the output information back into the DPC block to correct for distortion sensed on the output pins. The total amplifier gain consists of digital gain shown in the digital audio path, and the analog gain from the input of the analog modulator to the output of the speaker amplifier power stage.

Figure 7-7. Speaker Amplifier Gain
As shown in Figure 7-7, the first gain stage of the speaker amplifier is present in the digital audio path. Digital gain consists of the volume control, input Mixer or output Crossbar. The digital gain is set to 0 dB by default. Change analog gain via register $0 \times 54$, AGAIN[4:0] which supports 32 steps analog gain setting ( 0.5 dB per step). These analog gain settings ensure that the output signal is not clipped at different PVDD levels. OdBFS output corresponds to $29.5-\mathrm{V}$ peak output voltage.

Table 7-2. Analog Gain Setting

| AGAIN $\langle 4: 0>$ | GAIN (dBFS) | AMPLIFIER PEAK OUTPUT VOLTAGE (V) |
| :---: | :---: | :---: |
| 00000 | 0 | 29.5 |
| 00001 | -0.5 | 27.85 |
| $\ldots \ldots$. | $\ldots \ldots$. | $\ldots \ldots$ |
| 11111 | -15.5 | 4.95 |

### 7.3.8.2 Class D Loop Bandwidth and Switching Frequency Setting

TAS5805M closed loop structure provides Loop bandwidth setting option (Setting by register 83 -Register address $0 \times 53 \mathrm{~h}-\mathrm{D}[6-5]$ ) to co-work with different switching frequency (Setting by register 2 -Register address
$0 \times 02 \mathrm{~h}-\mathrm{D}[6-4]$ ). Table $7-3$ shows recommended settings for the Loop Bandwidth and Switching Frequency selection. Same Fsw, Better THD+N performance with higher BW.

Table 7-3. Loop Bandwidth and Switching Frequency Setting

| Modulation Scheme | Fsw | BW (Loop Band Width) | Notes |
| :---: | :---: | :---: | :---: |
| Hybrid, 1SPW | 384kHz | 80kHz | Principle: Fsw (Switching Frequency) $\geq 4.2 \times$ Loop Bandwidth |
|  | 480 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}$ |  |
|  | 576 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}, 120 \mathrm{kHz}$ |  |
|  | 768 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}, 120 \mathrm{kHz}$, 175kHz |  |
| BD | 384 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}, 120 \mathrm{kHz}$ | Principle: Fsw (Switching Frequency) $\geq 3 \times$ Loop Bandwidth |
|  | 480 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}, 120 \mathrm{kHz}$ |  |
|  | 576 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}, 120 \mathrm{kHz}, 175 \mathrm{kHz}$ |  |
|  | 768 kHz | $80 \mathrm{kHz}, 100 \mathrm{kHz}, 120 \mathrm{kHz}, 175 \mathrm{kHz}$ |  |

SLASEH5D - MAY 2018 - REVISED NOVEMBER 2020

### 7.4 Device Functional Modes

### 7.4.1 Software Control

The TAS5805M device is configured via an $\mathrm{I}^{2} \mathrm{C}$ communication port.
The $I^{2} C$ Communication Protocol is detailed in the $I^{2} C$ Communication Port section. The $I^{2} C$ timing requirements are described in the $I^{2} C$ Bus Timing - Standard and $I^{2} C$ Bus Timing - Fast sections.

### 7.4.2 Speaker Amplifier Operating Modes

The TAS5805M device can be used in two different amplifier configurations:

- BTL Mode
- PBTL Mode

### 7.4.2.1 BTL Mode

In BTL mode, the TAS5805M amplifies two independent signals, which represent the left and right portions of a stereo signal. The amplified left signal is presented on differential output pair shown as OUT_A+ and OUT_A-, the amplified right signal is presented on differential output pair shown as OUT_B+ and OUT_B-.

### 7.4.2.2 PBTL Mode

The PBTL mode of operation is used to describe operation in which the two outputs of the device are placed in parallel with one another to increase the power sourcing capabilities of the device. On the output side of the TAS5805M device, the summation of the devices can be done before the filter in a configuration called Pre-Filter Parallel Bridge Tied Load (PBTL). However, the two outputs can be required to merge together after the inductor portion of the output filter. Doing so does require two additional inductors, but allows for smaller, less-expensive inductors to be used because the current is divided between the two inductors. The process is called Post-Filter PBTL. On the input side of the TAS5805M device, the input signal to the PBTL amplifier is left frame of $\operatorname{I2S}$ or TDM data.

### 7.4.3 Low EMI Modes

TAS5805M employs several modes to minimize EMI during playing audio, and they can be used based on different applications.

### 7.4.3.1 Spread Spectrum

Spread spectrum is used in some inductor free case to minimize EMI noise. The TAS5805M supports Spread Spectrum with triangle mode.

User needs to configure register SS_CTRLO (0x6B) to enable Spread Spectrum with triangle mode, and select spread spectrum frequency and range with SS_CTRL1 (0x6C). For 384 kHz F sw which configured by DEVICE_CTRL1 (0x02), the Spread Spectrum frequency and range are described inTable 7-4

Table 7-4. Triangle Mode Spread Spectrum Frequency and Range Selection

| $\begin{gathered} \text { SS_TRI_CT } \\ \text { RL[3:0] } \end{gathered}$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Triangle Freq | 24k |  |  |  | 48k |  |  |  |
| Spread Spectrum Range | 5\% | 10\% | 20\% | 25\% | 5\% | 10\% | 20\% | 25\% |

User Application example-Central Switching Frequency is 384 kHz , Triangle Frequency is 24 kHz :
w 586 b 03 //Enable Spread Spectrum
w 58 6c 03 //SS_TRI_CTRL[3:0]0011, Triangle Frequency $=24 \mathrm{kHz}$, Spread Spectrum Range should be $25 \%$ ( $336 \mathrm{kHz} \sim 432 \mathrm{kHz}$ )

### 7.4.3.2 Channel to Channel Phase Shift

This device supports channel to channel 180-degree PWM phase shift to minimize the EMI.

### 7.4.3.3 Multi-Devices PWM Phase Synchronization

This device supports up to 4 phases selection for the multi devices application system. For example, when a system integrated 4 pieces of TAS5805M devices, user can select phase $0 / 1 / 2 / 3$ for each device with register PHASE_CTRL (0x6A), which means there is a 45-degree phase shift between each device to minimize the EMI.
Recommend to do the Phase Synchronization with ${ }^{2}$ S clock during the Startup Phase:

1. Halt $I^{2} S$ clock.
2. Configure each device phase selection and enable the phase synchronization. For example: Register $0 \times 6 \mathrm{~A}=$ $0 \times 03$ for device 0; Register $0 \times 6 A=0 \times 07$ for device 1; Register $0 \times 6 A=0 \times 0 B$ for device 2 ; Register $0 \times 6 A=$ $0 x 0 F$ for device 3. There should be a 45-degree PWM phase shift between each device to minimize the EMI.
3. Configure each device into $\mathrm{Hi}-\mathrm{Z}$ mode.
4. Provide $I^{2} S$ to each device. Phase synchronization for all 4 devices will be automatically done by internal sequence.
5. Initialize the DSP code. (This step can be skipped if only need to do the PWM Phase Synchronization).
6. Device to Device PWM phase shift should be fixed with 45 degree.

### 7.4.4 Thermal Foldback

The Thermal Foldback (TFB), is designed to protect TAS5805M from excessive die temperature increases, in case the device operates beyond the recommended temperature/power limit, or with a weaker thermal system design than recommended. It allows the TAS5805M to play as loud as possible without triggering unexpected thermal shutdown. When the die temperature triggers the over-temperature warning (OTW) level (135C typ), an internal AGL (Automatic Gain Limiter) will reduce the digital gain automatically. Once the die temperature drops below the OTW, the device's digital gain gradually returns to the former setting. Both the attenuation gain and adjustable rate are programmable. The TFB gain regulation speed (attack rate and release rate) settings are the same as a regular AGL, which is also configurable with TAS5805M App in PurePathTM Console3.

### 7.4.5 Device State Control

TAS5805M has 5 states with different power dissipation which listed in the Electrical Characteristics Table.

- Shutdown Mode. With PDN pin pull down to GND. All internal LDOs (1.5V for digital core, 5 V for analog) are disabled, all registers will be cleared to default value.

## Note

Exit from Shutdown Mode and re-enter into Play mode, need reload all register configurations (which generated by PurePath Console3) again.

- Deep Sleep Mode. Register 0x03h -D[1:0]=00, device stays in Deep Sleep Mode. In this mode, I2C block and 1.5V LDO for digital core still working, but internal 5V LDO (For AVDD and MOSFET gate driver) is disabled for low power dissipation. This mode can be used to extend the battery life in some portable speaker applications. If the host processor stops playing audio for a long time, TAS5805M can be set to Deep Sleep Mode to minimize power dissipation until host processor starts playing audio again. Unlike the Shutdown Mode (Pulling PDN Low), entering or exiting Deep Sleep Mode, the DSP keeps active.

## Note

As in Deep Sleep Mode, the internal 5V LDO (For AVDD and internal MOSFET gate driver) is disabled. Exit from Deep Sleep Mode (Register 0x03h -D[1:0]=00) and re-enter into Play mode (Register 0x03h-D[1:0]=11), Below sequence is required for internal Finite-state machine fast setting (Take TAS5805M I ${ }^{2}$ C device address $=0 \times 58$ as example).
w 580000 \#Go to page 0
w 587 f 00 \#Change the book to $0 \times 00$
w 580302 \#Change the device into Hiz Mode
w 580300 \#Change the device into Deep Sleep Mode
w 580000 \#Go to page 0
w 587 f 00 \#Change the book to $0 \times 00$
w 580302 \#Change the device into Hiz Mode
w 580303 \#Change the device into Play Mode

- Sleep Mode. Register 0x03h -D[1:0]=01, device stays in Sleep Mode. In this mode, I2 C block, Digital core, DSP Memory , 5V Analog LDO are stilling working. Unlike the Shutdown Mode (Pull $\overline{\text { PDN Low), enter or exit }}$ Sleep Mode, DSP is kept active. Exit from this mode and re-enter into play mode, only need to set Register $0 x 03 \mathrm{~h}-\mathrm{D}[1: 0]=11$.
- Output Hiz Mode. Register 0x03h - $\mathrm{D}[1: 0]=10$, device stays in Hiz Mode. In this mode, only output driver is set to be Hi-Z state, all other block operate normally. Exit from this mode and re-enter into play mode, only need to set Register $0 \times 03 \mathrm{~h}-\mathrm{D}[1: 0 \mathrm{0}=11$.
- Play Mode. Register 0x03h -D[1:0]=11, device stays in Play Mode.

### 7.4.6 Device Modulation

TAS5805M has 3 modulation schemes: BD Modulation, 1SPW modulation and Hybrid modulation. Select modulation schemes for TAS5805M with Register 0x02 [1:0]-DAMP_MOD.

### 7.4.6.1 BD Modulation

This is a modulation scheme that allows operation without the classic LC reconstruction filter when the amp is driving an inductive load with short speaker wires. Each output is switching from 0 volts to the supply voltage. The OUTPx and OUTNx are in phase with each other with no input so that there is little or no current in the speaker. The duty cycle of OUTPx is greater than $50 \%$ and OUTNx is less than $50 \%$ for positive output voltages. The duty cycle of OUTPx is less than $50 \%$ and OUTNx is greater than $50 \%$ for negative output voltages. The voltage across the load sits at 0 V throughout most of the switching period, reducing the switching current, which reduces any $I^{2} R$ losses in the load.

Figure 7-8. BD Mode Modulation

### 7.4.6.2 1SPW Modulation

The 1SPW mode alters the normal modulation scheme in order to achieve higher efficiency with a slight penalty in THD degradation and more attention required in the output filter selection. In Low Idle Current mode the outputs operate at $\sim 14 \%$ modulation during idle conditions. When an audio signal is applied one output will decrease and one will increase. The decreasing output signal will quickly rail to GND at which point all the audio modulation takes place through the rising output. The result is that only one output is switching during a majority of the audio cycle. Efficiency is improved in this mode due to the reduction of switching losses.

Figure 7-9. 1SPW Mode Modulation

### 7.4.6.3 Hybrid Modulation

Hybrid Modulation is designed to minimized power loss without compromising the THD+N performance, and is optimized for battery-powered applications. With Hybrid modulation enabled, device detects the input signal level and adjust PWM duty cycle dynamically based on PVDD. Hybrid modulation achieves ultra low idle current and maintains the same audio performance level as the BD Modulation. In order to minimize the power dissipation, low switching frequency (For example, Fsw $=384 \mathrm{kHz}$ ) with proper LC filter ( $15 \mu \mathrm{H}+0.68 \mu \mathrm{~F}$ or $22 \mu \mathrm{H}+0.68$ $\mu F$ ) is recommended.

## Note

1) With Hybrid Modulation, users need to input the system's PVDD value via device development App.
2) With Hybrid Modulation, Change device state from Deep Sleep Mode to Play Mode, specific sequence is required:
1. Set device's PWM Modulation to BD or 1SPW mode via Register (Book0/Page0/Register0x02h, Bit [1:0]).
2. Set device to Hi-Z state via Register (Book0/Page0/Register0x03h, Bit [1:0]).
3. Delay 2 ms .
4. Set device's PWM Modulation to Hybrid mode via Register (Book0/Page0/Register0x02h, Bit [1:0]).
5. Delay 15 ms .
6. Set device to Play state via Register (Book0/Page0/Register0x03h, Bit [1:0]).

### 7.5 Programming and Control

### 7.5.1 $\mathrm{I}^{2} \mathrm{C}$ Serial Communication Bus

The device has a bidirectional serial control interface that is compatible with the Inter IC ( $\mathrm{I}^{2}$ )C bus protocol and supports 100 and $400-\mathrm{kHz}$ data transfer rates for random and sequential write and read operations as a slave device. Because the TAS5805M register map and DSP memory spans multiple pages, users should change from page to page before writing individual registes or DSP memory. Changing from page to page is accomplished by writing to register 0 on each page. Its register value selects the page address, from 0 to 255 .

### 7.5.2 Slave Address

The TAS5805M device has 7 bits for the slave address. The first five bits (MSBs) of the slave address are factory preset to $01011(0 x 5 x)$. The next two bits of address byte are the device select bits which can be userdefined by ADR pin in Table 7-5.

Table 7-5. $\mathrm{I}^{2} \mathrm{C}$ Slave Address Configuration

| ADR PIN Configuration | MSBs |  |  |  |  | User Define |  | LSB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $4.7 \mathrm{k} \Omega$ to DVDD | 0 | 1 | 0 | 1 | 1 | 0 | 0 | R/ $\bar{W}$ |
| $15 \mathrm{k} \Omega$ to DVDD | 0 | 1 | 0 | 1 | 1 | 0 | 1 | R/ $\bar{W}$ |
| $47 \mathrm{k} \Omega$ to DVDD | 0 | 1 | 0 | 1 | 1 | 1 | 0 | R/ W |
| $120 \mathrm{k} \Omega$ to DVDD | 0 | 1 | 0 | 1 | 1 | 1 | 1 | R/ $\bar{W}$ |

### 7.5.2.1 Random Write

As shown in Figure 7-10, a single-byte data-write transfer begins with the master device transmitting a start condition followed by the $I^{2} \mathrm{C}$ device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit is a 0 . After receiving the correct $I^{2} \mathrm{C}$ device address and the read/write bit, the device responds with an acknowledge bit. Next, the master transmits the address byte corresponding to the internal memory address being accessed. After receiving the address byte, the device again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the device again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data-write transfer.

Figure 7-10. Random Write Transfer

### 7.5.2.2 Sequential Write

A sequential data-write transfer is identical to a single-byte data-write transfer except that multiple data bytes are transmitted by the master to the device as shown in Figure 7-11. After receiving each data byte, the device responds with an acknowledge bit and the $\mathrm{I}^{2}$ subaddress is automatically incremented by one.

Figure 7-11. Sequential Write Transfer

### 7.5.2.3 Random Read

As shown in Figure 7-12, a single-byte data-read transfer begins with the master device transmitting a start condition followed by the $I^{2} \mathrm{C}$ device address and the read/write bit. For the data-read transfer, both a write followed by a read are actually done. Initially, a write is done to transfer the address byte of the internal memory address to be read. As a result, the read/write bit is a 0 . After receiving the address and the read/write bit, the device responds with an acknowledge bit. In addition, after sending the internal memory address byte, the master device transmits another start condition followed by the address and the read/write bit again. This time the read/write bit is a 1, indicating a read transfer. After receiving the address and the read/write bit, the device again responds with an acknowledge bit. Next, the device transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the single-byte data-read transfer.

Figure 7-12. Random Read Transfer

### 7.5.2.4 Sequential Read

A sequential data-read transfer is identical to a single-byte data-read transfer except that multiple data bytes are transmitted by the device to the master device as shown in Figure 7-13. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte and automatically increments the $I^{2} \mathrm{C}$ sub address by one. After receiving the last data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the transfer.

Figure 7-13. Sequential Read Transfer

### 7.5.2.5 DSP Memory Book, Page and BQ Coefficients Update

The TAS5805M device supports the $I^{2} \mathrm{C}$ serial bus and the data transmission protocol for standard and fast mode as a slave device.

The DSP memory is arranged in books, pages, and registers. Each book has several pages and each page has several registers.

Because the TAS5805M register map spans several books and pages, the user must select the correct book and page before writing individual register bits or bytes.

To change the book, the user must be on page $0 x 00$. In register $0 x 7 f$ on page $0 x 00$ you can change the book. On page $0 x 00$ of each book, register $0 x 7 f$ is used to change the book. Register $0 x 00$ of each page is used to change the page. To change a book first write $0 x 00$ to register $0 x 00$ to switch to page 0 then write the book number to register $0 x 7 f$ on page 0 . To change between pages in a book, simply write the page number to register 0x00.
All the Biquad Filters coefficients are addressed in Book 0xAA. The five coefficients of every Biquad Filter should be written entirely and sequentially from the lowest address to the highest .
All DSP/Audio Process Flow Related Register are listed in Application Note, TAS5805M Process Flows

### 7.5.2.6 Example Use

Example 1, The following is a sample script for configuring a device on I2C slave address $0 \times 58$ and set the device switching frequency to 768 kHz with Class D loop bandwidth to 175 kHz , BD Modulation:
w 580000 \#Go to Page0
w 587 f 00 \#Change the Book to $0 x 00$
w 580000 \#Go to Page 0x00
w 580200 \#Set switching frequency to 768 kHz with BD Modulation
w 585360 \#Set Class D Loop Bandwidth to 175 kHz
Example 2, The following is a sample script for configuring a device on I2C slave address $0 \times 58$ and using the DSP host memory to change the digital volume to the default value of 0 dB :
w 580000 \#Go to Page 0
w 58 7f 8c \#Change the Book to 0x8C
w 5800 2a \#Go to Page 0x2a
w 582400800000 \#change digital volume to 0dB

### 7.5.2.7 Checksum

This device supports two different check sum schemes, a cyclic redundancy check (CRC) checksum and an Exclusive (XOR) checksum. Register reads do not change checksum, but writes to even nonexistent registers will change the checksum. Both checksums are 8 -bit checksums and both are available together simultaneously. The checksums can be reset by writing a starting value (eg. $0 x 00000000$ ) to their respective 4-byte register locations.

### 7.5.2.7.1 Cyclic Redundancy Check (CRC) Checksum

The 8-bit CRC checksum used is the $0 x 7$ polynomial (CRC-8-CCITT I.432.1; ATM HEC, ISDN HEC and cell delineation, $(1+x 1+x 2+x 8)$ ). A major advantage of the CRC checksum is that it is input order sensitive. The CRC supports all ${ }^{2} \mathrm{C}$ transactions, excluding book and page switching. The CRC checksum is read from register $0 \times 7 \mathrm{E}$ on page0 of any book (B_x, Page_0, Reg_126). The CRC checksum can be reset by writing $0 \times 00$ to the same register locations where the CRC checksum is valid.

### 7.5.2.7.2 Exclusive or (XOR) Checksum

The Xor checksum is a simpler checksum scheme. It performs sequential XOR of each register byte write with the previous 8 -bit checksum register value. XOR supports only Book $0 \times 8 \mathrm{C}$, and excludes page switching and all registers in Page $0 \times 00$ of Book 0x8C. XOR checksum is read from location register $0 \times 7 \mathrm{D}$ on page $0 \times 00$ of book $0 \times 8 \mathrm{C}$ (B_140, Page_0, Reg_125). The XOR Checksum can be reset by writing $0 \times 00$ to the same register location where it is read.

### 7.5.3 Control via Software

- Startup Procedures
- Shutdown Procedures

### 7.5.3.1 Startup Procedures

1. Configure ADR/ FAULT pin with proper settings for $I^{2} \mathrm{C}$ device address.
2. Bring up power supplies (it does not matter if PVDD or DVDD comes up first).
3. Once power supplies are stable, bring up $\overline{\text { PDN }}$ to High and wait 5 ms at least, then start SCLK, LRCLK.
4. Once $I^{2}$ S clocks are stable, set the device into HiZ state and enable DSP via the $I^{2} \mathrm{C}$ control port.
5. Wait 5 ms at least. Then initialize the DSP Coefficient, then set the device to Play state.
6. The device is now in normal operation.

Figure 7-14. Start-up Sequence

### 7.5.3.2 Shutdown Procedures

1. The device is in normal operation.
2. Configure the Register $0 \times 03 \mathrm{~h}-\mathrm{D}[1: 0]=10(\mathrm{Hiz})$ via the $\mathrm{I}^{2} \mathrm{C}$ control port or Pull $\overline{\mathrm{PDN}}$ low.
3. Wait at least 6 ms (this time depends on the LRCLK rate ,digital volume and digital volume ramp down rate).
4. Bring down power supplies.
5. The device is now fully shut down and powered off.

- Before PVDD/DVDD power down, Class D Output driver needs to be disabled by $\overline{P D N}$ or by $I^{2} C$.
- At least 6 ms delay needed based on LRCLK $($ Fs $)=48 \mathrm{kHz}$,Digital volume ramp down update every sample period, decreased by 0.5 dB for each update, digital volume $=24 \mathrm{~dB}$. Change the value of register $0 \times 4 \mathrm{C}$ and $0 \times 4 \mathrm{E}$ or change the LRCLK rate, the delay changes.

Figure 7-15. Power-Down Sequence

### 7.5.3.3 Protection and Monitoring

### 7.5.3.3.1 Overcurrent Shutdown (OCSD)

Under severe short-circuit event, such as a short to PVDD or ground, the device uses a peak-current detector, and the affected channel shuts down in < 100 ns if the peak current are big enough. The shutdown speed depends on a number of factors, such as the impedance of the short circuit, supply voltage, and switching frequency. The user may restart the affected channel via $I^{2} \mathrm{C}$. An OCSD event activates the fault pin, and the $I^{2} \mathrm{C}$ fault register saves a record. If the supply or ground short is strong enough to exceed the peak current threshold but not severe enough to trigger the OSCD, the peak current limiter prevents excess current from damaging the output FETs, and operation returns to normal after the short is removed.

### 7.5.3.3.2 Speaker DC Protection

If the device measures $\mathrm{a}>1.9 \mathrm{~V}$ (Typical) DC offset and continue more than 570 ms (typical) on the output stage, the ADR/ FAULT line will be pulled low and set the OUTxx outputs to Hi-Z state to protect speaker, signifying a fault in Register 0x70 in Book0/Page0. This fault report bit in Register 0x70 keeps 1 and device keeps in Hi-Z mode unless clear it by Register 0x78 in Book0/Page0 manually.

### 7.5.3.3.3 Device Over Temperature Protection

Once the die temperature exceed $160^{\circ} \mathrm{C}$ (Typical), device will set the output driver from Play mode to Hi-Z Mode. Over temperature shutdown fault reported by Register 0x72 in Book0/Page0. Set this fault's behavior to Autorecovery mode, device will come back to play mode automatically once the die temperature drop down to $150^{\circ} \mathrm{C}$ or device needs re-enter into play mode by clearing fault with Register 0x78 in Book0/Page0.

### 7.5.3.3.4 Device Over Voltage/Under Voltage Protection

### 7.5.3.3.4.1 Over Voltage Protection

Once the PVDD voltage exceed the OVE THRES(PVDD) $(28.1 \mathrm{~V}$ Typical), device will set the output driver from Play mode to Hi-Z mode. Over voltage fault reported by Regoster 0x71 in Book0/Page0. Once PVDD drop below 27.5 V (Typical), device will come back to Play mode. But this bit still keeps 1 unless clear it by Registerr 0x78 in Book0/Page0 manually.

### 7.5.3.3.4.2 Under Voltage Protection

Once the PVDD voltage drop below the UVE THRES(PVDD) $(4 \mathrm{~V}$ Typical), device will set the output driver from Play mode to Hi-Z mode. Under voltage fault reported by Register 0x71 in Book0/Page0. Once PVDD rise above 4.25 V (Typical), device will come back to Play mode. But this bit still keeps 1 unless clear it by Register 0x78 in Book0/Page0 manually.

### 7.5.3.3.5 Clock Fault

Once there has any Clock error occurs (Clock Halt, SCLK/LRCLK Ratio Error, Pll unlock, FS error), Register $0 \times 37$ and Register $0 \times 39$ monitor these errors and real-time report with details, device will enter into Hi-Z mode. Clock Fault reported in Register 0x71 in Book0/Page0. Once the clock error been removed, device will come back to play mode automatically. But this bit still keeps 1 unless clear it by Register 0x78 in Book0/Page0 manually.

TAS5805M

### 7.6 Register Maps

### 7.6.1 CONTROL PORT Registers

Table 7-6 lists the memory-mapped registers for the CONTROL PORT. All register offset addresses not listed in Table 7-6 should be considered as reserved locations and the register contents should not be modified.

Table 7-6. CONTROL PORT Registers

| Offset | Acronym | Register Name | Section |
| :---: | :---: | :---: | :---: |
| 1h | RESET_CTRL | Register 1 | Go |
| 2 h | DEVICE_CTRL_1 | Register 2 | Go |
| 3h | DEVICE_CTRL_2 | Register 3 | Go |
| Fh | I2C_PAGE_AUTO_INC | Register 15 | Go |
| 28h | SIG_CH_CTRL | Register 40 | Go |
| 29h | CLOCK_DET_CTRL | Register 41 | Go |
| 30h | SDOUT_SEL | Register 48 | Go |
| 31h | I2S_CTRL | Register 49 | Go |
| 33h | SAP_CTRL1 | Register 51 | Go |
| 34h | SAP_CTRL2 | Register 52 | Go |
| 35h | SAP_CTRL3 | Register 53 | Go |
| 37h | FS_MON | Register 55 | Go |
| 38h | BCK_MON | Register 56 | Go |
| 39h | CLKDET_STATUS | Register 57 | Go |
| 4Ch | DIG_VOL_CTRL | Register 76 | Go |
| 4Eh | DIG_VOL_CTRL2 | Register 78 | Go |
| 4Fh | DIG_VOL_CTRL3 | Register 79 | Go |
| 50h | AUTO_MUTE_CTRL | Register 80 | Go |
| 51h | AUTO_MUTE_TIME | Register 81 | Go |
| 53h | ANA_CTRL | Register 83 | Go |
| 54h | AGAIN | Register 84 | Go |
| 5Ch | BQ_WR_CTRL1 | Register 92 | Go |
| 5Dh | DAC_CTRL | Register 93 | Go |
| 60h | ADR_PIN_CTRL | Register 96 | Go |
| 61h | ADR_PIN_CONFIG | Register 97 | Go |
| 66h | DSP_MISC | Register 102 | Go |
| 67h | DIE_ID | Register 103 | Go |
| 68h | POWER_STATE | Register 104 | Go |
| 69h | AUTOMUTE_STATE | Register 105 | Go |
| 6Ah | PHASE_CTRL | Register 106 | Go |
| 6Bh | SS_CTRL0 | Register 107 | Go |
| 6Ch | SS_CTRL1 | Register 108 | Go |
| 6Dh | SS_CTRL2 | Register 109 | Go |
| 6Eh | SS_CTRL3 | Register 110 | Go |
| 6Fh | SS_CTRL4 | Register 111 | Go |
| 70h | CHAN_FAULT | Register 112 | Go |
| 71h | GLOBAL_FAULT1 | Register 113 | Go |
| 72h | GLOBAL_FAULT2 | Register 114 | Go |
| 73h | OT WARNING | Register 115 | Go |
| 74h | PIN_CONTROL1 | Register 116 | Go |
| 75h | PIN_CONTROL2 | Register 117 | Go |

Table 7-6. CONTROL PORT Registers (continued)

| Offset | Acronym | Register Name | Section |
| :---: | :--- | :--- | :---: |
| 76 h | MISC_CONTROL | Register 118 | Go |
| 78 h | FAULT_CLEAR | Register 120 | Go |

Complex bit access types are encoded to fit into small table cells. Table 7-7 shows the codes that are used for access types in this section.

Table 7-7. CONTROL PORT Access Type Codes

| Access Type | Code | Description |
| :--- | :--- | :--- |
| Read Type |  |  |
| R | R | Read |
| Write Type |  |  |
| W | W | Write |
| Reset or Default Value |  |  |
| $-n$ |  | Value after reset or the default <br> value |

### 7.6.1.1 RESET_CTRL Register (Offset = 1h) [reset = 0x00]

RESET_CTRL is shown in Figure 7-12 and described in Table 7-8.
Return to Summary Table.
Figure 7-12. RESET_CTRL Register

## 8 Application and Implementation

## Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

This section details the information required to configure the device for several popular configurations and provides guidance on integrating the TAS5805M device into the larger system.

### 8.1.1 Bootstrap Capacitors

The output stage of the TAS5805M uses a high-side NMOS driver, rather than a PMOS driver. To generate the gate driver voltage for the high-side NMOS, a bootstrap capacitor for each output terminal acts as a floating power supply for the switching cycle. Use $0.22-\mu \mathrm{F}$ capacitors to connect the appropriate output pin (OUT_X) to the bootstrap pin (BST_X). For example, connect a $0.22-\mu \mathrm{F}$ capacitor between OUT_A and BST_A for bootstrapping the A channel. Similarly, connect another $0.22-\mu \mathrm{F}$ capacitor between the OUT_B and BST_B pins for the $B$ channel inverting output.

### 8.1.2 Inductor Selections

It is required that the peak current is smaller than the OCP (Over current protection) value which is 5 A , there are 3 cases which cause high peak current flow through inductor.

1. During power up (idle state, no audio input), the duty cycle increases from 0 to $\theta$.

$$
\begin{equation*}
I_{\text {peak_power_up }} \approx P V D D \times \sqrt{C / L} \times \sin \left(1 / \sqrt{L \times C} \times \theta / F_{s w}\right) \tag{1}
\end{equation*}
$$

## Note

$\theta=0.5$ (BD Modulation), 0.14 (1SPW Modulation), 0.14 (Hybrid Modulation). This formula just provide a rough estimation, suggest to measure the start-up current based on your LC filter.

Table 8-1. Peak current during power up

| PVDD | $\mathbf{L}(\mathbf{u H})$ | $\mathbf{C}(\mathbf{u F})$ | Fsw (kHz) | $\mathbf{I}_{\text {peak_power_up }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 24 | 4.7 | 0.68 | 384 | $6.07 \mathrm{~A}(>5 \mathrm{~A}$ OCP), not <br> recommended |
| 24 | 4.7 | 0.68 | 768 | 3.25 A |
| 24 | 10 | 0.68 | 384 | 3 A |
| 24 | 10 | 0.68 | 768 | 1.55 A |
| 12 | 4.7 | 0.68 | 384 | 3.32 A |
| 12 | 10 | 0.68 | 384 | 1.55 A |

2. During music playing, some audio burst signal (high frequency) with very hard PVDD clipping will cause PWM duty cycle increase dramatically. This is the worst case and it rarely happens.

$$
\begin{equation*}
I_{\text {peak_clipping }} \approx P V D D \times(1-\theta) /\left(F_{s w} \times L\right) \tag{2}
\end{equation*}
$$

3. Peak current due to Max output power. Ignore the ripple current flow through capacitor here.

$$
\begin{equation*}
I_{\text {peak_oupput }- \text { power }} \approx \sqrt{2 \times \text { Max_Output_Power } / R_{\text {speaker_Load }}} \tag{3}
\end{equation*}
$$

Same PVDD and switching frequency, larger inductance means smaller idle current for lower power dissipation.

It's suggested that inductor's saturation current $I_{\text {sat }}$, is larger than the amplifier's peak current during power-up and play audio.

$$
\begin{equation*}
I_{S A T} \geq \max \left(I_{\text {peak_power_up }}, I_{\text {peak_clipping }} I_{\text {peak_output_power }}\right) \tag{4}
\end{equation*}
$$

In addition, the effective inductance at the peak current is required to be at least $80 \%$ of the inductance value in Table 8-2, to meet datasheet specifications.

The minimum inductance is given in Table 8-2
Table 8-2. LC filter recommendation

| PVDD (V) | Switching Frequency (kHz) | Modulation Scheme | Recommended Minimum <br> Inductance (uH) for LC filter design |
| :---: | :---: | :---: | :---: |
| $\leq 12$ | 384 | BD | $4.7 \mathrm{uH}+0.68 \mathrm{uF}$ |
| $>12$ |  |  | $10 \mathrm{uH}+0.68 \mathrm{uF}$ |
| $\leq 12$ | 384 | 1 SPW/Hybrid | $10 \mathrm{uH}+0.68 \mathrm{uF}$ |
| $>12$ |  |  | $15 \mathrm{uH}+0.68 \mathrm{uF}$ |

For higher switching frequency (Fsw), select inductors with minimum inductance to be $384 \mathrm{kHz} / \mathrm{F}_{\mathrm{sw}} \times \mathrm{L}$.

### 8.1.3 Power Supply Decoupling

To ensure high efficiency, low THD, and high PSRR, proper power supply decoupling is necessary. Noise transients on the power supply lines are short duration voltage spikes. These spikes can contain frequency components that extend into the hundreds of megahertz. The power supply input must be decoupled with some good quality, low ESL, Low ESR capacitors larger than $22 \mu \mathrm{~F}$. These capacitors bypasses low frequency noise to the ground plane. For high frequency decoupling, place $1-\mu \mathrm{F}$ or $0.1-\mu \mathrm{F}$ capacitors as close as possible to the PVDD pins of the device.

### 8.1.4 Output EMI Filtering

The TAS5805M device is often used with a low-pass filter, which is used to filter out the carrier frequency of the PWM modulated output. This filter is frequently referred to as the L-C Filter, due to the presence of an inductive element $L$ and a capacitive element $C$ to make up the 2-pole filter.

The L-C filter removes the carrier frequency, reducing electromagnetic emissions and smoothing the current waveform which is drawn from the power supply. The presence and size of the L-C filter is determined by several system level constraints. In some low-power use cases that have no other circuits which are sensitive to EMI, a simple ferrite bead or a ferrite bead plus a capacitor can replace the tradition large inductor and capacitor that are commonly used. In other high-power applications, large toroid inductors are required for maximum power and film capacitors can be used due to audio characteristics. Refer to the application report Class-D LC Filter Design (SLOA119) for a detailed description on the proper component selection and design of an L-C filter based upon the desired load and response.

### 8.2 Typical Applications

### 8.2.1 2.0 (Stereo BTL) System

In the 2.0 system, two channels are presented to the amplifier via the digital input signal. These two channels are amplified and then sent to two separate speakers. In some cases, the amplified signal is further separated based upon frequency by a passive crossover network after the L-C filter. Even so, the application is considered 2.0.

Most commonly, the two channels are a pair of signals called a stereo pair, with one channel containing the audio for the left channel and the other channel containing the audio for the right channel. While certainly the two channels can contain any two audio channels, such as two surround channels of a multi-channel speaker system, the most popular occurrence in two channels systems is a stereo pair.
Figure 8-1 shows the 2.0 (Stereo BTL) system application.

Figure 8-1. 2.0 (Stereo BTL) System Application Schematic with Ferrite Bead as the output filter

Figure 8-2. 2.0 (Stereo BTL) System Application Schematic with Inductor as the output filter

### 8.2.1.1 Design Requirements

- Power supplies:
- $3.3-\mathrm{V}$ or $1.8-\mathrm{V}$ supply
- 4.5-V to $24-\mathrm{V}$ supply
- Communication: host processor serving as $I^{2} \mathrm{C}$ compliant master
- External memory (Such as EEPROM and FLASH) used for coefficients

The requirement for the supporting components for the TAS5805M device in a Stereo 2.0 (BTL) system is provide in Table 8-3 and Table 8-4
Table 8-3. Supporting Component Requirements for Stereo 2.0 (BTL) system (With Ferrite bead as output filter)

| REFERENCE <br> DESIGNATOR | VALUE | SIZE | DETAILED DESCRIPTION |

Table 8-3. Supporting Component Requirements for Stereo 2.0 (BTL) system (With Ferrite bead as output filter) (continued)

| REFERENCE DESIGNATOR | VALUE | SIZE | DETAILED DESCRIPTION |
| :---: | :---: | :---: | :---: |
| R1 | 4.70k | 0402 | RES, $4.70 \mathrm{k}, 1 \%, 0.0625 \mathrm{~W}, 0402$ |
| R2 | 10.0k | 0404 | RES, 10.0 k, 1\%, $0.063 \mathrm{~W}, 0402$ |
| C11,C12,C13,C14 | 0.22uF | 0603 | CAP, CERM, $0.22 \mu \mathrm{~F}, 50 \mathrm{~V},+/-10 \%$, X7R, 0603 |
| $\begin{gathered} \hline \text { C15,C16,C17,C18,C19,C } \\ 20, \mathrm{C} 21, \mathrm{C} 22, \mathrm{C} 23 \end{gathered}$ | 2200pF | 0603 | CAP, CERM, 2200 pF, $100 \mathrm{~V},+/-10 \%$, X7R, 0603 |
| R3,R4,R5,R6 | 68 ohm | 0603 | ES, 68, 5\%, $0.1 \mathrm{~W}, 0603$ |
| L1,L2,L3,L4 | 300 ohm | 0806 | Ferrite Bead, 300 ohm @ 100 MHz, 3.1 A, 0806 |
| L5 | 100 ohm | 0806 | Ferrite Bead, 100 ohm @ $100 \mathrm{MHz}, 4 \mathrm{~A}, 0806$ |

With Low EMI technology, TAS5805M keeps enough EMI margin for most of application cases where PVDD < 14 V with ferrite bead (Low BOM cost). With Ferrite Bead and capacitor as the output filter, Figure 8-1 and Table 8-3 includes a good configuration (Proper value of Ferrite bead, Capacitor, Resistor) to achieve enough EMI margin for the typical case which PVDD $=12 \mathrm{~V}$, Speaker Load $=8 \Omega / 6 \Omega$, each speaker wire with 1 m length, Output Power $=1 \mathrm{~W} / 4 \mathrm{~W} / 8 \mathrm{~W}$ for each channel.

- Select Ferrite bead (L1~L5). The trade-off is impedance and rated current. If the rated current meet the system's requirement, larger impedance means larger EMI margin for the EMI, especially for the frequency band $5 \mathrm{MHz} \sim 50 \mathrm{MHz}$. The typical ferrite bead recommend for TAS5805M is NFZ2MSM series (Murata) and UPZ2012E series (Sunlord). 300 ohm at 100 MHz ferrite bead is a typical value which can pass EMI for most of application cases.
- Select capacitor (C15~C23). The trade-off is capacitor value and idle current. Larger capacitor means larger idle current, increase the capacitor value from 1 nF to 2.2 nF makes much help for frequency band $5 \mathrm{MHz} \sim 100$ MHz.
- Using Ferrite bead as the output filter, recommend designer to use Fsw $=384 \mathrm{kHz}$ with Spread spectrum enable, BD Modulation, refer to Section 7.4.3.1
- With Ferrite bead as the output power. In order to pass EMI (AC Conducted Emission) standard, an AC to DC adapter with EMI filter in it is needed. For most of applications (TV/Voice Control Speaker/Wireless speaker/ Soundbar) which need a $110 \mathrm{~V} \sim 220 \mathrm{~V}$ power supply usually has a EMI filter in the AC to DC adapter. Some cases use DC power supply and also need to test the DC Conducted Emission, this applications (Automotive/Industry) need a simple EMI filter on PVDD for TAS5805M. Refer to application note: AN-2162 Simple Success With Conducted EMI From DC to DC Converters.

Table 8-4. Supporting Component Requirements for Stereo 2.0 (BTL) system (With Inductor as output filter)

With Inductor as the output filter, designers can achieve ultra low idle current (with Hybrid Modulation or 1SPW Modulation) and keep large EMI margin. As the switching frequency of TAS5805M can be adjustable from 384 kHz to 768 kHz . Higher switching frequency means smaller Inductor value needed.

- With 768 kHz switching frequency. Designers can select $10 \mathrm{uH}+0.68 \mu \mathrm{~F}$ or $4.7 \mu \mathrm{H}+0.68 \mu \mathrm{~F}$ as the output filter, this will help customer to save the Inductor size with the same rated current during the inductor selection. With $4.7 \mathrm{uH}+0.68 \mathrm{uF}$, make sure $\mathrm{PVDD} \leq 12 \mathrm{~V}$ to avoid the large ripple current to trigger the OC threshold (5A).
- With 384 kHZ switching frequency. Designers can select $22 \mu \mathrm{H}+0.68 \mu \mathrm{~F}$ or $15 \mu \mathrm{H}+0.68 \mu \mathrm{~F}$ or $10 \mu \mathrm{H}+0.68$ $\mu \mathrm{F}$ as the output filter, this will help customer to save power dissipation for some battery power supply application. With $10 \mu \mathrm{H}+0.68 \mu \mathrm{~F}$, make sure PVDD $\leq 12 \mathrm{~V}$ to avoid the large ripple current to trigger the OC threshold (5A).

### 8.2.1.2 Detailed Design Procedures

The design procedure can be used for Stereo 2.0, Mono, 2.1 system.

### 8.2.1.2.1 Step 1: Hardware Integration

- Use the Typical Application Schematic as a guide, integrate the hardware into the system schematic.
- Follow the recommended component placement, board layout, and routing given in the example layout above, integrate the device and its supporting components into the system PCB file.
- The most critical sections of the circuit are the power supply inputs, the amplifier output signals, and the high-frequency signals, all of which go to the serial audio port. Constructing these signals to ensure they are given precedent as design trade-offs are made is recommended.
- For questions and support, go to the E2E forums (E2E.ti.com). If deviating from the recommended layout is necessary, go to the E2E forum to request a layout review.

### 8.2.1.2.2 Step 2: Speaker Tuning

Use the TAS5805MEVM evaluation module and the PPC3 app to configure the desired device settings.

### 8.2.1.2.3 Step 3: Software Integration

- Use the End System Integration feature of the PPC3 app to generate a baseline configuration file.
- Generate additional configuration files based upon operating modes of the end-equipment and integrate static configuration information into initialization files.
- Integrate dynamic controls (such as volume controls, mute commands, and mode-based EQ curves) into the main system program.

### 8.2.1.3 Application Curves

### 8.2.1.3.1 Audio Performance

### 8.2.1.3.2 EN55022 Conducted Emissions Results with Ferrite Bead as output filter

With (Ferrite Bead as the output filter), 220 V to 12 V adapter from a major TV customer, $8-\Omega$ speaker, Spread Spectrum Enabled, Stereo Output Power $=8 \mathrm{~W} / \mathrm{CH}, 1$ meter speaker cable for each channel.

### 8.2.1.3.3 EN55022 Radiated Emissions Results with Ferrite Bead as output filter

With (Ferrite Bead as the output filter), 220 V to 12 V adapter from a major TV customer, $8-\Omega$ speaker, Spread Spectrum Enabled, Stereo Output Power $=8 \mathrm{~W} / \mathrm{CH}, 1$ meter speaker cable for each channel.

Figure 8-7. Radiated Emission with Ferrite Bead Filter - Horizontal

| Suspected List |  |  |  |  |  |  |  |  | Polarity |

Figure 8-8. Radiated Emission with Ferrite Bead Filter - Vertical

With Inductor as the output filter, the EMI margin reserve $\geq 15 \mathrm{~dB}$ Margin for both Conducted Emission and Radiated Emission. More data are included in the application note -TAS5805M Design Considerations for EMC.

### 8.2.2 MONO (PBTL) Systems

In MONO mode, TAS5805M can be used as PBTL mode to drive sub-woofer with more output power.

Figure 8-9. Mono (PBTL) System Application Schematic

### 8.2.2.1 Design Requirements

- Power supplies:
- 3.3-V or 1.8-V supply
- 4.5-V to $24-\mathrm{V}$ supply
- Communication: host processor serving as $\mathrm{I}^{2} \mathrm{C}$ compliant master
- External memory (Such as EEPROM and FLASH) used for coefficients

The requirement for the supporting components for the TAS5805M device in a MONO (PBTL) system is provide in Table 8-5

### 8.2.2.2 Detailed Design Procedure

For information about the Detailed Design Procedure, see the Section 8.2.1.2 section.

### 8.2.2.3 Application Curves

Figure 8-10. Efficiency vs Output Power (Inductor as Output Filter, Hybrid modulation, PBTL mode)

Figure 8-11. THD+N vs Output Power (Inductor as Output Filter, Hybrid Modulation, PBTL mode)

### 8.2.3 Advanced 2.1 System (Two TAS5805M Devices)

In higher performance systems, the subwoofer output can be enhanced using digital audio processing as was done in the high-frequency channels. To accomplish this, two TAS5805M devices are used - one for the high frequency left and right speakers and one for the mono subwoofer speaker. In this system, the audio signal can be sent from the TAS5805M device through the SDOUT pin. Alternatively, the subwoofer amplifier can accept the same digital input as the stereo, which might come from a central systems processor. Figure 8-12 shows the 2.1 (Stereo BTL with Two TAS5805M devices) system application.

Figure 8-12. 2.1 (2.1 CH with Two TAS5805M Devices) Application Schematic

## Power Supply Recommendations

The TAS5805M device requires two power supplies for proper operation. A high-voltage supply calls PVDD is required to power the output stage of the speaker amplifier and its associated circuitry. Additionally, one lowvoltage power supply which is calls DVDD is required to power the various low-power portions of the device. The allowable voltage range for both PVDD and DVDD supply are listed in the Recommended Operating Conditions table. Once the device has been initialized, PVDD must keep within the normal operation voltage. Once PVDD lower than 3.5 V , all registers need re-initialize again.

Figure 9-1. Power Supply Function Block Diagram

### 9.1 DVDD Supply

The DVDD supply that is required from the system is used to power several portions of the device. As shown in Figure 9-1, it provides power to the DVDD pin. Proper connection, routing and decoupling techniques are highlighted in the Section 8 section and the Section 9.2 section and must be followed as closely as possible for proper operation and performance.

Some portions of the device also require a separate power supply that is a lower voltage than the DVDD supply. To simplify the power supply requirements for the system, the TAS5805M device includes an integrated low dropout (LDO) linear regulator to create this supply. This linear regulator is internally connected to the DVDD supply and its output is presented on the DVDD_REG pin, providing a connection point for an external bypass capacitor. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

### 9.2 PVDD Supply

The output stage of the speaker amplifier drives the load using the PVDD supply. This is the power supply which provides the drive current to the load during playback. Proper connection, routing, and decoupling techniques are highlighted in the TAS5805MEVM and must be followed as closely as possible for proper operation and performance. Due to the high-voltage switching of the output stage, it is particularly important to properly decouple the output power stages in the manner described in the TAS5805M device Section 8. Lack of proper decoupling, like that shown in the Section 8 , results in voltage spikes which can damage the device.

A separate power supply is required to drive the gates of the MOSFETs used in the output stage of the speaker amplifier. This power supply is derived from the PVDD supply via an integrated linear regulator. A GVDD pin is provided for the attachment of decoupling capacitor for the gate drive voltage regulator. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

Another separate power supply is derived from the PVDD supply via an integrated linear regulator is AVDD. AVDD pin is provided for the attachment of decoupling capacitor for the TAS5805M internal circuitry. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

## 9 Layout

### 9.1 Layout Guidelines

### 9.1.1 General Guidelines for Audio Amplifiers

Audio amplifiers which incorporate switching output stages must have special attention paid to their layout and the layout of the supporting components used around them. The system level performance metrics, including thermal performance, electromagnetic compliance (EMC), device reliability, and audio performance are all affected by the device and supporting component layout.

Ideally, the guidance provided in the applications section with regard to device and component selection can be followed by precise adherence to the layout guidance shown in the Section 9.2 section. These examples represent exemplary baseline balance of the engineering trade-offs involved with lying out the device. These designs can be modified slightly as needed to meet the needs of a given application. In some applications, for instance, solution size can be compromised to improve thermal performance through the use of additional contiguous copper neat the device. Conversely, EMI performance can be prioritized over thermal performance by routing on internal traces and incorporating a via picket-fence and additional filtering components. In all cases, it is recommended to start from the guidance shown in the Section 9.2 section and work with TI field application engineers or through the E2E community to modify it based upon the application specific goals.

### 9.1.2 Importance of PVDD Bypass Capacitor Placement on PVDD Network

Placing the bypassing and decoupling capacitors close to supply has long been understood in the industry. This applies to DVDD, AVDD, GVDD and PVDD. However, the capacitors on the PVDD net for the TAS5805M device deserve special attention.

The small bypass capacitors on the PVDD lines of the DUT must be placed as close to the PVDD pins as possible. Not only dose placing these device far away from the pins increase the electromagnetic interference in the system, but doing so can also negatively affect the reliability of the device. Placement of these components too far from the TAS5805M device can cause ringing on the output pins that can cause the voltage on the output pin to exceed the maximum allowable ratings shown in the Absolute Maximum Ratings table, damaging the deice. For that reason, the capacitors on the PVDD net must be no further away from their associated PVDD pins than what is shown in the example layouts in the Section 9.2 section.

### 9.1.3 Optimizing Thermal Performance

Follow the layout example shown in the Figure 9-1 to achieve the best balance of solution size, thermal, audio, and electromagnetic performance. In some cases, deviation from this guidance can be required due to design constraints which cannot be avoided. In these instances, the system designer should ensure that the heat can get out of the device and into the ambient air surrounding the device. Fortunately, the heat created in the device naturally travels away from the device and into the lower temperature structures around the device.

### 9.1.3.1 Device, Copper, and Component Layout

Primarily, the goal of the PCB design is to minimize the thermal impedance in the path to those cooler structures.
These tips should be followed to achieve that goal:

- Avoid placing other heat producing components or structures near the amplifier (including above or below in the end equipment).
- If possible, use a higher layer count PCB to provide more heat sinking capability for the TAS5805M device and to prevent traces and copper signal and power planes from breaking up the contiguous copper on the top and bottom layer.
- Place the TAS5805M device away from the edge of the PCB when possible to ensure that the heat can travel away from the device on all four sides.
- Avoid cutting off the flow of heat from the TAS5805M device to the surrounding areas with traces or via strings. Instead, route traces perpendicular to the device and line up vias in columns which are perpendicular to the device.
- Unless the area between two pads of a passive component is large enough to allow copper to flow in between the two pads, orient it so that the narrow end of the passive component is facing the TAS5805M device.
- Because the ground pins are the best conductors of heat in the package, maintain a contiguous ground plane from the ground pins to the PCB area surrounding the device for as many of the ground pins as possible.

### 9.1.3.2 Stencil Pattern

The recommended drawings for the TAS5805M device PCB foot print and associated stencil pattern are shown at the end of this document in the package addendum. Additionally, baseline recommendations for the via arrangement under and around the device are given as a starting point for the PCB design. This guidance is provided to suit the majority of manufacturing capabilities in the industry and prioritizes manufacturability over all other performance criteria. In elevated ambient temperature or under high-power dissipation use-cases, this guidance may be too conservative and advanced PCB design techniques may be used to improve thermal performance of the system.

## Note

The customer must verify that deviation from the guidance shown in the package addendum, including the deviation explained in this section, meets the customer's quality, reliability, and manufacturability goals.

### 9.1.3.2.1 PCB footprint and Via Arrangement

The PCB footprint (also known as a symbol or land pattern) communicates to the PCB fabrication vendor the shape and position of the copper patterns to which the TAS5805M device will be soldered. This footprint can be followed directly from the guidance in the package addendum at the end of this data sheet. It is important to make sure that the thermal pad, which connects electrically and thermally to the PowerPAD ${ }^{T M}$ of the TAS5805M device, be made no smaller than what is specified in the package addendum. This ensures that the TAS5805M device has the largest interface possible to move heat from the device to the board.
The via pattern shown in the package addendum provides an improved interface to carry the heat from the device through to the layers of the PCB, because small diameter plated vias (with minimally-sized annular rings) present a low thermal-impedance path from the device into the PCB. Once into the PCB, the heat travels away from the device and into the surrounding structures and air. By increasing the number of vias, as shown in the Section 9.2 section, this interface can benefit from improved thermal performance.

## Note

Vias can obstruct heat flow if they are not constructed properly.
More notes on the construction and placement of vias are as follows:

- Remove thermal reliefs on thermal vias, because they impede the flow of heat through the via.
- Vias filled with thermally conductive material are best, but a simple plated via can be used to avoid the additional cost of filled vias.
- The diameter of the drull must be 8 mm or less. Also, the distance between the via barrel and the surrounding planes should be minimized to help heat flow from the via into the surrounding copper material. In all cases, minimum spacing should be determined by the voltages present on the planes surrounding the via and minimized wherever possible.
- Vias should be arranged in columns, which extend in a line radially from the heat source to the surrounding area. This arrangement is shown in the Section 9.2 section.
- Ensure that vias do not cut off power current flow from the power supply through the planes on internal layers. If needed, remove some vias that are farthest from the TAS5805M device to open up the current path to and from the device.

### 9.1.3.2.2 Solder Stencil

During the PCB assembly process, a piece of metal called a stencil on top of the PCB and deposits solder paste on the PCB wherever there is an opening (called an aperture) in the stencil. The stencil determines the quantity and the location of solder paste that is applied to the PCB in the electronic manufacturing process. In most cases, the aperture for each of the component pads is almost the same size as the pad itself. However, the thermal pad on the PCB is large and depositing a large, single deposition of solder paste would lead to
manufacturing issues. Instead, the solder is applied to the board in multiple apertures, to allow the solder paste to outgas during the assembly process and reduce the risk of solder bridging under the device. This structure is called an aperture array, and is shown in the Section 9.2 section. It is important that the total area of the aperture array (the area of all of the small apertures combined) covers between $70 \%$ and $80 \%$ of the area of the thermal pad itself.

## 10 Device and Documentation Support

### 10.1 Device Support

### 10.1.1 Device Nomenclature

The glossary is general commonly used acronyms and words which are defined in accordance with a broad TI initiative to comply with industry standards such as JEDEC, IPC, IEEE, and others. The glossary provided in this section defines words, phrases, and acronyms that are unique to this product and documentation, collateral, or support tools and software used with this product. For any additional questions regarding definitions and terminology, please see the e2e Audio Amplfier Forum.

Bridge tied load (BTL) is an output configuration in which one terminal of the speaker is connected to one halfbridge and the other terminal is connected to another half-bridge.
DUT refers to a device under test to differentiate one device from another.
Closed-loop architecture describes a topology in which the amplifier monitors the output terminals, comparing the output signal to the input signal and attempts to correct for non-linearities in the output.
Dynamic controls are those which are changed during normal use by either the system or the end-user.
GPIO is a general purpose input/output pin. It is a highly configurable, bi-directional digital pin which can perform many functions as required by the system.

Host processor (also known as System Processor, Scalar, Host, or System Controller) refers to device which serves as a central system controller, providing control information to devices connected to it as well as gathering audio source data from devices upstream from it and distributing it to other devices. This device often configures the controls of the audio processing devices (like the TAS5805M) in the audio path in order to optimize the audio output of a loudspeaker based on frequency response, time alignment, target sound pressure level, safe operating area of the system, and user preference.
Maximum continuous output power refers to the maximum output power that the amplifier can continuously deliver without shutting down when operated in a $25^{\circ} \mathrm{C}$ ambient temperature. Testing is performed for the period of time required that their temperatures reach thermal equilibrium and are no longer increasing
Parallel bridge tied load (PBTL) is an output configuration in which one terminal of the speaker is connected to two half-bridges which have been placed in parallel and the other terminal is connected to another pair of half bridges placed in parallel
$r_{D S(o n)}$ is a measure of the on-resistance of the MOSFETs used in the output stage of the amplifier.
Static controls/Static configurations are controls which do not change while the system is in normal use.
Vias are copper-plated through-hole in a PCB.
10.1.2 Development Support

### 10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 10.3 Support Resources

TI E2E ${ }^{\text {TM }}$ support forums are an engineer's go-to source for fast, verified answers and design help - straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

### 10.4 Trademarks

PowerPAD ${ }^{T M}$ and TI E2E ${ }^{\text {TM }}$ are trademarks of Texas Instruments.
All trademarks are the property of their respective owners.

### 10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.6 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TAS5805MPWP | ACTIVE | HTSSOP | PWP | 28 | 50 | RoHS \& Green | NIPDAU | Level-3-260C-168 HR | -25 to 85 | 5805 | Samples |
| TAS5805MPWPR | ACTIVE | HTSSOP | PWP | 28 | 2000 | RoHS \& Green | NIPDAU | Level-3-260C-168 HR | -25 to 85 | 5805 | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as " Pb -Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000 \mathrm{ppm}$ threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

SEE DETAIL

4224480/A 08/2018
NOTES:
PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may differ or may not be present.

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL SCALE: 8X

| STENCIL <br> THICKNESS | SOLDER STENCIL <br> OPENING |
| :---: | :---: |
| 0.1 | $3.47 \times 4.53$ |
| 0.125 | $3.10 \times 4.05($ SHOWN $)$ |
| 0.15 | $2.83 \times 3.70$ |
| 0.175 | $2.62 \times 3.42$ |

NOTES: (continued)
11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.
