

# TPS3430

## Window Watchdog Timer with Programmable Reset Delay

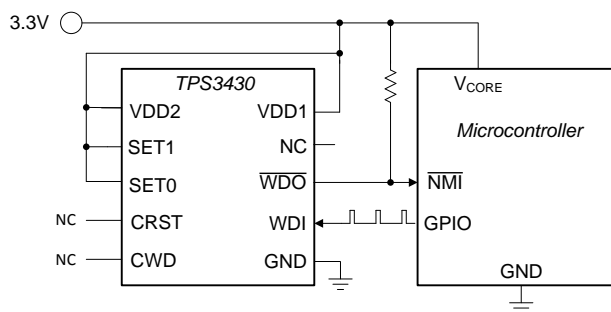

### 1 Features

- Factory-Programmed Precision Watchdog Timers:
  - ±15% Accurate Watchdog Timeout and Watchdog Reset Delays Over Temperature
  - ±2.5% Accurate Watchdog Timeout and Watchdog Reset Delays Typical at 25°C
- Watchdog Disable Feature
- User-Programmable Watchdog Timeout
- User-Programmable Watchdog Reset Delay
- Input Voltage Range: VDD = 1.6 V to 6.5 V
- Low Supply Current: I<sub>DD</sub> = 10 µA (typical)
- Open-Drain Output
- Small 3-mm × 3-mm, 10-Pin VSON Package
- Junction Operating Temperature Range: –40°C to +125°C

### 2 Applications

- Video Surveillance
- Sensor Transmitters
- HVAC (Thermostats)
- Fire Safety (Heat and Smoke Detectors)
- Medical (Personal Care and Fitness)
- FPGA and ASIC Applications
- Microcontroller and DSP Applications

#### Window Watchdog Timer Circuit

### 3 Description

The TPS3430 is a standalone window watchdog timer with programmable watchdog window and programmable watchdog reset delay for a wide variety of applications. The TPS3430 window watchdog achieves 15% timing accuracy (–40°C to +125°C), 2.5% timing accuracy (typical at 25°C) and the watchdog output (WDO) reset delay can be set by factory-programmed default delay settings, or programmed by an external capacitor. The watchdog can be disabled via the SET pins to avoid undesired watchdog timeouts during the development process or during power on.

The TPS3430 is available in a small 3.00-mm × 3.00-mm, 10-pin VSON package.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS3430	VSON (10)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

#### Normalized Watchdog Timeout Accuracy Over Temperature (SET0 = 1, SET1 = 1, CWD = NC)

## 5 Pin Configuration and Functions

**DRC Package  
3-mm × 3-mm VSON-10  
Top View**

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
VDD1	1	I	Supply voltage pin. For noisy systems, connecting a 0.1- $\mu$ F bypass capacitor is recommended.
CWD	2	I	Programmable watchdog timeout input. Watchdog timeout is set by connecting a capacitor between this pin and ground. Furthermore, this pin can also be connected by a 10-k $\Omega$ resistor to VDD, or leaving unconnected (NC) further enables the selection of the preset watchdog timeouts; see the <a href="#">Timing Requirements</a> table. When using a capacitor, the TPS3430 determines the window watchdog upper boundary with <a href="#">Equation 4</a> . The lower watchdog boundary is set by the SET pins, see <a href="#">Table 6</a> and the <a href="#">CWD Functionality</a> section for additional information.
SET0	3	I	Logic input. SET0, SET1, and CWD select the watchdog window ratios, timeouts, and disable the watchdog; see the <a href="#">Timing Requirements</a> table.
CRST	4	I	Programmable watchdog reset delay pin. Connect a capacitor between this pin and GND to program the watchdog reset delay period. This pin can also be connected by a 10-k $\Omega$ pull-up resistor to VDD, or left unconnected (NC) for various factory programmed watchdog reset delay options; see the <a href="#">CRST Delay</a> section. When using an external capacitor, use <a href="#">Equation 1</a> to determine the watchdog reset delay.
GND	5	—	Ground pin
SET1	6	I	Logic input. SET0, SET1, and CWD select the watchdog window ratios, timeouts, and disable the watchdog; see the <a href="#">Timing Requirements</a> table.
WDI	7	I	Watchdog input. A falling transition (edge) must occur at this pin within the watchdog timeout between the lower ( $t_{WDL(max)}$ ) and upper ( $t_{WDU(min)}$ ) window boundaries in order for $\overline{WDO}$ to not assert. During power up, all pulses to WDI are ignored before $t_{RST}$ expires and the watchdog is disabled. When the watchdog is not in use, the SET pins can be used to disable the watchdog. The input at WDI is ignored when $\overline{WDO}$ is low (asserted) and also when the watchdog is disabled. If the watchdog is disabled, then WDI cannot be left unconnected and must be driven to either VDD or GND.
$\overline{WDO}$	8	O	Watchdog open-drain active-low output. Connect $\overline{WDO}$ with a 1-k $\Omega$ to 100-k $\Omega$ resistor to VDD or another power supply. $\overline{WDO}$ goes low (asserts) when a watchdog timeout occurs. When a watchdog timeout occurs, $\overline{WDO}$ goes low (asserts) for the set $\overline{WDO}$ reset delay ( $t_{RST}$ ). When the watchdog is disabled, $\overline{WDO}$ remains logic high regardless of WDI.
NC	9	NC	This pin is no-connect and should be left floating.
VDD2	10	I	Connect this pin to VDD1. The device will not function properly if VDD1 and VDD2 are not externally connected.
Thermal pad		—	Connect the thermal pad to a large-area ground plane. The thermal pad is internally connected to GND.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage range	VDD1, VDD2	-0.3	7	V
Output voltage range	$\overline{WDO}$	-0.3	7	V
Voltage ranges	SET0, SET1, WDI,	-0.3	7	V
	CWD, CRST	-0.3	VDD + 0.3 <sup>(2)</sup>	
Output pin current	$\overline{WDO}$		±20	mA
Input current (all pins)			±20	mA
Continuous total power dissipation		See <a href="#">Thermal Information</a>		
Temperature	Operating junction, T <sub>J</sub> <sup>(3)</sup>	-40	150	°C
	Operating free-air temperature, T <sub>A</sub> <sup>(3)</sup>	-40	150	
	Storage, T <sub>stg</sub>	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The absolute maximum rating is V<sub>DD</sub> + 0.3 V or 7.0 V, whichever is smaller.
- (3) T<sub>J</sub> = T<sub>A</sub> as a result of the low dissipated power in this device.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD1, VDD2	Supply pin voltage	1.6		6.5	V
V <sub>SET0</sub>	SET0 pin voltage	0		6.5	V
V <sub>SET1</sub>	SET1 pin voltage	0		6.5	V
C <sub>CRST</sub>	WD reset delay capacitor	0.1 <sup>(1)</sup>		1000 <sup>(1)</sup>	nF
R <sub>CRST</sub>	Pull-up resistor to VDD	9	10	11	kΩ
C <sub>CWD</sub>	Watchdog timing capacitor	0.1 <sup>(2)</sup>		1000 <sup>(2)</sup>	nF
CWD	Pull-up resistor to VDD	9	10	11	kΩ
R <sub>PU</sub>	Pull-up resistor, $\overline{WDO}$	1	10	100	kΩ
I <sub>WDO</sub>	Watchdog output current			10	mA
T <sub>J</sub>	Junction Temperature	-40		125	°C

- (1) Using a C<sub>CRST</sub> capacitor of 0.1 nF or 1000 nF gives a reset delay of 703 μs or 3.22 seconds, respectively.
- (2) Using a C<sub>CWD</sub> capacitor of 0.1 nF or 1000 nF gives a t<sub>WDO(typ)</sub> of 62.74 ms or 77.45 seconds, respectively.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS3430	UNIT
		DRC (VSON)	
		10 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	50.9	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	50.6	
R <sub>θJB</sub>	Junction-to-board thermal resistance	25.4	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.2	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	25.5	
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	7.3	

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

at 1.6 V ≤ V<sub>DD</sub> ≤ 6.5 V over the operating temperature range of –40°C ≤ T<sub>J</sub> ≤ +125°C (unless otherwise noted); typical values are at T<sub>J</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>GENERAL CHARACTERISTICS</b>						
V <sub>DD1</sub> , V <sub>DD2</sub> (1) (2)	Supply voltage		1.6		6.5	V
I <sub>DD</sub>	Supply current			10	19	μA
V <sub>POR</sub> <sup>(3)</sup>	Power-on reset voltage	V <sub>OL(MAX)</sub> = 0.25 V			0.8	V
I <sub>CRST</sub>	CRST pin charge current	CRST = 0.5 V	337	375	413	nA
V <sub>CRST</sub>	CRST pin threshold voltage		1.192	1.21	1.228	V
<b>WINDOW WATCHDOG FUNCTION</b>						
I <sub>CWD</sub>	CWD pin charge current	CWD = 0.5 V	337	375	413	nA
V <sub>CWD</sub>	CWD pin threshold voltage		1.192	1.21	1.228	V
V <sub>OL</sub>	$\overline{WDO}$ output low	V <sub>DD</sub> = 5 V, I <sub>SINK</sub> = 3 mA			0.4	V
I <sub>D</sub>	$\overline{WDO}$ output leakage current	V <sub>DD</sub> = 1.6 V, V $\overline{WDO}$ = 6.5 V			1	μA
V <sub>IL</sub>	Low-level input voltage (SET0, SET1)				0.25	V
V <sub>IH</sub>	High-level input voltage (SET0, SET1)		0.8			V
V <sub>IL(WDI)</sub>	$\overline{WDO}$ output low				0.3 × V <sub>DD</sub>	V
V <sub>IH(WDI)</sub>	$\overline{WDO}$ output leakage current		0.8 × V <sub>DD</sub>			V

(1) When V<sub>DD</sub> falls below V<sub>UVLO</sub>, WDI is ignored

(2) During power-on, V<sub>DD</sub> must be a minimum 1.6 V for at least 300 μs.

(3) When V<sub>DD</sub> falls below V<sub>POR</sub>,  $\overline{WDO}$  is undefined.

## 6.6 Timing Requirements

at  $1.6\text{ V} \leq V_{DD} \leq 6.5\text{ V}$  over the operating temperature range of  $-40^\circ\text{C} \leq T_A, T_J \leq +125^\circ\text{C}$  (unless otherwise noted); the open-drain pullup resistors are 10 kΩ for each output; typical values are at  $T_J = 25^\circ\text{C}$

			MIN	TYP	MAX	UNIT
<b>GENERAL</b>						
$t_{INIT}$	CWD, CRST pin evaluation period			381		μs
$t_{SET}$	Time required between changing SET0 and SET1 pins			500		μs
	SET0, SET1 pin setup time			1		μs
	Startup delay <sup>(1)</sup>			300		μs
<b>DELAY FUNCTION</b>						
$t_{RST}$	Watchdog reset delay	CRST = NC	170	200	230	ms
		CRST = 10 kΩ to VDD	8.5	10	11.5	ms
<b>WINDOW WATCHDOG FUNCTION</b>						
WD ratio	Window watchdog ratio of lower boundary to upper boundary	CWD = programmable, SET0 = 0, SET1 = 0 <sup>(2)</sup>	1/8			
		CWD = programmable, SET0 = 1, SET1 = 1 <sup>(2)</sup>	1/2			
		CWD = programmable, SET0 = 0, SET1 = 1 <sup>(2) (3)</sup>	3/4			
$t_{WDL}$	Window watchdog lower boundary	CWD = NC, SET0 = 0, SET1 = 0	19.1	22.5	25.9	ms
		CWD = NC, SET0 = 0, SET1 = 1	1.5	1.85	2.2	ms
		CWD = NC, SET0 = 1, SET1 = 0	Watchdog disabled			
		CWD = NC, SET0 = 1, SET1 = 1	680	800	920	ms
		CWD = 10 kΩ to VDD, SET0 = 0, SET1 = 0	7.7	9.0	10.4	ms
		CWD = 10 kΩ to VDD, SET0 = 0, SET1 = 1	7.7	9.0	10.4	ms
		CWD = 10 kΩ to VDD, SET0 = 1, SET1 = 0	Watchdog disabled			
		CWD = 10 kΩ to VDD, SET0 = 1, SET1 = 1	1.5	1.85	2.2	ms
$t_{WDU}$	Window watchdog upper boundary	CWD = NC, SET0 = 0, SET1 = 0	46.8	55.0	63.3	ms
		CWD = NC, SET0 = 0, SET1 = 1	22.0	27.5	33.0	ms
		CWD = NC, SET0 = 1, SET1 = 0	Watchdog disabled			
		CWD = NC, SET0 = 1, SET1 = 1	1360	1600	1840	ms
		CWD = 10 kΩ to VDD, SET0 = 0, SET1 = 0	92.7	109.0	125.4	ms
		CWD = 10 kΩ to VDD, SET0 = 0, SET1 = 1	165.8	195.0	224.3	ms
		CWD = 10 kΩ to VDD, SET0 = 1, SET1 = 0	Watchdog disabled			
		CWD = 10 kΩ to VDD, SET0 = 1, SET1 = 1	8.8	11.0	13.2	ms
$t_{WD-setup}$	Setup time required for device to respond to changes on WDI after being enabled			150		μs
	Minimum WDI pulse duration			50		ns
$t_{WD-del}$	WDI to $\overline{WDO}$ delay			50		ns

- (1) During power-on, VDD must be a minimum 1.6 V for at least 300 μs
- (2) 0 refers to  $V_{SET} \leq V_{IL}$ , 1 refers to  $V_{SET} \geq V_{IH}$ .
- (3) If this watchdog ratio is used, then  $t_{WDL}(\text{max})$  can overlap  $t_{WDU}(\text{min})$ .

(1) See Figure 2 for WDI timing requirements.

## 7 Detailed Description

### 7.1 Overview

The TPS3430 is a high-accuracy programmable window watchdog timer with watchdog disable feature that achieves 15% watchdog timing accuracy over the specified temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

### 7.2 Functional Block Diagrams

(1) VDD1 and VDD2 are not internally connected and must be connected externally for the device to function.

**Figure 8. TPS3430 Block Diagram**

### 7.3 Feature Description

#### 7.3.1 CRST

The CRST pin provides the user the functionality of both high-precision, factory-programmed watchdog reset delay timing options and user-programmable watchdog reset delay timing. The CRST pin can be pulled up to VDD through a resistor, have an external capacitor to ground, or can be left unconnected. The configuration of the CRST pin is re-evaluated by the device every time the voltage on VDD comes up. The pin evaluation is controlled by an internal state machine that determines which option is connected to the CRST pin. The sequence of events takes  $381\ \mu\text{s}$  ( $t_{\text{INIT}}$ ) to determine if the CRST pin is left unconnected, pulled up through a resistor, or connected to a capacitor. If the CRST pin is being pulled up to VDD, then a 10-k $\Omega$  pull-up resistor is required.

## Feature Description (continued)

### 7.3.2 Window Watchdog

#### 7.3.2.1 SET0 and SET1

When changing the SET0 or SET1 pins, there are two cases to consider: enabling and disabling the watchdog, and changing the SET0 or SET1 pins when the watchdog is enabled. In case 1 where the watchdog is being enabled or disabled, the changes take effect immediately. However, in case 2, a  $\overline{WDO}$  fault event must occur in order for the changes to take place.

##### 7.3.2.1.1 Enabling the Window Watchdog

The TPS3430 features the ability to enable and disable the watchdog timer. This feature allows the user to start with the watchdog timer disabled and then enable the watchdog timer using the SET0 and SET1 pins. The ability to enable and disable the watchdog is useful to avoid undesired watchdog trips during initialization and shutdown. When the SETx pins are changed to disable the watchdog timer, changes on the pins are responded to immediately (as shown in Figure 9). When the watchdog goes from disabled to enabled, there is a 150  $\mu\text{s}$  ( $t_{WD-setup}$ ) transition period where the device does not respond to changes on WDI. After this 150- $\mu\text{s}$  period, the device begins to respond to changes on WDI again.

Figure 9. Enabling the Watchdog Timer

##### 7.3.2.1.2 Disabling the Watchdog Timer When Using the CRST Capacitor

When using the TPS3430 with fixed timing options, if the watchdog is disabled and reenabled while  $\overline{WDO}$  is asserted (logic low) the watchdog performs as described in the [Enabling the Window Watchdog](#) section. However, if there is a capacitor on the CRST pin, and the watchdog is disabled and reenabled when  $\overline{WDO}$  is asserted (logic low), then the watchdog behaves as shown in Figure 10. When the watchdog is disabled,  $\overline{WDO}$  goes high impedance (logic high). However, when the watchdog is enabled again, the  $t_{RST}$  period must expire before the watchdog resumes normal operation.

Feature Description (continued)

NOTE: There is no WDI signal in this figure, WDI is always at GND.

Figure 10. Enabling and Disabling the Watchdog Timer During a WDO Reset Event

7.3.2.1.3 SET0 and SET1 During Normal Watchdog Operation

The SET0 and SET1 pins can be used to control the window watchdog ratio of the lower boundary to the upper boundary. There are four possible modes for the watchdog (see Table 6): disabled, 1:8 ratio, 3:4 ratio, and 1:2 ratio. If SET0 = 1 and SET1 = 0, then the watchdog is disabled. When the watchdog is disabled  $\overline{WDO}$  does not assert, and the TPS3430 ignores all inputs to WDI. The SET0 and SET1 pins can be changed when the device is operational, but cannot be changed at the same time. If these pins are changed when the device is operational, then there must be a 500- $\mu$ s ( $t_{SET}$ ) delay between switching the two pins. If the SET0 and SET1 are used to change the reset timing, then a reset event must occur before the new timing is latched. This reset can be triggered by bringing VDD below  $V_{UVLO}$ . Figure 11 shows how the SET0 and SET1 pins do not change the watchdog timing option until a reset event has occurred.

Figure 11. Changing SET0 and SET1 Pins

## Feature Description (continued)

### 7.3.3 Window Watchdog Timer

This section provides information for the window watchdog modes of operation. A window watchdog is typically employed in safety critical applications where a traditional watchdog timer is inadequate. In a traditional watchdog, there is a maximum time in which a pulse must be issued to prevent the reset from occurring. However, in a window watchdog the pulse must be issued between a maximum lower window time ( $t_{WDL(max)}$ ) and the minimum upper window time ( $t_{WDU(min)}$ ) set by the CWD pin and the SET0 and SET1 pins. Table 6 describes how  $t_{WDU}$  can be used to calculate the timing of  $t_{WDL}$ . The  $t_{WDL}$  timing can also be changed by adjusting the SET0 and SET1 pins. Figure 12 shows the valid region for a WDI pulse to be issued to prevent the WDO from being triggered and being pulled low.

Figure 12. TPS3430 Window Watchdog Timing

## Feature Description (continued)

### 7.3.3.1 CWD

The CWD pin provides the user the functionality of both high-precision, factory-programmed watchdog timeout options and user-programmable watchdog timeout. The TPS3430 features three options for setting the watchdog window: connecting a capacitor to the CWD pin, connecting CWD to a pull-up resistor to VDD, and leaving the CWD pin unconnected. The configuration of the CWD pin is evaluated by the device every time the voltage on VDD rises above  $V_{DD(min)}$ . The pin evaluation is controlled by an internal state machine that determines which option is connected to the CWD pin. The sequence of events takes 381  $\mu\text{s}$  ( $t_{INIT}$ ) to determine if the CWD pin is left unconnected, pulled up through a resistor, or connected to a capacitor. If the CWD pin is being pulled up to VDD using a pull-up resistor, then a 10-k $\Omega$  resistor is required.

### 7.3.3.2 WDI Functionality

WDI is the watchdog timer input that controls the  $\overline{WDO}$  output. The WDI input is triggered by the falling edge of the input signal. For the first pulse, the watchdog acts as a traditional watchdog timer; thus, the first pulse must be issued before  $t_{WDU(min)}$ . After the first pulse, to ensure proper functionality of the watchdog timer, always issue the WDI pulse within the window of  $t_{WDL(max)}$  and  $t_{WDU(min)}$ . If the pulse is issued in this region, then  $\overline{WDO}$  remains unasserted. Otherwise, the device asserts  $\overline{WDO}$ , putting the  $\overline{WDO}$  pin into a low-impedance state.

The watchdog input (WDI) is a digital pin. In order to ensure there is no increase in  $I_{DD}$ , drive the WDI pin to either VDD or GND at all times. Putting the pin to an intermediate voltage can cause an increase in supply current ( $I_{DD}$ ) because of the architecture of the digital logic gates. When  $\overline{WDO}$  is asserted, the watchdog is disabled and all signals input to WDI are ignored until the  $\overline{WDO}$  reset delay expires. When  $\overline{WDO}$  is no longer asserted, the device resumes normal operation and no longer ignores the signal on WDI. If the watchdog is disabled, drive the WDI pin to either VDD or GND.

### 7.3.3.3 $\overline{WDO}$ Functionality

The TPS3430 features a programmable window watchdog timer with an programmable watchdog output ( $\overline{WDO}$ ). The watchdog output can flag a fault whenever the watchdog input is outside of the watchdog window. When  $\overline{WDO}$  is not asserted (high), the  $\overline{WDO}$  signal maintains normal operation. When asserted,  $\overline{WDO}$  remains down for  $t_{RST}$  and WDI is ignored during the watchdog reset delay. When the watchdog is disabled,  $\overline{WDO}$  remains high regardless of WDI.

## 7.4 Device Functional Modes

Table 1 summarizes the functional modes of the TPS3430.

**Table 1. Device Functional Modes**

VDD	WDI	$\overline{\text{WDO}}$
$V_{DD} < V_{POR}$	—	—
$V_{POR} < V_{DD} < V_{DD(min)}$	Ignored	High
$V_{DD} \geq V_{DD(min)}$	$t_{WDL(max)} \leq t_{pulse}^{(1)} \leq t_{WDU(min)}$	High
	$t_{WDL(max)} > t_{pulse}^{(1)}$	Low
	$t_{WDU(min)} < t_{pulse}^{(1)}$	Low

(1) Where  $t_{pulse}$  is the time between falling edges on WDI.

### 7.4.1 $V_{DD}$ is Below $V_{POR}$ ( $V_{DD} < V_{POR}$ )

When  $V_{DD}$  is less than  $V_{POR}$ ,  $\overline{\text{WDO}}$  is undefined and can be either high or low. The state of  $\overline{\text{WDO}}$  largely depends on the load that the  $\overline{\text{WDO}}$  pin is experiencing.

### 7.4.2 $V_{DD}$ is Above $V_{POR}$ And Below $V_{DD(min)}$ ( $V_{POR} < V_{DD} < V_{DD(min)}$ )

When  $V_{DD}$  is above  $V_{POR}$  and below  $V_{DD(min)}$ , the watchdog is disabled,  $\overline{\text{WDO}}$  is logic high and WDI is ignored.

### 7.4.3 Normal Operation ( $V_{DD} \geq V_{DD(min)}$ )

When  $V_{DD}$  is greater than or equal to  $V_{DD(min)}$ , the  $\overline{\text{WDO}}$  signal is determined by WDI if the watchdog is enabled. During power up, the watchdog is disabled until  $t_{RST}$  expires. While the watchdog is enabled, the first falling edge on WDI must occur before  $t_{WDU(max)}$  to prevent  $\overline{\text{WDO}}$  from asserting. If the first falling edge on WDI occurs after  $t_{WDU(max)}$ ,  $\overline{\text{WDO}}$  is asserted (active and low) for  $t_{RST}$ . If any falling edge after the first falling edge occurs on WDI before  $t_{WDU(min)}$  or after  $t_{WDU(max)}$ ,  $\overline{\text{WDO}}$  is asserted (active and low) for  $t_{RST}$ .

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The following sections describe in detail proper device implementation, depending on the final application requirements.

#### 8.1.1 CRST Delay

The TPS3430 features three options for setting the reset delay ( $t_{RST}$ ): connecting a capacitor to the CRST pin, connecting a pull-up resistor to VDD, and leaving the CRST pin unconnected. Figure 13 shows a schematic drawing of all three options. To determine which option is connected to the CRST pin, an internal state machine controls the internal pulldown device and measures the pin voltage. This sequence of events takes 381  $\mu$ s ( $t_{INIT}$ ) to determine which timing option is used. Every time WDO is asserted, the state machine determines what is connected to the pin.

Figure 13. CRST Charging Circuit

##### 8.1.1.1 Factory-Programmed Watchdog Reset Delay Timing

To use the factory-programmed timing options, the CRST pin must either be left unconnected or pulled up to VDD through a 10-k $\Omega$  pull-up resistor. Using these options enables a high-precision, 15% accurate reset delay timing, as shown in Table 2.

Table 2. Watchdog Reset Delay Time for Factory-Programmed Timing

CRST	WDO DELAY TIME ( $t_{RST}$ )			UNIT
	MIN	TYP	MAX	
NC	170	200	230	ms
10 k $\Omega$ to VDD	8.5	10	11.5	ms

### 8.1.1.2 CRST Programmable Watchdog Reset Delay

The TPS3430 uses a CRST pin charging current ( $I_{CRST}$ ) of 375 nA. When using an external capacitor, the rising WDO delay time can be set to any value between 700  $\mu$ s ( $C_{CRST} = 100$  pF) and 3.2 seconds ( $C_{CRST} = 1$   $\mu$ F). The typical ideal capacitor value needed for a given delay time can be calculated using Equation 1, where  $C_{CRST}$  is in microfarads and  $t_{RST}$  is in seconds:

$$t_{RST} = 3.22 \times C_{CRST} + 0.000381 \quad (1)$$

To calculate the minimum and maximum watchdog reset delay time use Equation 2 and Equation 3, respectively.

$$t_{RST(min)} = 2.8862 \times C_{CRST} + 0.000324 \quad (2)$$

$$t_{RST(max)} = 3.64392 \times C_{CRST} + 0.000438 \quad (3)$$

The slope of Equation 1 is determined by the time the CRST charging current ( $I_{CRST}$ ) takes to charge the external capacitor up to the CRST comparator threshold voltage ( $V_{CRST}$ ). When  $\overline{WDO}$  is asserted, the capacitor is discharged through the internal CRST pulldown resistor. When the  $\overline{WDO}$  conditions are cleared, the internal precision current source is enabled and begins to charge the external capacitor; when  $V_{CRST} = 1.21$  V,  $\overline{WDO}$  is unasserted. Note that in order to minimize the difference between the calculated  $\overline{WDO}$  delay time and the actual  $\overline{WDO}$  delay time, use a high-quality ceramic dielectric COG, X5R, or X7R capacitor and minimize parasitic board capacitance around this pin. Table 3 lists the watchdog reset delay time ideal capacitor values for  $C_{CRST}$ .

Table 3. Watchdog Reset Delay Time for Common Ideal Capacitor Values

$C_{CRST}$	$\overline{WDO}$ DELAY TIME ( $t_{RST}$ )			UNIT
	MIN <sup>(1)</sup>	TYP	MAX <sup>(1)</sup>	
100 pF	0.67	0.70	0.75	ms
1 nF	3.27	3.61	4.02	ms
10 nF	29.2	32.6	36.8	ms
100 nF	289	323	364	ms
1 $\mu$ F	2886	3227	3644	ms

(1) Minimum and maximum values are calculated using ideal capacitors.

### 8.1.2 CWD Functionality

The TPS3430 features three options for setting the watchdog window: connecting a capacitor to the CWD pin, connecting a pull-up resistor to VDD, and leaving the CWD pin unconnected. Figure 14 shows a schematic drawing of all three options. If this pin is connected to VDD through a 10-k $\Omega$  pull-up resistor or left unconnected (high impedance), then the factory-programmed watchdog timeouts are enabled; see the [Timing Requirements](#) table. Otherwise, the watchdog timeout can be adjusted by placing a capacitor from the CWD pin to ground.

Figure 14. CWD Charging Circuit

### 8.1.2.1 Factory-Programmed Timing Options

If using the factory-programmed timing options (listed in Table 4), the CWD pin must either be unconnected or pulled up to VDD through a 10-kΩ pull-up resistor. Using these options enables high-precision, factory-programmed watchdog timing.

**Table 4. Factory-Programmed Watchdog Timing**

INPUT			WATCHDOG LOWER BOUNDARY (t <sub>WDL</sub> )			WATCHDOG UPPER BOUNDARY (t <sub>WDU</sub> )			UNIT
CWD	SET0	SET1	MIN	TYP	MAX	MIN	TYP	MAX	
NC	0	0	19.1	22.5	25.9	46.8	55.0	63.3	ms
	0	1	1.5	1.85	2.2	22.0	27.5	33.0	ms
	1	0	Watchdog disabled			Watchdog disabled			
	1	1	680	800	920	1360	1600	1840	ms
10 kΩ to VDD	0	0	7.7	9.0	10.4	92.7	109.0	125.4	ms
	0	1	7.7	9.0	10.35	165.8	195.0	224.3	ms
	1	0	Watchdog disabled			Watchdog disabled			
	1	1	1.5	1.85	2.2	8.8	11.0	13.2	ms

### 8.1.2.2 CWD Adjustable Capacitor Watchdog Timeout

Adjustable capacitor timing is achievable by connecting a capacitor to the CWD pin. If a capacitor is connected to CWD, then a 375-nA constant-current source charges C<sub>CWD</sub> until V<sub>CWD</sub> = 1.21 V. The TPS3430 determines the window watchdog upper boundary with the formula given in Equation 4, where C<sub>CWD</sub> is in microfarads and t<sub>WDU</sub> is in seconds.

$$t_{WDU(yp)} = 77.4 \times C_{CWD} + 0.055 \tag{4}$$

The TPS3430 is designed and tested using C<sub>CWD</sub> capacitors between 100 pF and 1 μF. Note that Equation 4 is for ideal capacitors, capacitor tolerances cause the actual device timing to vary. For the most accurate timing, use ceramic capacitors with COG dielectric material. As shown in Table 5, when using the minimum capacitor of 100 pF, the watchdog upper boundary is 62.74 ms; whereas with a 1-μF capacitor, the watchdog upper boundary is 77.455 seconds. If a C<sub>CWD</sub> capacitor is used, Equation 4 can be used to set t<sub>WDU</sub> the window watchdog upper boundary. The window watchdog lower boundary is dependent on the SET0 and SET1 pins because these pins set the window watchdog ratio of the lower boundary to upper boundary; Table 6 shows how t<sub>WDL</sub> can be used to calculate t<sub>WDL</sub> based on the SET0 and SET1 pins.

**Table 5. t<sub>WDU</sub> Values for Common Ideal Capacitor Values**

C <sub>CWD</sub>	WATCHDOG UPPER BOUNDARY (t <sub>WDU</sub> )			UNIT
	MIN <sup>(1)</sup>	TYP	MAX <sup>(1)</sup>	
100 pF	53.32	62.74	72.15	ms
1 nF	112.5	132.4	152.2	ms
10 nF	704	829	953	ms
100 nF	6625	7795	8964	ms
1 μF	65836	77455	89073	ms

(1) Minimum and maximum values are calculated using ideal capacitors.

**Table 6. Programmable CWD Timing**

INPUT			WATCHDOG LOWER BOUNDARY (t <sub>WDL</sub> )			WATCHDOG UPPER BOUNDARY (t <sub>WDU</sub> )			UNIT
CWD	SET0	SET1	MIN	TYP	MAX	MIN	TYP	MAX	
C <sub>CWD</sub>	0	0	t <sub>WDU(min)</sub> × 0.125	t <sub>WDU</sub> × 0.125	t <sub>WDU(max)</sub> × 0.125	0.85 × t <sub>WDU(yp)</sub>	t <sub>WDU(yp)</sub> <sup>(1)</sup>	1.15 × t <sub>WDU(yp)</sub>	s
	0	1	t <sub>WDU(min)</sub> × 0.75	t <sub>WDU</sub> × 0.75	t <sub>WDU(max)</sub> × 0.75	0.85 × t <sub>WDU(yp)</sub>	t <sub>WDU(yp)</sub> <sup>(1)</sup>	1.15 × t <sub>WDU(yp)</sub>	s
	1	0	Watchdog disabled			Watchdog disabled			
	1	1	t <sub>WDU(min)</sub> × 0.5	t <sub>WDU</sub> × 0.5	t <sub>WDU(max)</sub> × 0.5	0.85 × t <sub>WDU(yp)</sub>	t <sub>WDU(yp)</sub> <sup>(1)</sup>	1.15 × t <sub>WDU(yp)</sub>	s

(1) Calculated from Equation 4 using ideal capacitors.

## 8.2 Typical Applications

### 8.2.1 Monitoring Microcontroller with Watchdog Timer - Design 1

A basic application for the TPS3430 is shown in [Figure 20](#). The TPS3430 is used to monitor the activity of the microcontroller via the WDI pin. Design 1 utilizes the simplest TPS3430 configuration with factory-programmed timing options by leaving the CRST and CWD timing pins floating (NC - no connect)

Figure 15. Monitoring Microcontroller using a Window Watchdog Timer

#### 8.2.1.1 Design Requirements - Design 1

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Watchdog Reset delay	Reset delay of 200 ms	Use factory-programmed timing option by leaving CRST as NC. Watchdog reset delay: 170 ms (min), 200 ms (typ), 230 ms (max)
Watchdog window	Functions with a 1-Hz pulse-width modulation (PWM) signal with a 20% duty cycle	Leaving the CWD pin unconnected with SET0 = 1 and SET1 = 1 produces a window with a $t_{WDL(max)}$ of 920 ms and a $t_{WDU(min)}$ of 1360 ms
Output logic voltage	3.3-V Open-Drain	3.3-V Open-Drain
Maximum device current consumption	200 $\mu$ A	10 $\mu$ A of current consumption, typical worst-case of 199 $\mu$ A when $\overline{WDO}$ is asserted

#### 8.2.1.2 Detailed Design Procedure - Design 1

##### 8.2.1.2.1 Meeting the Minimum Watchdog Reset Delay - Design 1

To achieve the 200 ms Watchdog Reset Delay requirement, this design simply leaves CRST pin floating (NC - No Connect) to set the Watchdog Reset Delay ( $t_{RST}$ ) to the factory-programmed delay of 200 ms. Refer to section 8.1.1 CRST Delay to learn more about the factory-programmed timing options and how to program the Watchdog Reset Delay using an external capacitor.

In [Figure 16](#) below, the Watchdog Reset Delay of 200 ms is shown by causing a watchdog timing fault. No watchdog pulse comes on WDI within the Watchdog Timeout so  $\overline{WDO}$  activates for  $t_{RST}$  of 200 ms. Then after three watchdog faults, a watchdog pulse at 1Hz and 20% duty cycle arrives on WDI causing  $\overline{WDO}$  to deactivate and remain high.

**Figure 16. Watchdog Fault Caused by Missing WDI Pulse Until WDI pulses Arrive Within Watchdog Window to Deactivate  $\overline{WDO}$  Fault**

#### 8.2.1.2.2 Setting the Watchdog Window - Design 1

The Watchdog Window is set via the CWD, SET0, and SET1 pin configurations. To achieve a Watchdog Timeout of 1 second, this design simply leaves CWD pin floating (NC - No Connect) and ties SET0 and SET1 to VDD to set these SET pins to logic high. With this configuration, the Watchdog Lower Boundary  $t_{WDL (typ)}$  is set for 800ms and the Watchdog Upper Boundary  $t_{WDU (typ)}$  is set for 1.6 seconds. Refer to Table 6.6 Timing Requirements to see the factory-programmed window watchdog timing configurations.

In [Figure 17](#) and [Figure 18](#) below, the watchdog window timing is shown by causing watchdog faults from pulses on WDI arriving too early and too late, respectively. When a pulse on WDI arrives too early, that is before  $t_{WDL (min)}$  or too late, that is after  $t_{WDU (max)}$ , a watchdog fault occurs and  $\overline{WDO}$  activates to logic low.

Figure 17. Watchdog Fault Caused by WDI Pulse Arriving Too Early (Before  $t_{WDL (min)}$ )

Figure 18. Watchdog Fault Caused by WDI Pulse Arriving Too Late (After  $t_{WDU (max)}$ )

### 8.2.1.2.3 Calculating the $\overline{WDO}$ Pull-up Resistor - Design 1

Figure 19 shows the TPS3430 uses an open-drain configuration for the  $\overline{WDO}$  circuit. When the FET is off, the resistor pulls the drain of the transistor to VDD and when the FET is turned on, the FET attempts to pull the drain to ground, thus creating an effective resistor divider. The resistors in this divider must be chosen to ensure that  $V_{OL}$  is below its maximum value. To choose the proper pull-up resistor, there are three key specifications to keep in mind: the pull-up voltage ( $V_{PU}$ ), the recommended maximum  $\overline{WDO}$  pin current ( $I_{WDO}$ ), and  $V_{OL}$ . The maximum  $V_{OL}$  is 0.4 V, meaning that the effective resistor divider created must be able to bring the voltage on the reset pin below 0.4 V with  $I_{WDO}$  kept below 10 mA. For this example, with a  $V_{PU}$  of 3.3 V, a resistor must be chosen to keep  $I_{WDO}$  below 200  $\mu\text{A}$  because this value is the maximum consumption current allowed. To ensure this specification is met, a pull-up resistor value of 16.5 k $\Omega$  is selected, which sinks a maximum of 200  $\mu\text{A}$  when  $\overline{WDO}$  is asserted.  $\overline{WDO}$  current is at 200  $\mu\text{A}$  and the low-level output voltage is approximately zero.

Figure 19. Open-Drain  $\overline{WDO}$  Configuration

### 8.2.2 Monitoring Microcontroller with a Programmed Window Watchdog Timer - Design 2

A typical application for the TPS3430 is shown in Figure 20. The TPS3430 is used to monitor the activity of the microcontroller via the WDI pin.

Figure 20. Monitoring Microcontroller Using a Window Watchdog Timer with Programmable Watchdog Reset Delay

#### 8.2.2.1 Design Requirements - Design 2

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Watchdog Reset delay	Minimum reset delay of 250 ms	Minimum reset delay of 260 ms, reset delay of 322 ms (typical)
Watchdog window	Functions with a 30-Hz pulse-width modulation (PWM) signal with a 50% duty cycle	Leaving the CWD pin unconnected with SET0 = 0 and SET1 = 0 produces a window with a $t_{WDL(max)}$ of 25.9 ms and a $t_{WDL(min)}$ of 46.8 ms
Output logic voltage	1.8-V CMOS	1.8-V CMOS
Maximum device current consumption	200 $\mu\text{A}$	10 $\mu\text{A}$ of current consumption, typical worst-case of 199 $\mu\text{A}$ when $\overline{WDO}$ is asserted

### 8.2.2.2 Detailed Design Procedure - Design 2

#### 8.2.2.2.1 Meeting the Minimum Watchdog Reset Delay - Design 2

The TPS3430 features three options for setting the watchdog reset delay: connecting a capacitor to the CRST pin, connecting a pull-up resistor, and leaving the CRST pin unconnected. If the CRST pin is either unconnected or pulled up the minimum timing requirement cannot be met, thus an external capacitor must be connected to the CRST pin. Because a minimum time is required, the worst-case scenario is a supervisor with a high CRST charging current ( $I_{CRST}$ ) and a low CRST comparator threshold ( $V_{CRST}$ ). For applications with ambient temperatures ranging from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $C_{CRST}$  can be calculated using  $I_{CRST(MAX)}$ ,  $V_{CRST(MIN)}$ , and solving for  $C_{CRST}$  in Equation 5:

$$C_{RST(MIN)} = \frac{I_{CRST(MAX)}}{V_{CRST(MIN)}} \times (t_{RST} - t_{INIT}) \quad (5)$$

When solving Equation 5, the minimum capacitance required at the CRST pin is  $0.086 \mu\text{F}$ . If standard capacitors with  $\pm 10\%$  tolerances are used, then the minimum CRST capacitor required can be found in Equation 6:

$$C_{RST(min)} = \frac{C_{RST(min)\_ideal}}{1 - C_{tolerance}} = \frac{0.086 \mu\text{F}}{1 - 0.1} \quad (6)$$

Solving Equation 6 where  $C_{tolerance}$  is 0.1 or 10%, the minimum  $C_{CRST}$  capacitor is  $0.096 \mu\text{F}$ . This value is then rounded up to the nearest standard capacitor value, so a  $0.1\text{-}\mu\text{F}$  capacitor must be used to achieve this reset delay timing. If voltage and temperature derating are being considered, then also include these values in  $C_{tolerance}$ .

#### 8.2.2.2.2 Setting the Watchdog Window - Design 2

In this application, the window watchdog timing options are based on the PWM signal that is provided to the TPS3430. A window watchdog setting must be chosen such that the falling edge of the PWM signal always falls within the window. A nominal window must be designed with  $t_{WDL(max)}$  less than  $33.33 \text{ ms}$  and  $t_{WDU(min)}$  greater than  $33.33 \text{ ms}$ . There are several options that satisfy this window option. An external capacitor can be placed on the CWD pin and calculated to have a sufficient window. Another option is to use one of the factory-programmed timing options. An additional advantage of choosing one of the factory-programmed options is the ability to reduce the number of components required, thus reducing overall BOM cost. Leaving the CWD pin unconnected (NC) with  $SET0 = 0$  and  $SET1 = 0$  produces a  $t_{WDL(max)}$  of  $25.9 \text{ ms}$  and a  $t_{WDU(min)}$  of  $46.8 \text{ ms}$ ; see [CWD Functionality](#).

#### 8.2.2.2.3 Calculating the $\overline{WDO}$ Pull-up Resistor - Design 2

The TPS3430 uses an open-drain configuration for the  $\overline{WDO}$  circuit, as shown in [Figure 19](#). When the FET is off, the resistor pulls the drain of the transistor to  $V_{DD}$  and when the FET is turned on, the FET attempts to pull the drain to ground, thus creating an effective resistor divider. The resistors in this divider must be chosen to ensure that  $V_{OL}$  is below its maximum value. To choose the proper pull-up resistor, there are three key specifications to keep in mind: the pull-up voltage ( $V_{PU}$ ), the recommended maximum  $\overline{WDO}$  pin current ( $I_{WDO}$ ), and  $V_{OL}$ . The maximum  $V_{OL}$  is  $0.4 \text{ V}$ , meaning that the effective resistor divider created must be able to bring the voltage on the reset pin below  $0.4 \text{ V}$  with  $I_{WDO}$  kept below  $10 \text{ mA}$ . For this example, with a  $V_{PU}$  of  $1.8 \text{ V}$ , a resistor must be chosen to keep  $I_{WDO}$  below  $200 \mu\text{A}$  because this value is the maximum consumption current allowed. To ensure this specification is met, a pull-up resistor value of  $10 \text{ k}\Omega$  was selected, which sinks a maximum of  $180 \mu\text{A}$  when  $\overline{WDO}$  is asserted.

### 8.2.3 Monitoring Microcontroller with a Latching Window Watchdog Timer - Design 3

A safety critical application for the TPS3430 is shown in Figure 21. The TPS3430 is used to monitor the activity of the microcontroller via the WDI pin and upon a watchdog fault, this design latches the WDO pin until the device VDD drops below  $V_{DD (min)}$ .

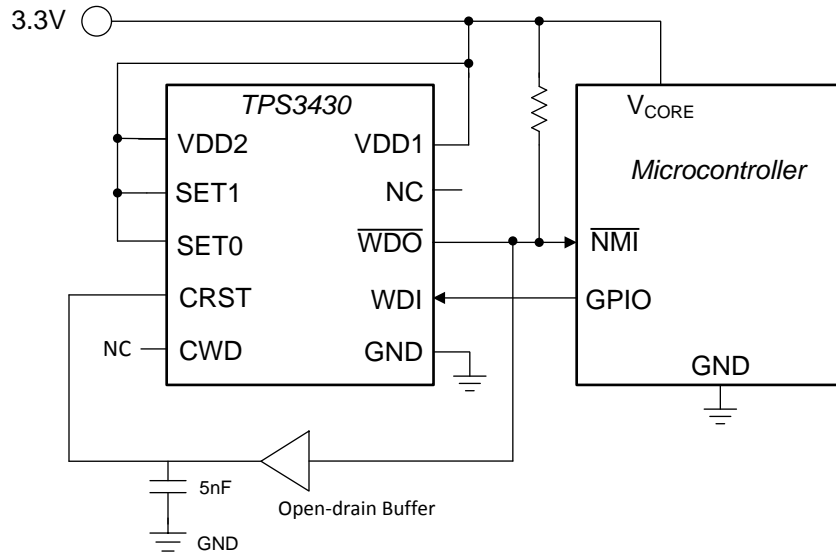

Figure 21. Monitoring Microcontroller Using a Latching Window Watchdog Timer

#### 8.2.3.1 Design Requirements - Design 3

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Watchdog Reset delay	Latch $\overline{WDO}$ upon watchdog fault	Latching watchdog functionality that keeps $\overline{WDO}$ logic low when fault occurs
Watchdog window	Functions with a 1-Hz pulse-width modulation (PWM) signal with a 50% duty cycle	Leaving the CWD pin unconnected with SET0 = 1 and SET1 = 1 produces a window with a $t_{WDL(max)}$ of 920 ms and a $t_{WDU(min)}$ of 1360 ms
Output logic voltage	3.3-V Open-Drain	3.3-V Open-Drain
Maximum device current consumption	200 $\mu$ A	10 $\mu$ A of current consumption, typical worst-case of 199 $\mu$ A when $\overline{WDO}$ is asserted

#### 8.2.3.2 Detailed Design Procedure - Design 3

##### 8.2.3.2.1 Meeting the Latching Output Requirement - Design 3

To achieve the latching watchdog feature, an open-drain buffer is connected from  $\overline{WDO}$  to CRST with a small value capacitor connected from the Anode of the buffer connected to CRST to GND. The capacitor should be small value to prevent additional delay when triggering  $\overline{WDO}$  to active low during watchdog fault. A capacitor between 150pF and 5nF is recommended.

In Figure 22 below, the latching watchdog feature is shown by causing a watchdog fault and observing  $\overline{WDO}$ . Since no pulse arrive on WDI within the Watchdog Timeout,  $\overline{WDO}$  activates and goes logic low and remains low. To reset the watchdog, the device must be restarted by dropping VDD below  $V_{DD (min)}$ .

### 8.2.3.2 Setting the Watchdog Window - Design 3

The Watchdog Window is set via the CWD, SET0, and SET1 pin configurations. To achieve a Watchdog Timeout of 1 second corresponding to a 1-Hz WDI signal, this design simply leaves CWD pin floating (NC - No Connect) and ties SET0 and SET1 to VDD to set the SET pins to logic high. With this configuration, the Watchdog Lower Boundary  $t_{WDL (typ)}$  is set for 800 ms and the Watchdog Upper Boundary  $t_{WDU (typ)}$  is set for 1.6 seconds. Refer to Table 6.6 Timing Requirements to see the factory-programmed window watchdog timing configurations.

### 8.2.3.3 Application Curve - Design 3

Figure 22. Watchdog Fault Caused by Missing WDI Pulse Shows  $\overline{WDO}$  Latching

## 9 Power Supply Recommendations

This device is designed to operate from an input supply with a voltage range between 1.6 V and 6.5 V. An input supply capacitor is not required for this device; however, if the input supply is noisy, then good analog practice is to place a 0.1- $\mu$ F capacitor between the VDD pin and the GND pin. Please be sure to externally connect VDD1 to VDD2 as the device will not function if these pins are not connected.

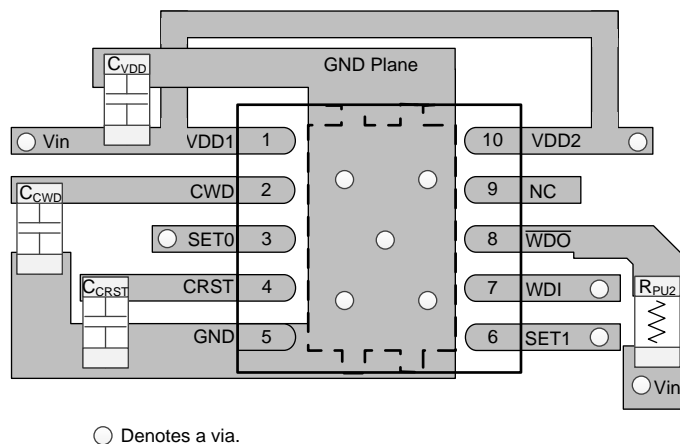

## 10 Layout

### 10.1 Layout Guidelines

Make sure that the connection to the VDD pin is low impedance. Good analog design practice recommends placing a 0.1- $\mu$ F ceramic capacitor as near as possible to the VDD pin. If a capacitor is not connected to the CRST pin, then minimize parasitic capacitance on this pin so the  $\overline{\text{WDO}}$  delay time is not adversely affected.

- Make sure that the connection to the VDD pin is low impedance. Good analog design practice is to place a 0.1- $\mu$ F ceramic capacitor as near as possible to the VDD pin.
- If a  $C_{\text{CRST}}$  capacitor or pull-up resistor is used, place these components as close as possible to the CRST pin. If the CRST pin is left unconnected, make sure to minimize the amount of parasitic capacitance on the pin.
- If a  $C_{\text{CWD}}$  capacitor or pull-up resistor is used, place these components as close as possible to the CWD pin. If the CWD pin is left unconnected, make sure to minimize the amount of parasitic capacitance on the pin.
- Place the pull-up resistor on  $\overline{\text{WDO}}$  as close to the pin as possible.

### 11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS3430WDRRCR	ACTIVE	VSON	DRC	10	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	430AA	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TPS3430 :**

- Automotive: [TPS3430-Q1](#)

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS3430WDRCR	VSON	DRC	10	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS3430WDRCR	VSON	DRC	10	3000	367.0	367.0	35.0

## GENERIC PACKAGE VIEW

**DRC 10**

**VSON - 1 mm max height**

3 x 3, 0.5 mm pitch

PLASTIC SMALL OUTLINE - NO LEAD

This image is a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

# EXAMPLE BOARD LAYOUT

DRC0010J

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:20X

SOLDER MASK DETAILS

4218878/B 07/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

DRC0010J

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 11:  
80% PRINTED SOLDER COVERAGE BY AREA  
SCALE:25X

4218878/B 07/2018

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale ([www.ti.com/legal/termsofsale.html](http://www.ti.com/legal/termsofsale.html)) or other applicable terms available either on [ti.com](http://ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.
