Developing technology, the rapid growth of the world population, changing demands made energy efficiency and the need for energy a priority in the industry of our country and the world. For this reason, as PROVAR, we have started out with the aim of guiding the efficiency, quality, analysis and proper use of energy by examining the demands in the sector in detail . We aim to transfer our knowledge and experience of 15 years to the world starting from our country by creating innovative solutions in line with the determined needs.

A new brand is born in the field of Energy Power Quality and Industrial Electronics. We invite you to use the products of PROVAR Electronics and become a solution partner.

**PROVAR;**

- has the potential of 100% local capital and manufacturing, design and software.
- manufactures innovative, functional and high-quality products with its strong R&D and manufacturing teams.
- adopts compliance with Production and Quality Standards accepted in our country and the world as a principle.

Our mission is to transform our knowledge and experience into a company that lives and sustains reliability, loyalty, continuity and respectability, which we believe are essential.

Our vision is, with our business partners and valuable employees, to achieve unconditional customer satisfaction, and to be an exemplary manufacturing company in our country and the world by manufacturing within the principle of continuous innovation and the framework of international quality standards.

**OUR FIELDS OF OPERATION**

- Measurement and Control of Energy
- Quality and Efficiency of Energy
- Compensation Solutions
- Remote Control and Automation Solutions
- Communication Units

# PRC Series

## Reactive Power Control Relays

- ▶ PRC-15
- ▶ PRC-15H+TCR
- ▶ PRC-18H+TCR
- ▶ PRC-18TH+TCR

PRC Series Reactive Power Control Relays are innovative devices designed as classical, SVC supported, thyristor triggered with the hard work of our expert R&D team in power quality and compensation applications. It is designed and manufactured to minimize the reactive power generated in the facilities in accordance with the compensation regulation for 3-phase electrical systems, to obtain maximum efficiency with the minimum number of steps in the compensation of unbalanced loads that occur with SVC support, to measure the electrical parameter values in the facilities, and to protect the system with alarm options.

It offers design and efficiency together with its 100-265V AC/DC wide supply range, ergonomic design in 144x144x68 mm dimensions, SVC support and product variety with advanced features.

- **128x64 Graphic LCD Display**
- **Easy to Use with Turkish and English Menu Options**
- **RS-485 Communication (Modbus RTU)**
- **TCR (SVC) Output**
- **RTC**
- **Event and Log Records**
- **Discrete Harmonics (2-31. HD-I ve HD-V)**
- **V, A, P, Q, S, PF, Cos $\phi$ ,  $\Sigma$ P,  $\Sigma$ Q,  $\Sigma$ S, THD-I, THD-V (Monitoring Parameters)**
- **Import and Export Energies**
- **Can Compensate Inductive and Capacitive Systems**
- **Generator Input, Generator Energy Record and Compensation (Cos2)**
- **A Single Phase, Two Phase or Three Phase Capacitor / Shunt Reactor Support**
- **Step Value Can Be Entered Manually**
- **Monthly, Weekly, Daily, Hourly and Total Compensation Rates Can Be Monitored**
- **1 Adjustable Alarm Output for Electrical and Compensation Parameters**
- **Built-in Buzzer**
- **Step On, Off, Discharge and Transition Times Can Be Adjusted**
- **Step Advice and Step Co-Aging**
- **Cosine and Energy Values of Each Phase Can Be Monitored**

- ▶ PTCR-30H

Inductive Load Drivers are also called TCR (Thyristor Controlled Reactor). It is designed to drive single-phase reactors with maximum VAR power, which the driver can drive per phase in three-phase systems, by creating a phase difference with voltage values.

Thanks to its trigger structure even at low power levels, it provides maximum power quality with less steps in compensation. 20 ms for compensation of fast loads. It is extremely effective thanks to its trigger structure. It requires minimal maintenance with its powerful electronic design.

### Usage Areas

- School
- Hospital
- Shopping Centre
- Office
- Hotel
- Bank Branches
- Public Buildings

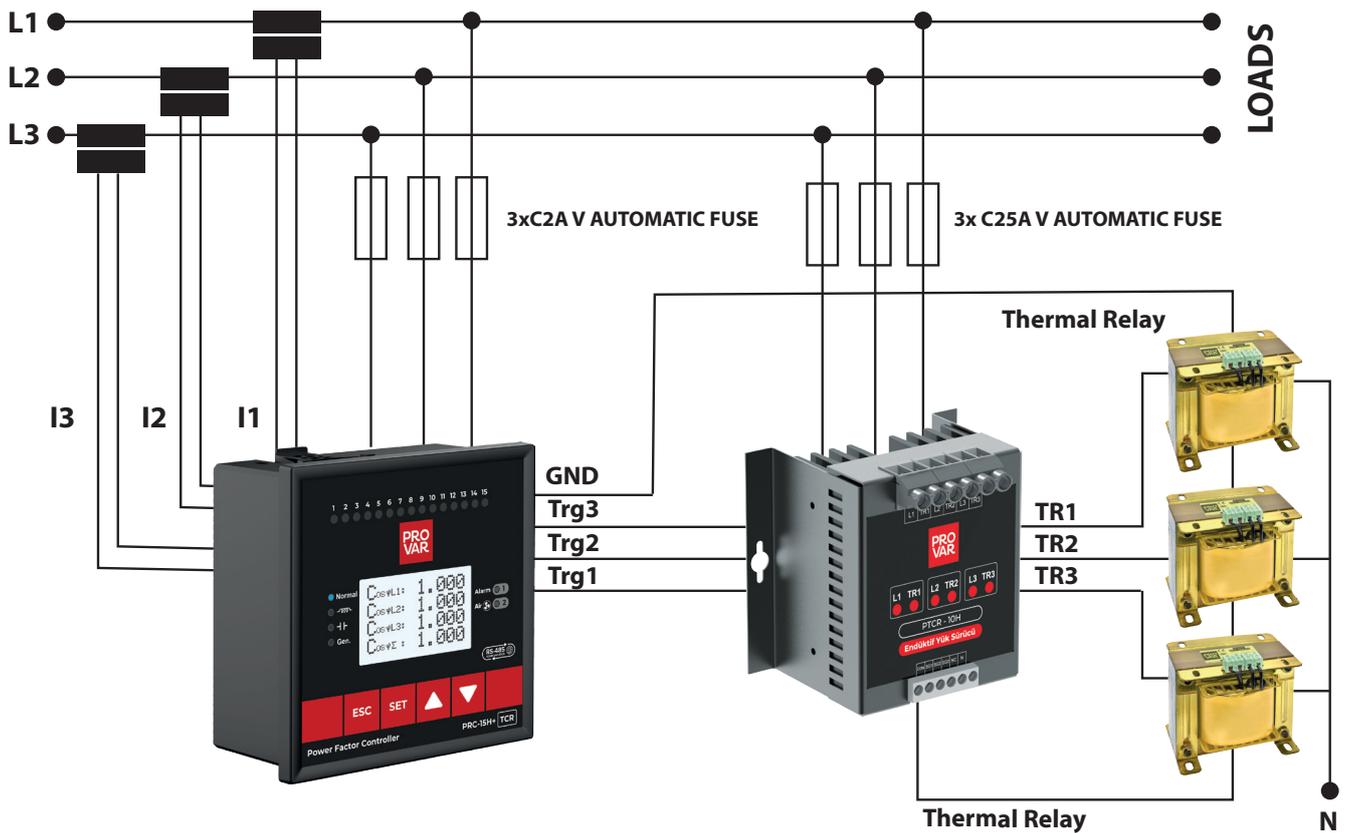

Product Code	Product Description	Dimensions (mm) (Wid.-Dep.-Height)	Maximum Connectable Shunt Reactor Power (kVAr)	Voltage	Cable Cross Section	Fuse Current to be Used
PTCR-5H	5 kVAr Inductive Load Driver	110x106x77	3 x 1,66 kVAr(230V)	230V	2,5 mm <sup>2</sup>	16 A
PTCR-10H	10 kVAr Inductive Load Driver	120x106x88	3 x 3,33 kVAr(230V)	230V	4 mm <sup>2</sup>	25 A
PTCR-20H	20 kVAr Inductive Load Driver	164x167x153	3 x 6,67 kVAr(230V)	230V	10 mm <sup>2</sup>	63 A
PTCR-30H	30 kVAr Inductive Load Driver	164x167x153	3 x 10 kVAr(230V)	230V	16 mm <sup>2</sup>	100 A

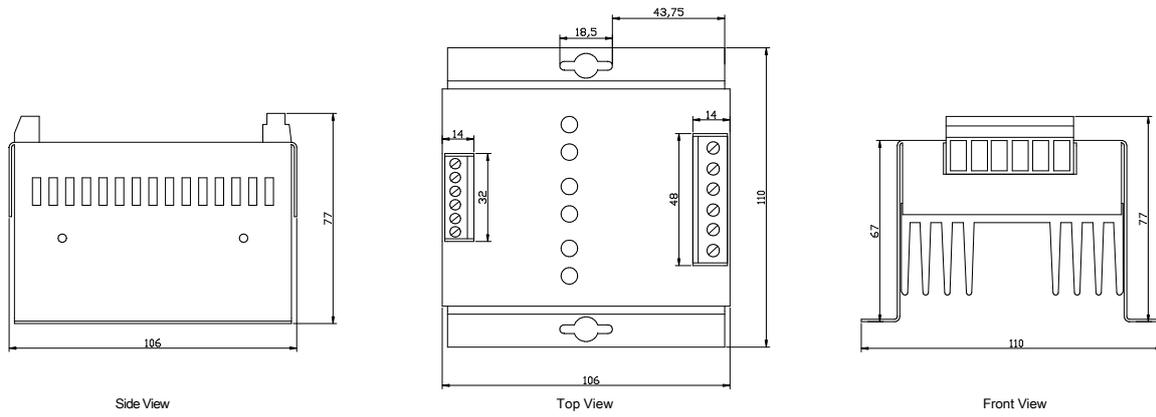

### Technical Specifications Table

Operating Voltage	400 VAC
Operating Frequency	50 Hz
Power	5 kVAr-10 kVAr-20 kVAr-30 kVAr
Reaction Time	20 ms
Trigger Voltage	12V DC
Operating Altitude	<2000 m
Protection Class	IP20
Protection ( Electrical )	Fan protection against overheating (PTCR-20H & PTCR-30H)
Humidity	Maximum %90
Operating Voltage	-25°C .....+70°C

Provar PTSC series thyristor switches are designed for use in businesses with fast and variable loads. Elevator, crane, spot welding etc. fast load change occurs in businesses with loads. Normal compensation panels are insufficient in such enterprises. For this reason, thyristor switches are preferred for safe opening and closing.

Thyristor switches must be used with harmonic filters, and fast type fuses must be selected when choosing a fuse. In addition, the capacitors to be used in thyristor switches should be chosen as a minimum of 525 Volts. PTSC series modules can make 20 ms fast switching.

Our PAD Series Energy Analyzers are designed to measure all parameters of the electrical network, to calculate the consumed energies, to protect and control the system with alarm options, and to display all measured parameters, with the intensive work of our expert R&D team in the field of Power Quality.

It offers design and efficiency together with its 45-265V AC/DC wide supply range, ergonomic design of 96x96x51 mm dimensions and RS-485 communication (Modbus RTU) feature, which is standard in all our energy analyzer series.

# PMA Series Digital Multimeters

- ▶ PMA-01
- ▶ PMA-120D
- ▶ PMA-02
- ▶ PMA-03

Our PMA Series Multimeters are able to calculate Current, Voltage, Frequency, Apparent Power, Minimum and Maximum Voltage, Current Demand, Maximum Current Demand values of 3-phase electrical systems, with the hard work of our expert R&D team in the field of Power Quality and Energy solutions. It is designed and manufactured to measure and protect the system with alarm options.

It offers design and efficiency together with its 45-265V AC/DC wide supply range, ergonomic design in 96x96x51 mm dimensions and product range with advanced features.

- 4 x 4 Digit 14 mm Digital LED Display
- Easy-to-Use Menu
- Voltage, Current and Frequency Protection
- Phase-Phase or Phase-Neutral Protection
- Phase Sequence Error Information and Protection
- Three-phase L-N and L-L Voltage Information
- Three-phase Current and Frequency Information
- Adjustable Relay Outputs
- V, A, S, ve  $\sum S$  (Monitoring Parameters)
- RS-485 Communication (Modbus RTU)
- Min, Max and Demands
- Connection Type ( $\Delta$ ,  $\Delta$ )

- ▶ PMD-04

Our PMD Series Multimeters are able to calculate Current, Voltage, Frequency,  $\text{Cos}\phi$ , Active Power, Apparent Power, Reactive Power, Minimum and Maximum Voltage, Current Demand, Maximum Current Demand values of 3-phase electrical systems, with the hard work of our expert R&D team in the field of Power Quality and Energy solutions. It is designed and manufactured to measure and protect the system with alarm options.

It offers design and efficiency together with its 45-265V AC/DC wide supply range, ergonomic design in 96x96x51 mm dimensions and product range with advanced features.

- **128x64 Wide Graphic LCD Display**
- **Easy to Use with Turkish and English Menu Options**

# PROVAR® PICS-G Series Gateways

- ▶ **PMGW Series**
- ▶ **PGGW Series**
- ▶ **PEGW Series**

Provar Industrial Communication Systems subgroup Gateway products; inverters, PLC, energy analyzers, electricity meters, etc. they are gateway devices designed to quickly and reliably connect devices with RS485 serial ports over a wired or cellular network.

- **45-265 VAC/DC Wide Supply Range**
- **45-65 Hz Operating Frequency Range**
- **4 kV Isolation Voltage**
- **GSM 4 Band Operability (850/900/1800/1900 Mhz)**
- **Ability to Work in TCP Server/Client Mode**
- **Ability to Operate as TCP/RS485 Transparent**
- **Remote Connection with Modbus TCP or Modbus RTU/ASCII Over TCP**
- **Working Between 300-921600 bps**
- **Modbus RTU/ASCII Protocol Support**
- **2 x 3.75 kV Protected Digital Inputs**
- **2 x 5A 250VAC/28VDC Relay Output**
- **IEC62056-21 Protocol Support for Meters Communicating over RS485**

# PCC Series Capacitor Contactors

## ► PCC Series

Provar Compensation Contactors have a double-stage structure specially designed to prevent high inrush currents, are equipped with contact set and current limiting resistors and are protected against direct contact. These contactors, which cannot be operated manually, provide facility safety as well as life safety. When the contactor coil is energized, first the transition block contacts are closed and shortly after the first inrush current passes over these contacts, the contacts open, and the rated current of the capacitors starts to pass through the main contacts. Capacitors can cause high frequency between 1 and 15 kHz at the time of first commissioning and very short-term high currents, which can be up to 150 times the rated current. Since the process of adding pre-resistance to all three phases to which the capacitor is connected is difficult and time-consuming under normal conditions, only compensation contactors designed for this purpose are used.

### Usage Areas

- School
- Hospital
- Shopping Centre
- Office
- Hotel
- Bank Branches
- Public Buildings

### Main Features

- Auxiliary Contact Block
- Three-phase Connection
- Possibility to connect capacitors up to 75 kVAr
- Coil Voltage: 230 VAC %10, 50/60 Hz
- IEC-60947 Compatible
- Long Electrical Life
- Operating Voltage Range: 400/440-660/690

### General Specifications Table

# PSC & PTC Series Capacitors

- ▶ PSC Monophase
- ▶ PTC Three-phase

Provar PSC (Monophase) and PTC (Three-phase) series capacitors are designed in accordance with harsh conditions and adverse conditions that will shorten the life they will be exposed to in compensation. Provar PSC and PTC series capacitors have protection methods that prevent the capacitor from exploding at the end of its life or in electrical thermal overloads, with a circuit disconnector system under extreme pressure.

Provar PSC and PTC series capacitors are manufactured using metallized polypropylene film with self-healing feature. It has superior durability with its ability to work in harsh conditions and a lifespan of 65°C 130,000 / 55°C 180,000 hours.

## Usage Areas

- School
- Hospital
- Shopping Centre
- Office
- Hotel
- Bank Branches
- Public Buildings

## Main Features

- Compact Cylindrical Body
- Easy Setup
- PCB Free
- Eco-Friendly
- High Temperature Resistance
- Shockproof Terminal
- Long Life
- IEC 60831 1&2 . IS:13340 Compliance with Standards

## Design and Construction

- Mkp Film, Cylindrical Structure, Aluminum Case
- High Power Density Resistant Body
- Low Loss, Zinc Fragments
- Self-healing Film Design
- Long Lasting and Reliable

## Explosion Protection

Capacitors tend to explode when exposed to overvoltage for a long time. Provar PSC and PTC series capacitors can prevent explosions with their ability to expand under increasing pressure and internal pressure settings.

Shunt reactors are devices that create an inductive effect. For this reason, they are also called 'Inductive Load Reactor' and are used for balancing (compensation) in systems with high capacitive-reactive energy.

#### Main reasons for capacitive-reactive effect in energy systems:

- In systems fed with very long energy cables such as TV-radio transmitters and radio base stations installed outside the city centers, the capacitive effect of the supply cables due to the low load capacity causes the system to overcompensate.
- A similar capacitive effect occurs in energy transmission lines and general energy distribution systems.
- Capacitive-reactive energy increases in the system as a result of excessive use of capacitor-containing electronic devices such as UPS and similar or excessive compensation in the facility.

#### Main problems caused by capacitive-reactive energy in energy systems

- Reactive energy causes fines to be paid,
- It reduces the efficiency and life of the energy system, equipment and machinery connected to the system,
- Causes less active energy power flow to the system
- It causes unwanted maintenance and repair costs in the energy system.

In order to eliminate these problems, it is necessary to connect a shunt reactor parallel to the system. Shunt reactors dampen the undesired capacitive effect by creating an inductive load, thus eliminating the above-mentioned problems.

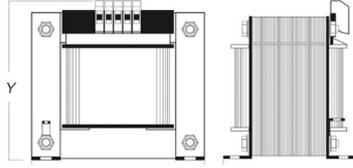

Shunt reactors are also used as an inductive load in electrical test systems and laboratories, in addition to compensation systems. We produce shunt reactors, which we produce at standard values, in different voltage and power values for the needs of the facility to be compensated. In order to establish a high quality compensation system for industrial facilities with high harmonic distortions, a harmonic analysis report and reactive load values of each phase must be reported.

#### ROUTINE TESTS (All or some of the following test types)

Routine product tests of our shunt reactors are carried out during the production phase as specified in the EN 61558 2-20 standard. Type product tests are carried out and delivered depending on customer demand.

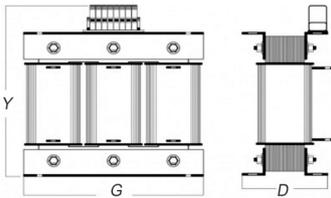

- Inductance Test
- Current Test
- Resistance Test
- Impact Resistance Test
- Insulation Strength Test
- Short Circuit Withstand Test
- Temperature Rise Test

### Monophase Shunt Reactors (Un: 230V AC, Fn: 50 Hz)

<b>Windings</b>	Electrolytic copper or aluminum coil wire - foil
<b>Design</b>	Air gap design
<b>Connection</b>	Transformer terminal, Rail terminal, SKP lug, Copper busbar
<b>Protection ( Electrical )</b>	Thermal protection against overheating
<b>Protection Class</b>	IP00 ( Installation in a cabinet suitable for the desired protection class upon request )
<b>Insulation Class</b>	Class 1, optionally F 155 °C or H 180 °C
<b>Preservation</b>	Varnish under vacuum, class f or h, upon request
<b>Relative Humidity</b>	%90 Non-condensing ( DIN 40040 )
<b>Operating Altitude</b>	0 - 2000 m
<b>Operating Environment Temperature</b>	-10 °C .... +40 °C
<b>Storage Temperature</b>	-10 °C .... +70 °C
<b>Production Suitable for Needs</b>	Design according to the voltage and power rating of your energy system

Harmonic distortions caused by non-linear loads in energy systems cause serious problems in industrial facilities. The causes of harmonic distortions and the problems that are frequently encountered due to these distortions are summarized below;

#### CAUSES OF HARMONIC DISORDERS

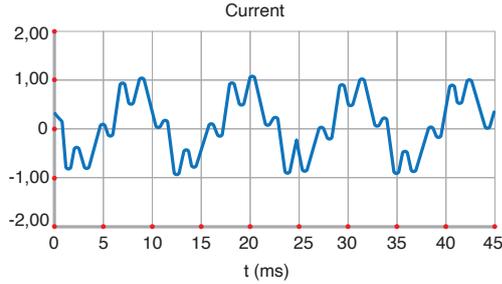

The source of harmonic distortions occurring in THD, that is, voltage and current, are non-linear loads;

- Uninterruptible power supplies
- Motor starters
- Motor drivers
- Speed controllers
- Computer and electronic lighting
- Welding machines
- Power electronics converters
- Rectifiers

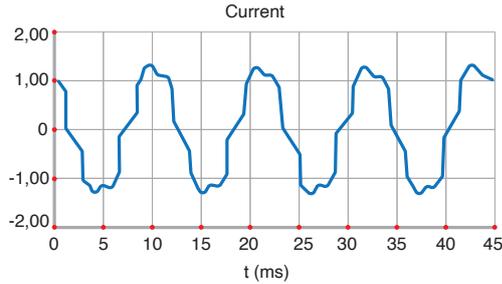

#### MAIN FAULTS CAUSED BY HARMONIC DISORDERS;

- Heating in electromechanical devices and cables
- Mechanical vibrations (vibration) in machines
- Abnormal operation of ignition circuits
- Voltage spikes
- Punctures in cables and other electromechanical devices due to high voltage
- Malfunctions in electronic cards, devices and computers
- Power losses, ruptures and explosions in power capacitors
- Trips in compensation fuses
- Unexplained trips in breakers and switches
- Distortion and abnormal operation of relay signals
- Energy losses

**Current harmonics in compensation system without harmonic filter**

**Harmonic changes in compensation system with harmonic filter**

The minimum information you need to convey to our company so that we can respond to your harmonic filter requests;

- Mains voltage
- Resonant frequency (134, 189, 210 Hz)
- Capacitor powers and voltage values.

**ROUTINE TESTS**

All routine tests specified in the standards are performed and offered to customers. Type tests are carried out upon customer request.

- Inductance Test
- Current Test
- Resistance Test
- Impact Resistance Test
- Insulation Strength Test
- Short Circuit Withstand Test
- Temperature Rise Test

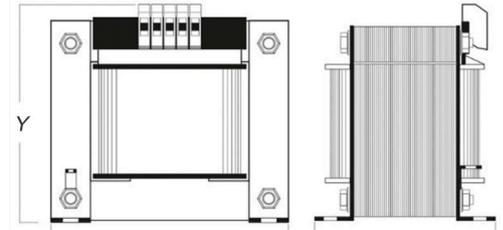

Particular attention should be paid to the selection of filters and capacitors in the filter compensation systems to be installed in order to correct harmonic distortions. The design of harmonic filters is made according to factors such as resonance frequency (mostly 134, 189, 210 Hz), capacitor power and capacitor voltage.

A higher voltage is output from the harmonic filters compared to the mains voltage. Considering that the voltage value is higher than normal especially in organized industrial zones during the night, pay attention to the high voltage values of the capacitors to be installed in the system.

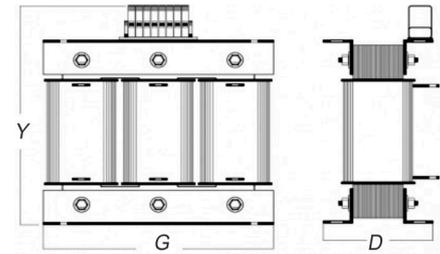

Do not forget that the resonance frequency of the system will shift and the performance will decrease when capacitors with different values of voltage and power are connected to the harmonic filters. For this reason, take care to use filters designed according to the power and voltage values of the capacitors.

Harmonic filters cause an increase in temperature inside the panel. For this reason, make sure that the panels are made in such a way as to provide sufficient air flow. In harmonic filter compensation systems, the final power will be different from the sum of the capacitor power values. For this reason, do not forget to take into account harmonic filters while calculating power in order not to make incomplete compensation.

<b>Production Standards</b>	EN 61558-1, EN 61558 2-20, EN 60289 and EN60076-6 CE Certificated
<b>Design</b>	Air gap design
<b>Rated Powers</b>	Single-phase 0.10 - 10 kVAr or three-phase 0.5 - 100 kVAr generation
<b>Rated Voltage</b>	230 VAC ..... 1000 VAC
<b>Rated Frequency</b>	50 Hz ( 60 Hz Optional)
<b>Resonant Frequency</b>	134 Hz p= %14 189 Hz p= % 7 210 Hz p=%5,67
<b>Inductive Tolerance</b>	± % 3
<b>Linearity</b>	1,6 In .... 2,2 In
<b>Magnetic Circuit</b>	High magnetic permeability 0.35 mm silica lamination
<b>Windings</b>	Electrolytic copper or aluminum coil wire - foil
<b>Connection</b>	Transformer terminal, Rail terminal, SKP lug, Copper busbar
<b>Protection ( Electrical )</b>	90 °C 1 NK contact thermistor
<b>Protection Class</b>	IP00
<b>Insulation Test Voltage</b>	3000 VAC ( Between the windings and the sheet core )
<b>Insulation Class</b>	Class 1, optionally F 155 °C or H 180 °C
<b>Thermal Class</b>	Ta 55 °C / F or Ta 60 °C / H
<b>Preservation</b>	Varnish under vacuum, class f or h, upon request
<b>Cooling</b>	Natural
<b>Relative Humidity</b>	%95 Non-condensing ( DIN 40040 )
<b>Operating Altitude</b>	0 - 2000 m
<b>Operating Environment Temperature</b>	-10 °C .... +40 °C
<b>Storage Temperature</b>	-10 °C .... +70 °C
<b>Production Suitable for Needs</b>	Design according to the voltage and power rating of your energy system

**Monophase Harmonic Filter P:%7 189 Hz**

Product Code	Product Description	Power (kVAr)	Voltage	A (In)	Ln (mH)	Thermal Protection	Resonant Frequency	P Factor	Dimensions (mm)	Connection	Weight (kg)
