

# SHIELD-LCD16×2 custom firmware note

29-07-14 OLIMEX LTD

SHIELD-LCD16×2 is a two-row display compatible with the shield layout of Arduino and Arduino-like boards.

It is equipped with a PIC16 microcontroller that holds custom firmware. The firmware makes sending and receiving commands to the display easier – it implements I2C and UART communication to the display and the rest of the board's features (buttons, LEDs, etc). There are also several commands implemented and they are discussed in this document.

The sources of the firmware are also published on the product's page. You can freely use the sources as a template or a foundation to building an even more sophisticated firmware.

A good way to further comprehending the firmware and the command usage would be inspecting the examples available. These are also available at the product's web page.

## 1. I2C commands

---

All available i2c commands are using standard protocol format. You should use only 100kHz bus. For higher clock speed it's not guaranteed proper operation of the shield.

### 1.1 SET\_TRIS (0×01)

---

This command sets port direction of all available pins. These are GPIO1 to GPIO9. To make GPIO output you should write 0 as value. For input – 1.

|   |      |   |     |      |     |       |     |       |     |   |
|---|------|---|-----|------|-----|-------|-----|-------|-----|---|
| S | ADDR | W | ACK | 0×01 | ACK | GPIO# | ACK | VALUE | ACK | P |
|---|------|---|-----|------|-----|-------|-----|-------|-----|---|

ADDR:

I2C slave address → 0×30 (default)

W:

Write/read flag:

**0** → write

1 → read

GPIO#:

1 → GPIO1

2 → GPIO2

3 → GPIO3

4 → GPIO4

5 → GPIO5

6 → GPIO6

7 → GPIO7

8 → GPIO8

9 → GPIO9

VALUE:

1 → INPUT

0 → OUTPUT

## 1.2 SET\_LAT (0×02)

---

If a pin is configured as output you can set its level using this command. Valid values as 0 for low level and 1 – for high. They correspond to 0V and 3.3V.

|   |      |   |     |      |     |       |     |       |     |   |
|---|------|---|-----|------|-----|-------|-----|-------|-----|---|
| S | ADDR | W | ACK | 0×02 | ACK | GPIO# | ACK | VALUE | ACK | P |
|---|------|---|-----|------|-----|-------|-----|-------|-----|---|

ADDR:

I2C slave address → 0×30 (default)

W:

Write/read flag:

**0** → **write**

1 → read

GPIO#:

1 → GPIO1

2 → GPIO2

3 → GPIO3

4 → GPIO4

5 → GPIO5

6 → GPIO6

7 → GPIO7

8 → GPIO8

9 → GPIO9

VALUE:

1 → HIGH (3.3V)

0 → LOW (0V)

## 1.3 GET\_PORT (0×03)

---

If GPIO is configured as input you can periodically read its state with this command. Like in the previous command 1 corresponds to high level (3.3V) and 0 – low (0V).

|   |      |   |     |      |     |       |     |   |   |      |   |     |     |      |   |
|---|------|---|-----|------|-----|-------|-----|---|---|------|---|-----|-----|------|---|
| S | ADDR | W | ACK | 0×03 | ACK | GPIO# | ACK | P | S | ADDR | R | ACK | VAL | NACK | P |
|---|------|---|-----|------|-----|-------|-----|---|---|------|---|-----|-----|------|---|

ADDR:

I2C slave address → 0×30 (default)

W:

Write/read flag:

**0** → **write**

1 → read

R:

Write/read flag:

0 → write

**1** → **read**

GPIO#:

1 → GPIO1

2 → GPIO2

3 → GPIO3

4 → GPIO4

5 → GPIO5

6 → GPIO6

7 → GPIO7

8 → GPIO8

9 → GPIO9

VALUE:

1 → HIGH (3.3V)

0 → LOW (0V)

## 1.4 GET\_BUT (0x05)

---

The state of the four buttons can be read all the same time using one command. The four LSB of the returned value represent the state of the buttons. For example is command return 0x05 then:

0x05 → 0b00000101

This mean:

button1 → 1 → OFF  
button2 → 0 → ON  
button3 → 1 → OFF  
button4 → 0 → ON

Notice that buttons default state is 1, so when the value is 0 the button is pressed.

|   |      |   |     |      |     |   |   |      |   |     |     |      |   |
|---|------|---|-----|------|-----|---|---|------|---|-----|-----|------|---|
| S | ADDR | W | ACK | 0x05 | ACK | P | S | ADDR | R | ACK | VAL | NACK | P |
|---|------|---|-----|------|-----|---|---|------|---|-----|-----|------|---|

ADDR:

I2C slave address → 0x30 (default)

W:

Write/read flag:

**0** → **write**

1 → read

R:

Write/read flag:

0 → write

**1** → **read**

## 1.5 GET\_ID (0x20)

---

You can verify that device is present using GET\_ID command. The returned value should be compared to the default one (0x65).

|   |      |   |     |      |     |   |   |      |   |     |     |      |   |
|---|------|---|-----|------|-----|---|---|------|---|-----|-----|------|---|
| S | ADDR | W | ACK | 0x20 | ACK | P | S | ADDR | R | ACK | VAL | NACK | P |
|---|------|---|-----|------|-----|---|---|------|---|-----|-----|------|---|

ADDR:

I2C slave address → 0x30 (default)

W:

Write/read flag:

**0** → **write**

1 → read

R:

Write/read flag:

0 → write

**1** → **read**

## 1.6 GET\_FRM (0x21)

---

Same as above to check firmware version.

|   |      |   |     |      |     |   |   |      |   |     |     |      |   |
|---|------|---|-----|------|-----|---|---|------|---|-----|-----|------|---|
| S | ADDR | W | ACK | 0x21 | ACK | P | S | ADDR | R | ACK | VAL | NACK | P |
|---|------|---|-----|------|-----|---|---|------|---|-----|-----|------|---|

ADDR:

I2C slave address → 0x30 (default)

W:

Write/read flag:

**0** → **write**

1 → read

R:  
Write/read flag:  
0 → write  
1 → **read**

### 1.7 LCD\_CLR (0×60)

---

Clears everything that is displayed on the lcd.

|   |      |   |     |      |     |   |
|---|------|---|-----|------|-----|---|
| S | ADDR | W | ACK | 0×60 | ACK | P |
|---|------|---|-----|------|-----|---|

ADDR:  
I2C slave address → 0×30 (default)

W:  
Write/read flag:  
0 → **write**  
1 → read

### 1.8 LCD\_WR (0×61)

---

Writes one character at time at position X, Y. X must be between 1 and 16. Y must be between 1 and 2.

|   |      |   |     |      |     |   |     |   |     |      |     |   |
|---|------|---|-----|------|-----|---|-----|---|-----|------|-----|---|
| S | ADDR | W | ACK | 0×61 | ACK | X | ACK | Y | ACK | CHAR | ACK | P |
|---|------|---|-----|------|-----|---|-----|---|-----|------|-----|---|

ADDR:  
I2C slave address → 0×30 (default)

W:  
Write/read flag:  
0 → **write**  
1 → read

X:  
X coordinate → 1 – 16

Y:  
Y coordinate → 1 – 2

CHAR:  
Hex code of displayed character

### 1.9 SET\_BL (0×62)

---

This is used to turn on and off the backlight of LCD. It can vary from 0 to 255.

|   |      |   |     |      |     |       |     |   |
|---|------|---|-----|------|-----|-------|-----|---|
| S | ADDR | W | ACK | 0×62 | ACK | VALUE | ACK | P |
|---|------|---|-----|------|-----|-------|-----|---|

ADDR:  
I2C slave address → 0×30 (default)

W:  
Write/read flag:  
0 → **write**  
1 → read

VALUE:  
Blacklisting level → from 0 to 255

## 1.10 UART\_EN (0×10)

---

Enables UART communication to the module.

|   |      |   |     |      |     |       |     |   |
|---|------|---|-----|------|-----|-------|-----|---|
| S | ADDR | W | ACK | 0×10 | ACK | VALUE | ACK | P |
|---|------|---|-----|------|-----|-------|-----|---|

ADDR:

I2C slave address → 0×30 (default)

W:

Write/read flag:

**0** → **write**

1 → read

VALUE:

0 → UART disable

1 → UART enable

## 2. UART commands

---

UART needs to be enabled with UART\_EN command first!

When using UART, baud-rate should be set at 9600. All commands should end with '/r' and '/n'.

1. TRIS:g:v

Same as SET\_TRIS:

g → GPIO number – 1 to 9

v → value

2. LAT:g:v

Same as SET\_LAT:

g → GPIO number – 1 to 9

v → value

3. PORT:g

Same as GET\_PORT:

g → GPIO number – 1 to 9

4. BUT

Same as GET\_BUT.

5. GOTOXY:x:y

Set cursor to given X and Y coordinate.

6. BLKL:v

Same as SET\_BL

v → value – 0 to 255

7. WR:v

Write characters to lcd.

8. CLEAR

Clear screen.
