

**EVAL-ADF7xxxMB4z****Features**

**Suitable for all new generation ADF7xxxDBxz  
Daughter Boards available from ADI**  
**Programmable 64pin Renesas RL78**  
**Ethernet Capability**  
**SD card slot**  
**128 x 64 Dot Matrix Screen**  
**Touch Screen Capability**  
**USB communications**  
**DUAL UART Communications**  
**Onboard Debugger**  
**Expansion Header to all uC GPIOs**  
**8 x General Purpose LEDs**  
**Multiple powering options**

**General Description**

The EVAL-ADF7xxxMB4z Evaluation Board is the Motherboard for all new generation ADF7xxxDBxz Daughter boards. The Daughter Board plugs directly into the motherboard to provide a full ADF7xxx development kit for a wide range of applications depending on the daughterboard selection.

# Revision History

Date: June 17<sup>th</sup> 2014

Revision: Rev.1.0

## Hardware Overview

The Development Platform consists of the Eval-ADFxxxMB4Z mother board to which an appropriate daughter card may be connected. The available daughter cards are given in . Schematics for the motherboard are given in the Schematics section of this document.

## Power Supply

There are two options to power the ADFxxxMB4Z mother board.

1. USB powered
2. Battery powered

The mother board may be powered via the USB cable supplied. The 5V from the USB cable is regulated down to 3.3 V for the various chips on the board such as the R5F100LLA microcontroller and the ADF7023 transceiver. Alternatively a battery may be used to power the microcontroller and transceiver. A 3.6V battery is shipped with the boards.

# Getting Started

## Installing Software

The “*ADF7xxxMB4z Evaluation Suite*” software and documentation can be installed from the CD supplied with the board, or the Analog Devices Website.

Before connecting the ADF7xxxMB4z to the PC via the USB connector, it is mandatory to install the USB drivers needed for proper communication between the ADF7xxxMB4z and applicable PC tools.

The drivers are bundled and installed together with a HyperTerminal program, “TeraTerm”, and IAR Embedded Workbench for the Renesas RL78 microcontroller.

## Installation Procedure

1. Run “*ADF7xxxMB4z\_Evaluation\_Suite\_Install\_rXpX.exe*” to install the evaluation software for the ADF7xxxMB4z. The install will create the relevant shortcuts on the start menu for easy access to the software and documentation.
2. The **install software will** initially load with the following welcome Figure 1. Click “Next”

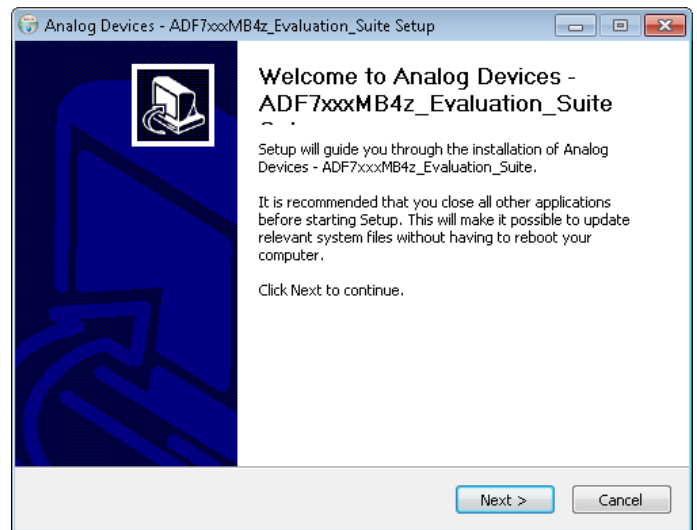

Figure 1

3. Once components to be installed are selected as in Figure 2 click “Install”.

Install components:

- a. Install ADF7xxxMB4z USB Drivers
- b. Install HyperTerminal Program “TeraTerm”
- c. Install IAR RL78 Embedded Workbench

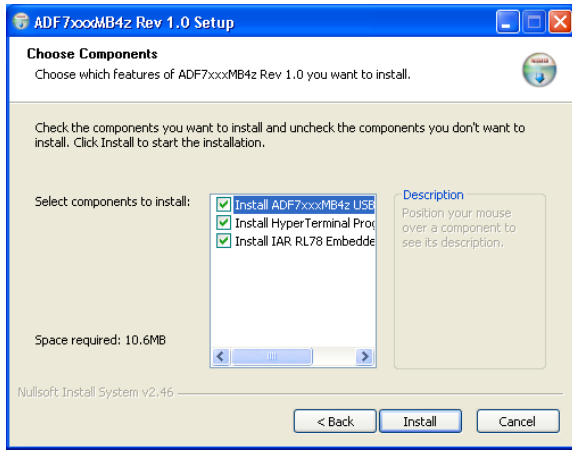

Figure 2

4. If “Install ADF7xxxMB4z USB Drivers” component is selected the screen in (Figure 3) will appear. Click “Next” to install the USB Drivers. Once the Drivers are installed click “Finish” (Figure 4).

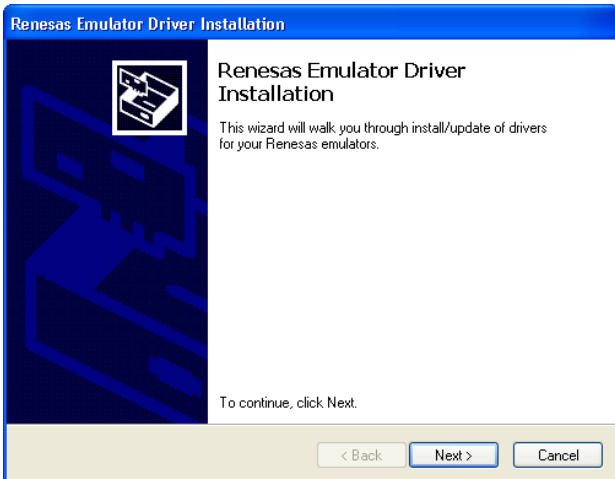

Figure 3

Figure 4

5. If “Install HyperTerminal Program (TeraTerm)” component is selected, a TeraTerm software user License agreement will appear as in. If you agree to the terms of the license, click “I Agree”.

Figure 5

# ADF7xxxMB4z Evaluation Hardware

This section gives a description of all hardware sections on the ADF7xxxMB4z motherboard. The board is designed for evaluating the ADF7023 transceiver along with allowing the user to do their own code development on the on-board Renesas RL78.

This section will describe in detail

- USB/Communication Ports
- Reset Button
- Programming and TK debugger interface
- ADF7023 Daughter Card Connection
- ADF7023 external Interfaces
- ADF7023 Powering options
- SD Micro Card
- Ethernet Port
- Dot Matrix LCD
- Touch Screen Controller

## USB PORTS

The ADF7xxxMB4z has 2 USB connections on board.

### Main USB

The USB connection on the top side of the board is the main USB/Communication port connection. (Figure 6) This port

- Provides the main COM Port for the HyperTerminal program.
- Is used for uploading the .hex code to the uC.
- Is used as the TK debugger when debugging user code in IAR
- Provides Power to the PCB

Figure 6

### Secondary USB

The secondary USB connection is on the underside of the board (Figure 7). While the uC is in debug mode, the Com Port interface cannot be used in by the main USB port and therefore the only option is to use a second Com Port while debugging serial communications.

This port does NOT power the Motherboard however and so requires a second USB lead to go from it to the PC. This USB port creates a virtual Com Port with an FTDI FT232 chip.

Figure 7

### Reset

The reset switch on the board provides a hardware reset of the on-board Renesas uC (Figure 8). The code on the uC will be reset and start again from the beginning once the Reset switch is released.

Figure 8

## Programming and TK interface

The TK interface can be used in IAR to provide on-board debug capabilities, avoiding the need for a JTAG debugger. To put the device board into debug mode, ensure dipswitch 1 is in the ON position and that all the others are OFF, as per (Figure 9)

Figure 9 (Debug Mode Setup)

## ADF7023 Daughter Card Connection

All of the new generation ADF7xxx daughter cards plug into the ADF7xxxMB4z Motherboard. The card plugs into the headers highlighted in (Figure 10). Ensure the Motherboard is powered down before connecting the daughter board to the Motherboard. Care must be taken when connecting and disconnecting the two boards to avoid damaging the headers on each of the boards.

Figure 10 (ADF7xxx Daughter Board Headers)

## ADF7xxx External Interfaces

### SMA Connectors

The ADF7xxxMB4z has 3 SMA connectors available for operating the transceiver in SPORT mode.

- CLK SMA – This is the Clock connection used for clocking in and out the SPORT Mode data to and from the ADF7xxx.
- DR SMA – This is the pin where the Received data appears in SPORT Mode.
- DT SMA – This is the pin where the data to be transmitted is passed to while in SPORT Mode.

CLK, DR and DT are labelled in (Figure 11).

Figure 11 (Sport Mode SMA Headers)

## ADF7xxx Connections Header

All of the interface connections on the ADF7xxx are available on header J2. This provides an external interface to the ADF7xxx where connections can be made to an external uC or alternative testing hardware.

The connections, in pin order are as follows:

1. CSN
2. MOSI
3. MISO
4. SCLK
5. IRQ1
6. IRQ2
7. XOSC
8. GND
9. VDDRF
10. CLK
11. DT
12. DR
13. GP6
14. P.25
15. ATB1
16. GND

This header is shown in (Figure 12).

Figure 12 (ADF7xxx Connections Header)

## ATB Header

All of the ATB pins on the ADF7xxx come out to a single interface header. This header is not populated on the board.

The Connections, in pin order, are as follows:

1. ATB1
2. GND
3. ATB2
4. GND
5. ATB3
6. GND
7. ATB4
8. GND

This header is shown in (Figure 13).

Figure 13 (ATB Connections Header)

### ADF7xxx Powering Options

The ADF7xxx Daughter board has 4 different powering options.

It can be powered from the main USB, a 3.6V battery, SMA connector, or directly from Header J9.

#### Powering the ADF7xxx from the USB

The default method is to power the board from the main USB. For this option ensure the jumper is in position 1 (Figure 14)

Figure 14 (Default Jumper configuration)

#### Powering the ADF7xxx from the Battery

To power the ADF7xxx and all other components on the ADF7xxxMB4z ensure the 3.6V battery is inserted and that the jumper is in the default position as in (Figure 14).

#### Powering the ADF7xxx from the SMA connector

Ensure the VDD\_RF SMA Power lead is connected to the board and that the Jumper on header J9 is in the correct position as in (Figure 15).

**WARNING:** The SMA connection powers the ADF7xxx directly and is not regulated. Please ensure that the MAX Power ratings on the ADF7xxx Datasheet are abided by. If these Max Ratings are not adhered to the ADF7xxx daughter card may be permanently damaged as a result. Note also that the center pin of the SMA is the positive and the shielding is ground. Care must be taken to ensure reverse polarity does not occur as there is no protection circuitry in place for such an event.

Figure 15 (Powering externally from an SMA Cable)

### Powering the ADF7023 directly from Header J9

The ADF7xxx can be powered directly from the Header J9. This can be achieved by connecting placing a connector directly on the VDDRF pin and ground. Refer to Figure 60 for connection orientation.

Figure 16 (Powering the ADF7023 Directly from Header J9)

**WARNING:** Direct connection to Header J9 powers the ADF7xxxDB directly and is not regulated. Please ensure that the MAX Power ratings on the ADF7xxx Datasheet are abided by and that care is taken to ensure correct polarity as indicated in (Figure 16). If these Max Ratings are not adhered to or polarity is reversed, the ADF7xxx daughter card may be permanently damaged as a result.

### SD Micro Card

The micro SD card slot is situated on the underside of the ADF7xxxMB4z. This card can be used to provide extra memory for larger applications. The SD card slot is connected directly to the SPI lines of the on-board uC. Please refer to the *Schematics* section of the document for more information on the connection details. (Figure 17) shows the location of the micro SD card slot on the ADF7xxxMB4z motherboard.

Figure 17

### Ethernet Port

The Ethernet port connection is provided in the development kit and can be used in applications requiring a physical connection to Ethernet. This is directly controlled by Microchip’s ENC424J600 Stand-Alone 10/100 Ethernet Controller and this is interfaced with the on-board uC through SPI. Please refer to the *Schematics* section for further connection information.

### Dot Matrix LCD

The ADF7xxxMB4z has DOGM128E 128 x 64 Dot Matrix LCD. This can be used by the developer in battery applications where USB communications is not achievable. Future code revisions will have more screen capabilities with the selection menu available on screen, to allow the user to operate the ADF7xxx completely on battery power.

### Touch Screen Controller

A Touch Screen Controller is available on the ADF7xxxMB4z. This is an ADI AD7879 resistive touch screen controller. The communications between this controller and the host uC is done through the SPI interface. This hardware allows the developer to evaluate touch screen capabilities in their application.

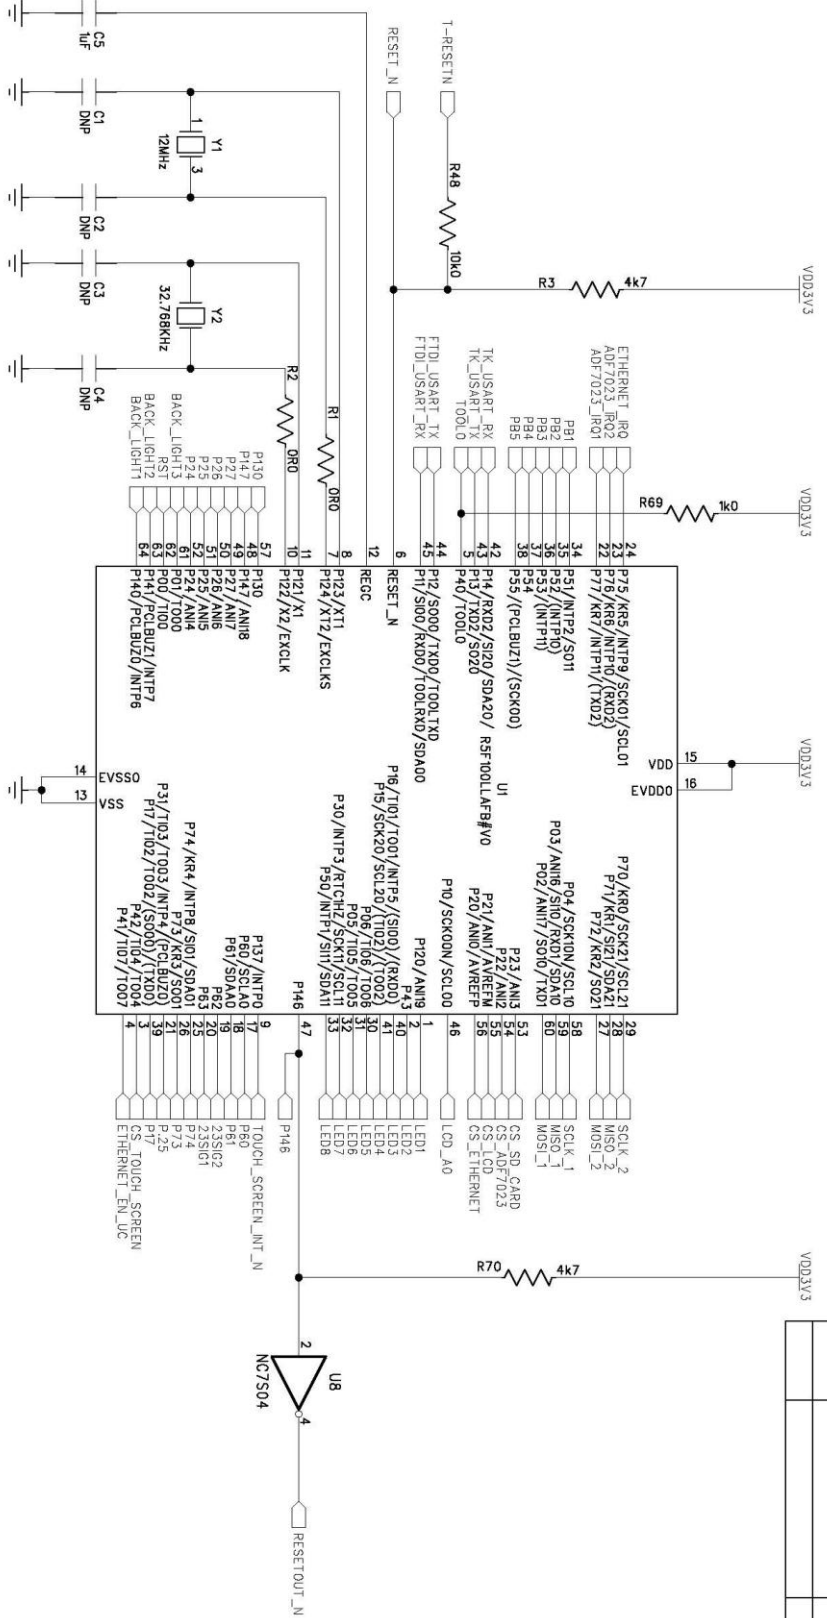

## Low Power Options

The ADF7xxxMB4z can operate in low power mode. In this mode the only peripherals available will be the host uC, the ADF7xxx and the Low power Screen.

The other peripherals are controlled by a chip select line from the host uC.
