Keysight Streamline Series VNA

The freedom of portable network analysis doesn't have to mean a compromise in performance. The B-models of the Keysight Streamline Series VNAs unlock the full performance of the network analyzer hardware with fast measurements over Thunderbolt 3 connections to your host PC. Gain confidence in your measurements with best-in-class performance offering fast, reliable, and repeatable results. Explore the complete characterization of your devices with a rich portfolio of software applications that transform the compact network analyzer into a complete RF measurement solution.

The P50xxB Series offers the performance required for testing passive components, amplifiers, mixers or frequency converters. The vector network analyzer (VNA) provides best-in-class key specifications such as dynamic range, measurement speed, trace noise and temperature stability. Choose from 2- or 4-port models up to 53 GHz, or 6-port models up to 20 GHz.

The P93xxB Series provides excellent performance in general-purpose network analysis for passive components. With software applications like enhanced time domain analysis with TDR and automatic fixture removal, you can easily characterize passive components with the same performance of a benchtop setup. Choose from 2-port models up to 44 GHz or 4-port models up to 20 GHz.

The Streamline Series utilizes the same measurement science as other Keysight VNAs such as the PNA, ENA and PXI VNA. A common software platform makes it easy to choose the right level of performance to match budget and measurement needs. This commonality guarantees measurement consistency, repeatability, and a common remote-programming interface across multiple instruments in R&D and manufacturing.

This configuration guide describes standard configurations, options, accessories, and compatible peripherals for the P93xxB and P50xxB Keysight Streamline Series vector network analyzer (VNA).

Measurement Application Software

Solid black series name indicates the feature is available on that series, while gray series name with strikethrough indicates the feature is not available with that series. For example:

P50xxB Series: Available with P500xB or P502xB Series

~~P93xxB Series~~: Not available with P937xB or P938xB Series

Automatic fixture removal (S97007B)

P93xxB Series

P50xxB Series

Many devices do not have coaxial connectors and are put in fixtures in order to measure them in a coaxial environment. Accurately removing the effects of the fixture is required to get a good measurement of the device under test (DUT). This application adds a powerful application wizard to guide you through characterizing a fixture and removing it from the measurement. Devices can be single-ended or differential. Files can be saved in a variety of formats for later use in ENA, PNA, PXI VNA, Streamline Series VNA, ADS, and PLTS.

Time domain analysis (S97010B)

P93xxB Series

P50xxB Series

This application enables the analyzer to view reflection and transmission responses in time or distance. Use time domain to tune filters, gate out the response of fixtures and cables, characterize the impedance of transmission lines and more.

Enhanced time domain analysis with TDR (S97011B)

P93xxB Series

P50xxB Series

This application enables the analyzer to perform enhanced time domain analysis for high-speed data applications. All functionality of the S97010B are included (TDR/TDT mode). In addition, the S97011B enables more detailed measurements and evaluations, such as eye-diagram/mask modes, without adding PLTS software. Jitters and/or emphasis/equalization capabilities enables simulation of real-world signals and environment. S97011B covers up to 53 GHz bandwidth with 8.42 psec rise time. Full calibration is available and automatic deskew ensures easy removal of fixture and probe effects. To get the best accuracy, mechanical calibration kits or ECal with DC option (i.e. N443xD or N469xD with Option 0DC) are recommended.

Real time S-parameter and power measurement uncertainty (S97015B)

P93xxB Series

P50xxB Series

This application provides uncertainties for both S-parameter and power measurements on the P50xxB. The real-time display of the uncertainty associated with power and S-parameter traces increases the confidence in the reproducibility of measurements. This allows users to implement pass/fail tests easily because now the instrument quantifies the gray region that is in between a full pass or a full fail, apply more realistic limit lines which can increase the production yield and reduce the defect percentage on the finished products. This application easily establishes a metric to quantify the quality of the measurement process, so your company's quality control procedures are simplified. It includes the uncertainty information for most Keysight calibration kits and provides national metrology institute traceability through Keysight's calibration kits. This application also helps you to include uncertainty information for your product's specifications and data sheets.

Basic Pulsed-RF measurements lite (S970240B/S970241B)

P93xxB Series

P50xxB Series

This application enables internal pulse generators of P500xB or P502xB Series that can be used to control the internal pulse modulators, and it provides an integrated pulse application that uses the wideband-detection method.

The pulse application provides an easy way to set up point-in-pulse measurements with pulse width as narrow as 50 us, and pulse-profile measurements with 1 us minimum timing resolution. Using the built-in pulse modulators, the P50xxB Series VNAs are complete pulsed-RF measurement solutions, eliminating the need for external test sets and pulse generators. S97024xB also controls external pulse generators and modulators and can synchronize to external master pulses. Y1731A I/O Adapter Module is recommended to access pulse signals with SMB connectors if using external master pulses or external pulse modulators.

S970240B is available with P50xxB up to 20 GHz (20 GHz models or less), and S970241B is available for P50xxB greater than 20 GHz. Hardware options are not needed for pulsed-RF measurements with P50xxB.

S97024xB is a subset of S97025xB, so they should not be installed together.

Basic Pulsed-RF measurements (S970250B/S970251B)

P93xxB Series

P50xxB Series

This application enables internal pulse generators of P500xB or P502xB Series that can be used to control the internal pulse modulators, and it provides an integrated pulse application that uses the wideband-detection method.

The pulse application provides an easy way to set up point-in-pulse measurements with pulse width as narrow as 1 us, and pulse-profile measurements with 40 ns minimum timing resolution. Using the built-in pulse modulators, the P50xxB Series VNAs are complete pulsed-RF measurement solutions, eliminating the need for external test sets and pulse generators. S97025xB also controls external pulse generators and modulators and can synchronize to external master pulses. Y1731A I/O Adapter Module is recommended to access pulse signals with SMB connectors if using external master pulses or external pulse modulators.

S970250B is available with P50xxB up to 20 GHz (20 GHz models or less), and S970251B is available for P50xxB greater than 20 GHz. Hardware options are not needed for pulsed-RF measurements with P50xxB.

Noise figure measurements with vector correction (S97029B)

P93xxB Series

P50xxB Series

This software application enables high-accuracy noise figure and noise-power measurements of amplifiers, frequency converters, and mixers, utilizing Keysight's unique vector-source-correction technique that uses Keysight N469xD Series ECal module as a source-impedance tuner¹ to remove the effects of imperfect system-source match. This approach yields accuracy that surpasses that provided by the Y-factor method and other cold-source implementations, especially for in-fixture, on-wafer, and automated-test environments. S97029B controls N469xD Series ECal modules configured as impedance tuners for use with the P50xxB Series VNA.

A scalar-calibrated method is also available that offers less accuracy but is faster and does not require an impedance tuner. This method requires an external switch to isolate the P50xxB's source signal during noise figure measurements. A 50-ohm load must be connected to the DUT's input using the switch.

The instrument's standard receivers are used for noise figure measurements with the S97029B. An external preamplifier, filter(s) and switches are required for devices with < 30 dB of excess noise (gain plus noise figure in dB). Y1731A I/O Adapter Module is recommended for synchronized measurements using the P50xxB VNA and external switches. A typical block diagram of vector-calibrated noise figure measurements is shown.

For calibration, a standard mechanical cal kit or ECal module is required for the S-parameter portion of the cal (an ECal used as a tuner cannot be shared for calibration). To calibrate a standard receiver for noise figure measurements, a power meter/sensor is required. A 346-series noise source (Keysight 346C or 346C-K01 recommended) can be used for noise calibration of the instrument's receiver, when a preamplifier is located before the receiver. All calibration accessories and external hardware must be ordered separately.

Noise figure measurements with the P50xxB are verified between 50 MHz and 45 GHz.

1. 8509x, N443xD or N755xA Series ECal modules are not supported.

Scalar mixer/converter measurements (S97082B)

P93xxB Series

P50xxB Series

The S97082B provides frequency offset mode (FOM) to set the frequency of the VNA's internal source(s) independently from where the receivers are tuned, and to configure external sources using External Device Configuration. This functionality is also included with S97029/083/084/086/089/S97090xB.

With a simple setup and calibration, this application delivers the highest accuracy for scalar conversion-loss/gain measurements by combining one-port and power-meter calibrations to remove mismatch errors. S97082B provides an intuitive and easy-to-use user interface for setting up mixer and converter measurements, with single or dual conversion stages. It can control external signal generators for use as LO signals. Supported external sources include the Keysight ESG, PSG, EXG, and MXG Series, as well as other SCPI-controlled signal generators.

S97082B is compatible with S97084B, which enables measurements of converters with internal LOs.

Vector and scalar mixer/converter measurements (S97083B)

P93xxB Series

P50xxB Series

This application includes the scalar mixer/converter plus phase (SMC+Phase) measurement class that provides fully calibrated conversion gain/loss, relative phase, and absolute group delay measurements of mixers and converters without the need for reference or calibration mixers. Eliminating the calibration mixer requires a U9391C/F/G comb generator¹ and an external DC power supply capable of sourcing +15 V and 300 mA for U9391C/F or 800 mA for U9391G. A macro-based series-reference-mixer version of VMC is also included for measuring the phase difference between multiple paths or devices, or for measuring phase shifts within the frequency-converting device. The macro also supports characterization of the calibration mixer that is supplied by the user.

SMC+Phase with the S97083B provides an intuitive and easy-to-use user interface for setting up mixer and converter measurements, with single or dual conversion stages. It can control the analyzer's built-in source(s) as well as external signal generators for use as LO signals. Supported external sources include the Keysight ESG, PSG, EXG, and MXG Series, as well as other SCPI-controlled signal generators. S97083B is a superset of S97082B, so they should not be installed together. S97083B is compatible with S97084B, which enables measurements of converters with internal LOs.

1. When a comb generator is used as a phase reference for calibration and the start frequency of the measurement is less than 630 MHz, a user-supplied calibration mixer is required.

Embedded LO capability (S97084B)

P93xxB Series

P50xxB Series

This application tunes the analyzer's receivers to the output frequency of the converter under test without the need for access to internal LOs or a common reference signal. S97084B is intended to work with S97082B and S97083B measurement applications.

Gain compression measurements (S97086B)

P93xxB Series

P50xxB Series

The gain compression application (GCA) provides input power, output power, gain, and phase at the compression point of an amplifier or frequency converters, over a specified frequency range. GCA's SMART Sweep is very fast and easy-to-use. GCA also includes a guided calibration that corrects for absolute power levels, frequency response, and mismatch errors.

Source phase control (S97088B)

P93xxB Series

P50xxB Series

This application allows users to set calibrated, arbitrary phase differences between two internal sources with the P502xB's option 402 (internal second source option), or multiple instrument measurements using two P50xxB VNAs with S97551B. The phase difference can be fixed or swept between two specified phase values. S97088B also controls the relative power level between the sources using the receiver-leveling feature. S97088B is targeted for active-load control, where the analyzer provides a precise, electronically settable impedance to the output port of a device, while gain and output power are measured. This capability can be combined with external load-pull software to create traditional load-pull power contours.

Differential and I/Q device measurements (S97089B)

P93xxB Series

P50xxB Series

This application combines source-phase control of multiple internal or external sources with frequency-offset mode, enabling simplified test of I/Q modulators/converters and differential mixers, and harmonic measurements of differential amplifiers. The phase difference between sources can be fixed (for example, at 90 or 180 degrees), or swept between two specified phase values. Providing accurate control of the relative phase between sources eliminates the need for hybrid couplers and baluns to create quadrature or differential signals. After achieving the desired phase alignment, the instrument's receivers can be tuned to all frequencies needed to characterize the DUT. On an I/Q modulator for example, measurements can be made of both the desired and suppressed conversion bands, along with LO leakage, harmonics and other spurious signals. Phase sweeps can be used to determine a DUT's phase imbalance versus frequency. Users can specify measurements with individual receivers or multiple receivers combined with a wide range of mathematical operators. Power measurements can employ match correction for increased accuracy. S97089B works on the P502xB with option 402 (internal second source option), or multiple instrument measurements using two P50xxB VNAs with S97551B.

Spectrum analysis (S97090xB)

P93xxB Series

P50xxB Series

The spectrum analyzer (SA) application adds high-performance microwave spectrum analysis to P50xxB VNAs. With fast stepped-FFT sweeps resulting from optimized data processing, the SA application provides quick spurious searches over broad frequency ranges. Simultaneous spectrum measurements can be done using test and reference receivers. This multi-channel SA can be used with the internal swept-signal generators for efficient measurements of spurious signals emanating from mixers and frequency converters. The SA application employs source-power and receiver-response calibration as well as fixture de-embedding, providing in-fixture and on-wafer spectrum measurements with the highest level of accuracy. Accurate and fast noise power ratio (NPR) measurement capability is also included in this software application. It provides the ability of setting up and controlling of external signal generator/arbitrary waveform generators and performing the calibration of the flatness of a wideband signal and distortion signals in notches and achieving very fast NPR measurements. Optional external attenuators should be connected to the VNA's test ports to avoid receiver compression when measuring large signals. The upper frequency range of the SA application is determined by the installed SA license or the stop frequency of the instrument, whichever is smaller. There are several frequency choices intended for standalone instruments: S970900B to 4.5 GHz, S970901B to 6.5 GHz, S970902B to 9 GHz, S970903B to 14 GHz, S970904B to 20 GHz, S970905B to 26.5 GHz, S970906B to 32 GHz, S970907B to 44 GHz, and S930908B to 53 GHz.

True-mode stimulus (S97460B)

P93xxB Series

P50xxB Series

The application provides mismatch-corrected true-mode (true differential mode and true common mode) stimulus and enables accurate balanced measurements under real operating conditions. It also provides balanced measurements with forward-only sweeps, reverse-only sweeps, and frequency or power sweeps with arbitrary phase and amplitude offsets.

S97460B works on the P502xB with option 402 (internal second source option), or multiple instrument measurements using two P50xxB VNAs with S97551B.

Multiple instrument measurements (S97551B)

P93xxB Series

P50xxB Series

Keysight Streamline Series VNA offers a capability to extend the number of ports for your measurements by using up to two VNA instruments. The instruments may be identified as one VNA by the firmware on an external host PC. At least one VNA instrument connected to your PC must have one S97551B license to maintain multiport capabilities with multiple instruments.

The frequency of the multiport array is determined by the lowest frequency instrument configured in the array. For example, a 6-port analyzer configuration using a P9372B (9 GHz) and a P9384B (20 GHz) would have a maximum frequency of 9 GHz when performing 6-port measurements. This behavior extends to other measurement application software (S97xxxB). A 4-port analyzer configuration using a P5002B (9 GHz) without SA software and P5004B (20 GHz) with S970904B (SA software up to 20 GHz) would have a maximum frequency of 9 GHz for S-parameter and SA measurements. In a multiport configuration, only one instrument must have a valid license of S97xxxB for these capabilities to function in multiport mode.

Each instrument is connected into the array with Keysight cables. A Y1701A Multiple USB instruments configuration kit must be ordered separately for connection of two 2-port VNA (P937xB or P500xB with Y1701A Option 002) or two 4- or 6-port VNA (P938xB or P502xB with Y1701A Option 002 or 003).

While all models of P937xB and P938xB, or P500xB and P502xB Series can be connected for multipoint configurations, P937xB (or P938xB) and P500xB (or P502xB) cannot be combined to configure a multipoint VNA due to hardware differences.

Figure 5. 4-port configuration using two P9377B VNAs (left), 6-port configuration using 2-port P9374B and 4-port P9384B (right).

For example, two cal sets with independent test ports can be combined as one cal set with a greater number of test ports. The software also offers a way to re-calibrate using a certain set of test ports to refresh the cal set.

At least one ECal module is required for the operation of S97552B.

Multipoint calibrated measurements with switch instruments (S97553B)

---------------	---------------

This application provides a macro which enables full multipoint error correction and measurement capabilities using external switch instruments such as the P9164A/B or P9165A/B USB Solid-state Switch Matrix. The software delivers an easy-to-use measurement wizard that simplifies measurement procedures and reduces the setup time of complicated multipoint measurements. Measured multipoint S-parameters are displayed in the VNA viewer.

Multipoint configurations using up to two Streamline Series VNAs and up to two switch matrices are supported.

Only the 4-port ECal modules (i.e. N4431/32/33D) are supported for multipoint calibration with the S97553B.

PathWave Vector Signal Analysis (89600 VSA) software

P93xxB Series

P50xxB Series

PathWave VSA software is a comprehensive set of tools for demodulation and vector signal analysis. Supporting P500xB or P502xB, the software provides the flexibility and sophisticated measurement tools essential to find and fix signal problems. The multi-channel measurement capability with the P50xxB VNA can configure, execute and display multiple measurements simultaneously to characterize numerous signals. Powerful display tools enable comparisons and correlation of results from different measurements.

S97090xB spectrum analysis software and PathWave Vector Signal Analysis (89600 VSA) software are required to enable vector signal analysis using the P50xxB. The maximum bandwidth of the P50xxB is 29 MHz. To synchronize to external vector signal generators, Y1730A-800/801/810 cables are recommended for connection with 10 MHz external reference ports (Ref In/Ref Out) of the P50xxB.

Refer to www.keysight.com/find/89600 to learn more about 89600 VSA software.

Vector Network Analyzer (VNA) simulator (S9405xB)

VNA simulator runs on your PC and simulates operations of Keysight's latest VNAs (PNA/ENA/PXI or Streamline Series VNA), eliminating the need for a VNA for your test program development. The simulator has standard and advanced versions. The standard version (S94050B) supports operations of standard S-parameter measurement class. The advanced version (S94051B) gives access to all advanced capabilities with S97xxxB software (ex. spectrum analysis) except S97007B, S97552B or S97553B software for Streamline Series VNAs.

S9405xB is available on subscription licenses only.

Direct Receiver Access (DRA) Configurations

Keysight Streamline Series VNAs support direct receiver access (DRA) configurations to flexibly set up test systems with optimized performance by integrating with external components¹ such as booster amplifiers, attenuators, or directional couplers. This function (included in the VNA firmware) combines three physical test ports of the Streamline Series VNA and defines them as a single logical port. You can perform measurements including calibration and post processing using the logical ports.

DRA configuration with high-power

One example using the DRA configuration is S-parameter measurements with high power. When you need an input level higher than the analyzer's source can provide, pre-amplifiers are necessary to boost the power level prior to the DUT. However, the reference signal is measured before the booster amplifier with a standard configuration of a 2-port VNA, and temperature drift or high reverse isolation of a booster amplifier will prevent accurate reflection measurements of the DUT's input.

A typical configuration for high-power measurements with the 4-port VNA is shown. A 4-port VNA (ex. P938xB or P502xB with Option 400/402), or a 4-port VNA² using two 2-port VNAs (ex. P937xB or P500xB with Option 200) are needed to setup the DRA configuration on port 1. Reflected and transmitted signals of the DUT are detected with all the logical receivers, and the VNA firmware provides measured high-power S-parameters.

External components should be selected based on their high-power limits or frequency range specifications. Be sure that these components can handle the output power level of the booster amplifier.

1. External components are not included in Streamline Series VNA. Must be purchased separately.
2. The S97551B software is required to configure a multiport VNA with multiple Streamline Series VNAs.

To attain the best mechanical rigidity for device connection, use a single cable and the appropriate special adapter set. To attain the greatest flexibility for device connection, use a cable set.

Calibration kits

Coaxial measurements

Mechanical calibration kits include standards, such as opens, shorts and loads, which are measured by the network analyzer for increased measurement accuracy.

Choose a calibration kit for each connector type to be used.

Economy, includes:

- Open standards (male and female)
- Short standards (male and female)
- Fixed-termination standards (male and female)

P50xxB Series

CalPod calibration refresh modules allow in-situ calibration refreshes to be performed at the push of a button without removing the DUT or re-connecting calibration standards. CalPods are designed for any measurement situation where it is desirable to ensure that a valid calibration is present before recording measurement data. For example, they are useful for removing environmental effects such as cable movement and thermal-based changes of cables, connectors, and adapters, as well as connector and switch-matrix repeatability errors. The modules are especially useful in temperature, or thermal-vacuum chamber testing. CalPod modules are equipped with 2.92 mm connectors.
