MCP6491/2/4

7.5 MHz, Low-Input Bias Current Op Amps

Features

- Low-Input Bias Current:
  - 150 pA (typical, T_A = +125°C)
- Low Quiescent Current:
  - 530 µA/amplifier (typical)
- Low-Input Offset Voltage:
  - ±1.5 mV (maximum)
- Supply Voltage Range: 2.4V to 5.5V
- Rail-to-Rail Input/Output
- Gain Bandwidth Product: 7.5 MHz (typical)
- Slew Rate: 6 V/µs (typical)
- Unity Gain Stable
- No Phase Reversal
- Small Packages
  - Singles in SC70-5, SOT-23-5
- Extended Temperature Range
  - –40°C to +125°C

Applications

- Photodiode Amplifier
- pH (potential of hydrogen) Electrode Amplifier
- Low Leakage Amplifier
- Piezoelectric Transducer Amplifier
- Active Analog Filter
- Battery-Powered Signal Conditioning
- AEC Q100 Qualified. See Product Identification System (Automotive)

Design Aids

- SPICE Macro Models
- FilterLab® Software
- MAPS (Microchip Advanced Part Selector)
- Analog Demonstration and Evaluation Boards
- Application Notes

Description

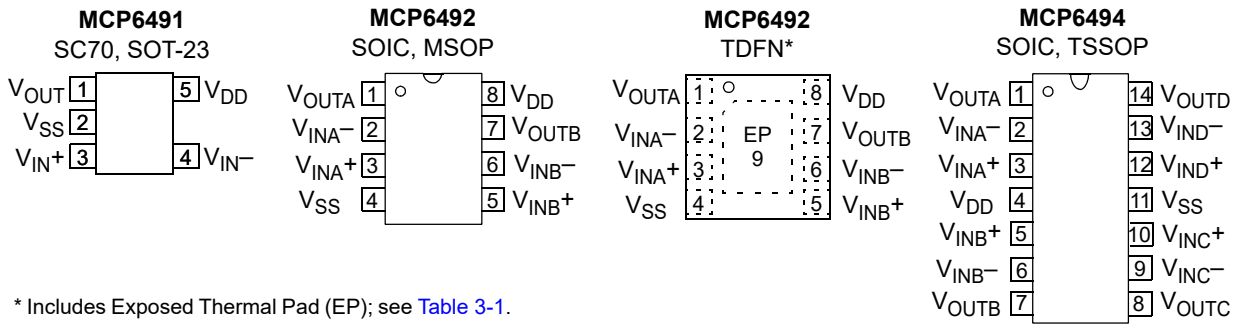
The Microchip MCP6491/2/4 family of operational amplifiers (op amps) has low-input bias current (150 pA, typical at 125°C) and rail-to-rail input and output operation. This family is unity gain stable and has a gain bandwidth product of 7.5 MHz (typical). These devices operate with a single-supply voltage as low as 2.4V, while only drawing 530 µA/amplifier (typical) of quiescent current. These features make the family of op amps well suited for photodiode amplifier, pH electrode amplifier, low leakage amplifier, and battery-powered signal conditioning applications, etc.

The MCP6491/2/4 family is offered in single (MCP6491), dual (MCP6492), quad (MCP6494) packages. All devices are designed using an advanced CMOS process and fully specified in extended temperature range from -40°C to +125°C.

Related Parts

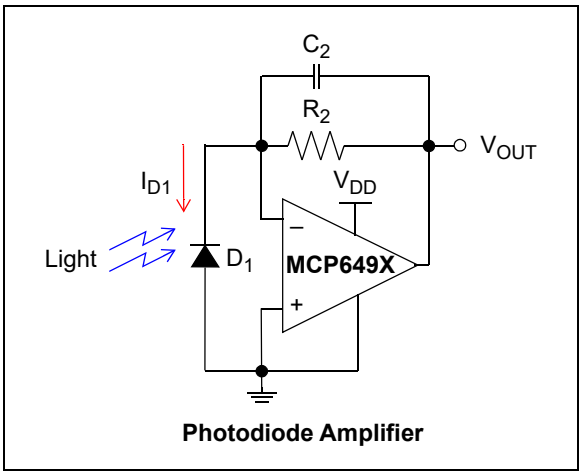
- MCP6471/2/4: 2 MHz, Low-Input Bias Current Operational Amplifiers
- MCP6481/2/4: 4 MHz, Low-Input Bias Current Operational Amplifiers

Package Types



* Includes Exposed Thermal Pad (EP); see Table 3-1.

Typical Application



Photodiode Amplifier

1.0 ELECTRICAL CHARACTERISTICS

1.1 Absolute Maximum Ratings †

$V_{DD} - V_{SS}$ 6.5V
Current at Input Pins ..... ±2 mA
Analog Inputs (V_{IN}+, V_{IN}-) (**Section 4.1.2**) ..... V_{SS} – 1.0V to V_{DD} + 1.0V
All Other Inputs and Outputs ..... V_{SS} – 0.3V to V_{DD} + 0.3V
Difference Input Voltage ..... $V_{DD} - V_{SS}$
Output Short-Circuit Current ..... continuous
Current at Output and Supply Pins ..... ±60 mA
Storage Temperature ..... -65°C to +150°C
Maximum Junction Temperature (T_J) ..... +150°C
ESD protection on all pins (HBM) ..... ≥ 4 kV

Note 1: See **Section 4.1.2, Input Voltage Limits**.

† **Notice**: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

1.2 Electrical Specifications

TABLE 1-1: DC ELECTRICAL SPECIFICATIONS

Electrical Characteristics: Unless otherwise indicated, V_{DD} = +2.4V to +5.5V, V_{SS} = GND, T_A = +25°C, $V_{CM} = V_{DD}/2$, $V_{OUT} \approx V_{DD}/2$, $V_L = V_{DD}/2$ and R_L = 10 kΩ to V_L. (Refer to Figure 1-1).

Parameters	Sym	Min	Typ	Max	Units	Conditions
Input Offset						
Input Offset Voltage	V_{OS}	-1.5	—	+1.5	mV	V_{DD} = 3.0V, $V_{CM} = V_{DD}/4$

Thermal Resistance, 14L-SOIC	θ_{JA}	—	95.3	—	°C/W	
Thermal Resistance, 14L-TSSOP	θ_{JA}	—	100	—	°C/W	

Note 1: The internal junction temperature (T_J) must not exceed the absolute maximum specification of +150°C.

1.3 Test Circuits

The circuit used for most DC and AC tests is shown in Figure 1-1. This circuit can independently set V_{CM} and V_{OUT} (refer to Equation 1-1). Note that V_{CM} is not the circuit's common mode voltage, and that V_{OST} includes V_{OS} plus the effects (on the input offset error, V_{OST}) of temperature, CMRR, PSRR and A_{OL}.

EQUATION 1-1:

$$G_{DM} = \frac{R_F}{R_G}$$

$$V_{CM} = \frac{1}{2} \times \left(V_P + \frac{V_{DD}}{2} \right)$$

$$V_{OST} = V_{IN-} - V_{IN+}$$

$$V_{OUT} = \frac{V_{DD}}{2} + V_P - V_M + V_{OST} \times (1 + G_{DM})$$

Where:

G_{DM}	=	Differential Mode Gain (V/V)
R_F	=	Feedback Resistance (Ω)
R_G	=	Gain Resistance (Ω)
V_{CM}	=	Operational Amplifier Common Mode Input Voltage (V)
V_P	=	Peak Voltage (V)
V_{DD}	=	Drain Power Voltage (V)
V_{OST}	=	Operational Amplifier Total Input Offset Voltage (mV)
V_{IN-}	=	Input Voltage (V)
V_{IN+}	=	Input Voltage (V)
V_{OUT}	=	Output Voltage (V)
V_M	=	Maximum Voltage (V)

3.0 PIN DESCRIPTIONS

Descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

MCP6491	MCP6492		MCP6494	Symbol	Description
SC70, SOT-23	SOIC, MSOP	TDFN	SOIC, TSSOP		
1	1	1	1	V_{OUT}, V_{OUTA}	Analog Output (operational amplifier A)
4	2	2	2	$V_{IN}-$, $V_{INA}-$	Inverting Input (operational amplifier A)
3	3	3	3	$V_{IN}+$, $V_{INA}+$	Non-inverting Input (operational amplifier A)
5	8	8	4	V_{DD}	Positive Power Supply
—	5	5	5	$V_{INB}+$	Non-Inverting Input (operational amplifier B)
—	6	6	6	$V_{INB}-$	Inverting Input (operational amplifier B)
—	7	7	7	V_{OUTB}	Analog Output (operational amplifier B)
—	—	—	8	V_{OUTC}	Analog Output (operational amplifier C)
—	—	—	9	$V_{INC}-$	Inverting Input (operational amplifier C)
—	—	—	10	$V_{INC}+$	Non-Inverting Input (operational amplifier C)
2	4	4	11	V_{SS}	Negative Power Supply
—	—	—	12	$V_{IND}+$	Non-Inverting Input (operational amplifier D)
—	—	—	13	$V_{IND}-$	Inverting Input (operational amplifier D)
—	—	—	14	V_{OUTD}	Analog Output (operational amplifier D)
—	—	9	—	EP	Exposed Thermal Pad (EP); must be connected to V_{SS}.

3.1 Analog Outputs

The output pins are low-impedance voltage sources.

3.2 Analog Inputs

The non-inverting and inverting inputs are high-impedance CMOS inputs with low bias currents.

3.3 Power Supply Pins

The positive power supply (V_{DD}) is 2.4V to 5.5V higher than the negative power supply (V_{SS}). For normal operation, the other pins are at voltages between V_{SS} and V_{DD}.

Typically, these parts are used in single-supply operation. In this case, V_{SS} is connected to ground and V_{DD} is connected to the supply. V_{DD} will need bypass capacitors.

3.4 Exposed Thermal Pad (EP)

There is an internal electrical connection between the Exposed Thermal Pad (EP) and the V_{SS} pin; they must be connected to the same potential on the Printed Circuit Board (PCB).

This pad can be connected to a PCB ground plane to provide a larger heat sink. This improves the package thermal resistance (θ_{JA}).

NOTES:

4.0 APPLICATION INFORMATION

The MCP6491/2/4 family of operational amplifiers is manufactured using Microchip's state-of-the-art CMOS process and is specifically designed for low-power, high-precision applications.

4.1 Inputs

4.1.1 PHASE REVERSAL

The MCP6491/2/4 operational amplifiers are designed to prevent phase reversal when the input pins exceed the supply voltages. Figure 2-32 shows the input voltage exceeding the supply voltage without any phase reversal.

4.1.2 INPUT VOLTAGE LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the voltages at the input pins (see **Section 1.1, Absolute Maximum Ratings †**).

The ESD protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors against many (but not all) overvoltage conditions, and to minimize the input bias current (I_B).

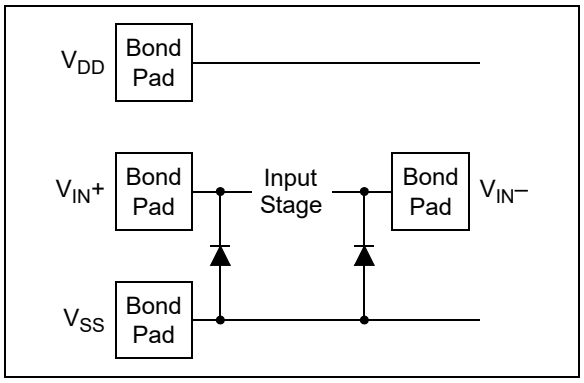

FIGURE 4-1: *Simplified Analog Input ESD Structures.*

The input ESD diodes clamp the inputs when they try to go more than one diode drop below V_{SS}. They also clamp any voltages that go well above V_{DD}. Their breakdown voltage is high enough to allow normal operation, but not low enough to protect against slow overvoltage (beyond V_{DD}) events. Very fast ESD events (that meet the specification) are limited so that damage does not occur.

In some applications, it may be necessary to prevent excessive voltages from reaching the operational amplifier inputs; Figure 4-2 shows one approach to protect these inputs.

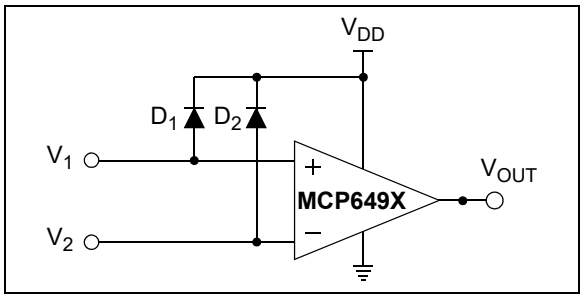

FIGURE 4-2: *Protecting the Analog Inputs.*

A significant amount of current can flow out of the inputs when the Common mode voltage (V_{CM}) is below ground (V_{SS}), as shown in Figure 2-34.

4.1.3 INPUT CURRENT LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the currents into the input pins (see **Section 1.1, Absolute Maximum Ratings †**).

Figure 4-3 shows one approach to protect these inputs. The R_1 and R_2 resistors limit the possible currents in or out of the input pins (and the ESD diodes, D_1 and D_2). The diode currents will go through either V_{DD} or V_{SS}.

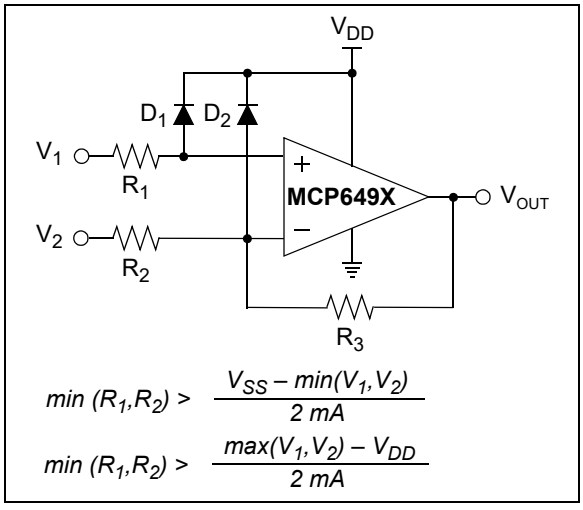

FIGURE 4-3: *Protecting the Analog Inputs.*

4.1.4 NORMAL OPERATION

The inputs of the MCP6491/2/4 operational amplifers use two differential input stages in parallel. One operates at a low Common mode input voltage (V_{CM}), while the other operates at a high V_{CM}. With this topology, the device operates with a V_{CM} up to 0.3V above V_{DD} and 0.3V below V_{SS} (refer to Figures 2-3 and 2-4). The input offset voltage is measured at $V_{CM} = V_{SS} - 0.3V$ and $V_{DD} + 0.3V$ to ensure proper operation.

The transition between the input stages occurs when V_{CM} is near $V_{DD} - 1.4V$ (refer to Figures 2-3 and 2-4). For the best distortion performance and gain linearity, with non-inverting gains, avoid this region of operation.

4.2 Rail-to-Rail Output

The output voltage range of the MCP6491/2/4 op amps is 0.007V (typical) and 5.493V (typical) when $R_L = 10\ k\Omega$ is connected to $V_{DD}/2$ and $V_{DD} = 5.5V$. Refer to Figures 2-23 and 2-24 for more information.

4.3 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback operational amplifers. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. While a unity-gain buffer (G = +1V/V) is the most sensitive to capacitive loads, all gains show the same general behavior.

When driving large capacitive loads with these operational amplifiers (e.g., > 100 pF when G = + 1V/V), a small series resistor at the output (R_{ISO} in Figure 4-4) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. The bandwidth will generally be lower than the bandwidth with no capacitance load.

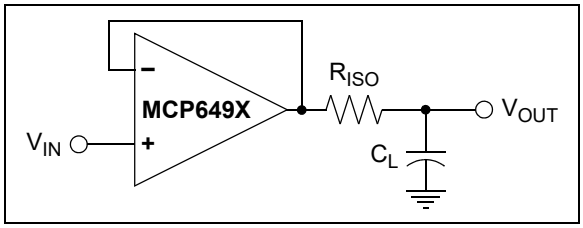

FIGURE 4-4: *Output Resistor, R_{ISO} Stabilizes Large Capacitive Loads.*

Figure 4-5 gives the recommended R_{ISO} values for different capacitive loads and gains. The x-axis is the normalized load capacitance (C_L/G_N), where G_N is the circuit's noise gain. For non-inverting gains, G_N and the Signal Gain are equal. For inverting gains, G_N is 1 + |Signal Gain| (e.g., -1V/V gives G_N = +2V/V).

After selecting R_{ISO} for your circuit, double check the resulting frequency response peaking and step response overshoot. Modify the value of R_{ISO} until the response is reasonable. Bench evaluation and simulations with the MCP6491/2/4 SPICE macro model are helpful.

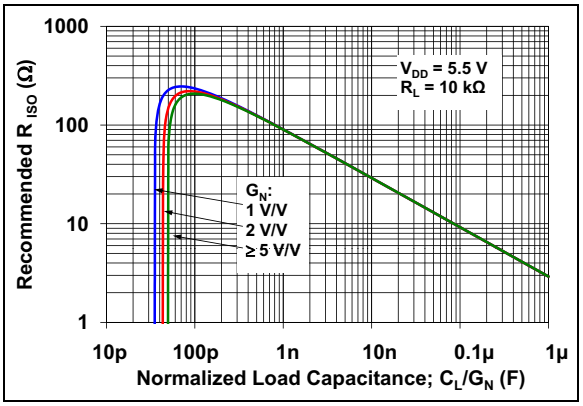

FIGURE 4-5: *Recommended R_{ISO} Values for Capacitive Loads.*

4.4 Supply Bypass

With this family of operational amplifiers, the power supply pin (V_{DD} for single supply) should have a local bypass capacitor (i.e., 0.01 µF to 0.1 µF) within 2 mm for good high-frequency performance. It can use a bulk capacitor (i.e., 1 µF or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other analog parts.

4.5 Unused Operational Amplifiers

An unused operational amplifer in a quad package (MCP6494) should be configured as shown in Figure 4-6. These circuits prevent the output from toggling and causing crosstalk. Circuit A sets the operational amplifier at its minimum noise gain. The resistor divider produces any desired reference voltage within the output voltage range of the operational amplifier, and the operational amplifier buffers that reference voltage. Circuit B uses the minimum number of components and operates as a comparator, but it may draw more current.

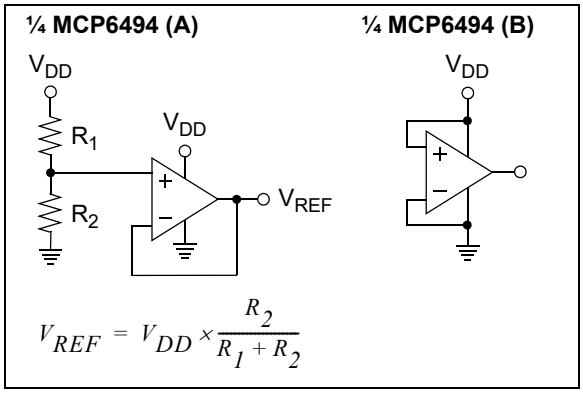

FIGURE 4-6: *Unused Op Amps.*

4.6 PCB Surface Leakage

In applications where low-input bias current is critical, PCB surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low-humidity conditions, a typical resistance between nearby traces is $10^{12}\Omega$. A 5V difference would cause 5 pA of current to flow, which is greater than the MCP6491/2/4 family's bias current at +25°C (1 pA, typical).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 4-7.

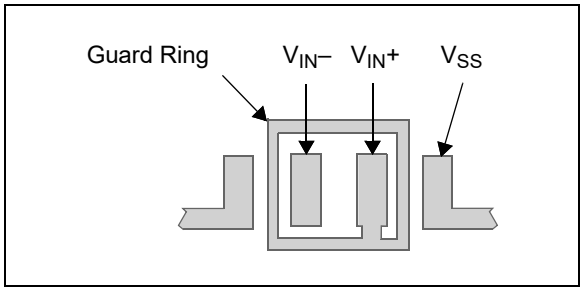

FIGURE 4-7: *Example Guard Ring Layout for Inverting Gain.*

1. Non-Inverting Gain and Unity-Gain Buffer:
   a. Connect the non-inverting pin (V_{IN}+) to the input with a wire that does not touch the PCB surface.
   b. Connect the guard ring to the inverting input pin (V_{IN}–). This biases the guard ring to the Common mode input voltage.
2. Inverting Gain and Transimpedance Gain Amplifiers (convert current to voltage, such as photo detectors):
   a. Connect the guard ring to the non-inverting input pin (V_{IN}+). This biases the guard ring to the same reference voltage as the operational amplifier (e.g., $V_{DD}/2$ or ground).
   b. Connect the inverting pin (V_{IN}–) to the input with a wire that does not touch the PCB surface.

4.7 Application Circuits

4.7.1 PHOTO DETECTION

The MCP6491/2/4 operational amplifiers can be used to easily convert the signal from a sensor that produces an output current (such as a photo diode) into a voltage (a transimpedance amplifier). This is implemented with a single resistor (R_2) in the feedback loop of the amplifiers shown in Figure 4-8 and Figure 4-9. The optional capacitor (C_2) sometimes provides stability for these circuits.

A photodiode configured in the Photovoltaic mode has zero voltage potential placed across it (Figure 4-8). In this mode, the light sensitivity and linearity is maximized, making it best suited for precision applications. The key amplifier specifications for this application are: low-input bias current, Common mode input voltage range (including ground), and rail-to-rail output.

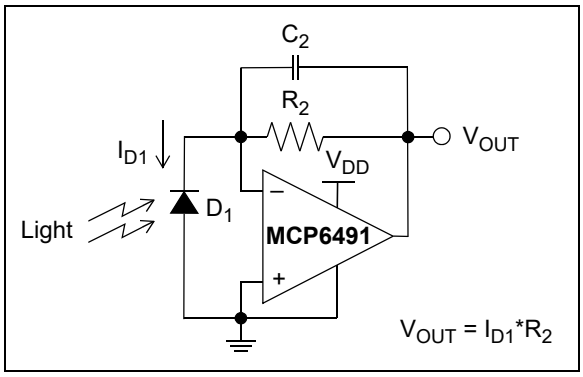

FIGURE 4-8: *Photovoltaic Mode Detector.*

In contrast, a photodiode that is configured in the Photoconductive mode has a reverse bias voltage across the photo-sensing element (Figure 4-9). This decreases the diode capacitance, which facilitates high-speed operation (e.g., high-speed digital communications). However, the reverse bias voltage also increased diode leakage current and caused linearity errors.

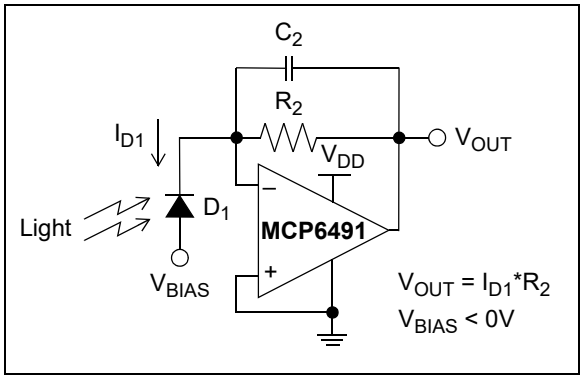

FIGURE 4-9: *Photoconductive Mode Detector.*

4.7.2 ACTIVE LOW PASS FILTER

The MCP6491/2/4 operational amplifiers' low-input bias current makes it possible for the designer to use larger resistors and smaller capacitors for active low-pass filter applications. However, as the resistance increases, the noise generated also increases. Parasitic capacitances and the large value resistors could also modify the frequency response. These trade-offs need to be considered when selecting circuit elements.

Usually, the operational amplifier bandwidth is 100x the filter cutoff frequency (or higher) for good performance. It is possible to have the operational amplifier bandwidth 10x higher than the cutoff frequency, thus having a design that is more sensitive to component tolerances.

Figure 4-10 and Figure 4-11 show low-pass, second-order, Butterworth filters with a cutoff frequency of 10 Hz. The filter in Figure 4-10 has a non-inverting gain of +1 V/V, and the filter in Figure 4-11 has an inverting gain of -1 V/V.

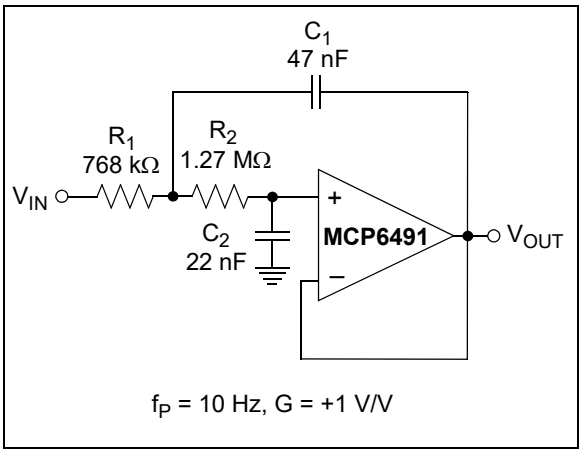

FIGURE 4-10: *Second-Order, Low-Pass Butterworth Filter with Sallen-Key Topology.*

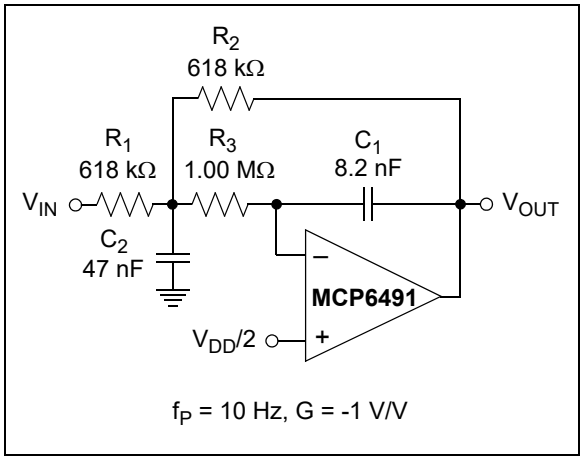

FIGURE 4-11: *Second-Order, Low-Pass Butterworth Filter with Multiple-Feedback Topology.*

4.7.3 PH ELECTRODE AMPLIFIER

The MCP6491/2/4 operational amplifiers can be used for sensing applications where the sensor has high output impedance, such as a pH electrode sensor; its output impedance is in the range of 1 MΩ to 1GΩ. The key operational amplifier specifications for these kinds of applications are low-input bias current and high-input impedance.

A typical sensing circuit is shown in Figure 4-12, it is implemented with a non-inverting amplifier which has a gain of $1+R_2/R_1$. The input voltage error due to input bias current is equal to I_B*R_{OUT}, which is amplified by $1+R_2/R_1$ at the output. To minimize the voltage error and get the V_{OUT} with better accuracy, the I_B must be small enough.

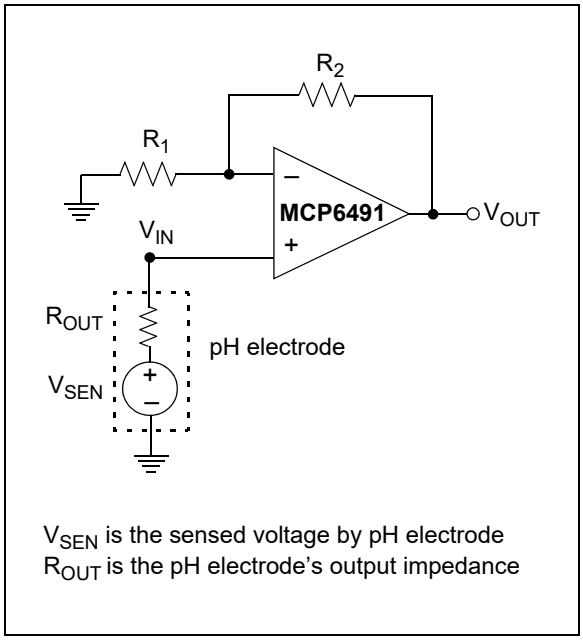

FIGURE 4-12: *pH Electrode Amplifier.*

NOTES:

5.0 DESIGN AIDS

Microchip Technology Inc. provides the basic design tools needed for the MCP6491/2/4 family of operational amplifiers.

5.1 SPICE Macro Model

The latest SPICE macro model for the MCP6491/2/4 operational amplifiers is available on the Microchip web site at www.microchip.com. The model was written and tested in PSpice, owned by Orcad (Cadence®). For other simulators, translation may be required.

The model covers a wide aspect of the operational amplifier's electrical specifications. Not only does the model cover voltage, current and resistance of the operational amplifier, but it also covers the temperature and noise effects on the behavior of the operational amplifier. The model has not been verified outside the specification range listed in the operational amplifier data sheet. The model behaviors under these conditions cannot be guaranteed to match the actual operational amplifier performance.

Moreover, the model is intended to be an initial design tool. Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specifications and characteristic curves.

5.2 FilterLab Software

Microchip's FilterLab software is an innovative software tool that simplifies analog active filter (using operational amplifiers) design. Available at no cost from the Microchip web site at www.microchip.com/filterlab, the FilterLab design tool provides full schematic diagrams of the filter circuit with component values. It also outputs the filter circuit in SPICE format, which can be used with the macro model to simulate actual filter performance.

5.3 Microchip Advanced Part Selector

MAPS is a software tool that helps semiconductor professionals efficiently identify Microchip devices that fit a particular design requirement. Available at no cost, MAPS is an overall selection tool for Microchip's product portfolio that includes analog, memory, MCUs and DSCs. Using this tool, you can define a filter to sort features for a parametric search of devices and export side-by-side technical comparison reports. Helpful links are also provided for data sheets, purchases and sampling of Microchip parts. The web site is available at www.microchip.com/maps.

5.4 Analog Demonstration and Evaluation Boards

Microchip offers a broad spectrum of Analog Demonstration and Evaluation Boards that are designed to help you achieve faster time to market. For a complete listing of these boards and their corresponding user's guides and technical information, visit the Microchip web site: www.microchip.com/analogtools.

Some boards that are especially useful include:

- MCP6XXX Amplifier Evaluation Board 1
- MCP6XXX Amplifier Evaluation Board 2
- MCP6XXX Amplifier Evaluation Board 3
- MCP6XXX Amplifier Evaluation Board 4
- Active Filter Demo Board Kit
- 5/6-Pin SOT-23 Evaluation Board, part number VSUPEV2
- 8-Pin SOIC/MSOP/TSSOP/DIP Evaluation Board, part number SOIC8EV

5.5 Application Notes

The following Microchip analog design note and application notes are available on the Microchip web site at www.microchip.com/appnotes, and are recommended as supplemental reference resources.

- **ADN003:** *"Select the Right Operational Amplifier for your Filtering Circuits",* DS21821
- **AN722:** *"Operational Amplifier Topologies and DC Specifications",* DS00722
- **AN723:** *"Operational Amplifier AC Specifications and Applications",* DS00723
- **AN884:** *"Driving Capacitive Loads With Operational Amplifiers",* DS00884
- **AN990:** *"Analog Sensor Conditioning Circuits – An Overview",* DS00990
- **AN1177:** *"Operational Amplifier Precision Design: DC Errors",* DS01177
- **AN1228:** *"Operational Amplifier Precision Design: Random Noise",* DS01228
- **AN1297:** *"Microchip's Operational Amplifier SPICE Macro Models"* DS01297
- **AN1332:** *"Current Sensing Circuit Concepts and Fundamentals"* DS01332
- **AN1494**: *"Using MCP6491 Operational Amplifiers for Photodetection Applications"* DS01494

These application notes and others are listed in:

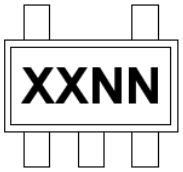
- *"Signal Chain Design Guide",* DS21825

NOTES:

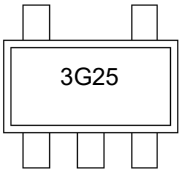
6.0 PACKAGING INFORMATION

6.1 Package Marking Information

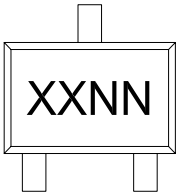
5-Lead SOT-23 **(MCP6491 only)**



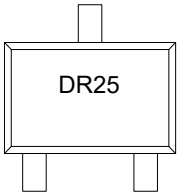
Example



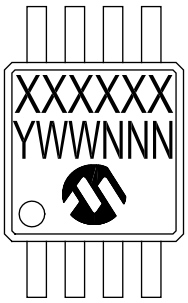
5-Lead SC-70 **(MCP6491 only)**



Example

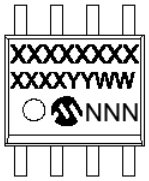


8-Lead MSOP (3x3 mm) **(MCP6492 only)**



Example

8-Lead SOIC (3.90 mm) **(MCP6492 only)**

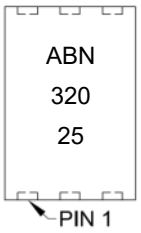


Example

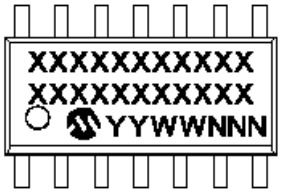
Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NN	Alphanumeric traceability code
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

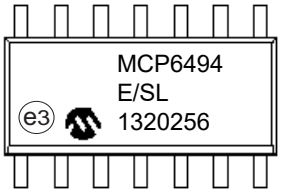
Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

8-Lead TDFN (2x3x0.75 mm) **(MCP6492 only)** Example

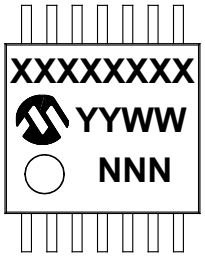


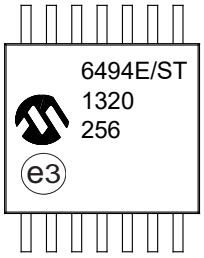
14-Lead SOIC (3.90 mm) **(MCP6494 only)** Example





14-Lead TSSOP (4.4 mm) **(MCP6494 only)** Example





Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NN	Alphanumeric traceability code
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

APPENDIX A: REVISION HISTORY

Revision D (December 2023)

The following is the list of modifications:

1. Updated the Applications section.
2. Updated Product Identification System.
3. Added Product Identification System (Automotive)
4. Updated Packaging Information section.

Revision C (June 2013)

The following is the list of modifications:

1. Added new devices to the family (MCP6492 and MCP6494) and related information throughout the document.
2. Updated thermal package resistance information in Table 1-3.
3. Added Figure 2-35 in Section 2.0, Typical Performance Curves.
4. Updated Section 3.0, Pin Descriptions.
5. Added new Section 4.5, Unused Operational Amplifiers.
6. Updated the list of reference documents in Section 5.5, Application Notes.
7. Added package markings and drawings for the MCP6492 and MCP6494 devices.
8. Updated Product Identification System.

Revision B (October 2012)

The following is the list of modifications:

1. Updated the maximum low input offset voltage value in the Features section.
2. Updated the minimum and maximum input offset voltage in **Table 1-1 "DC Electrical Specifications"**.

Revision A (September 2012)

- Original Release of this Document.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	[X](1)	-X	/XX	XXX(2)
Device	Tape and Reel	Temperature Range	Package	Class

Device:	MCP6491T:	Single Operational Amplifier (Tape and Reel) (SC70, SOT-23)
	MCP6492:	Dual Operational Amplifier (SOIC, MSOP)
	MCP6492T:	Dual Operational Amplifier (Tape and Reel) (SOIC, MSOP, 2x3 TDFN)
	MCP6494:	Quad Operational Amplifier (SOIC, TSSOP)
	MCP6494T:	Quad Operational Amplifier (Tape and Reel) (SOIC, TSSOP)
Temperature Range:	E = -40°C to +125°C (Extended)	
Package:	LTY = Plastic Small Outline Transistor, 5-lead	
	OT = Plastic Small Outline Transistor, 5-lead	
	MNY* = Plastic Dual Flat, No Lead package, 8-lead, 2x3 mm	
	SN = Plastic Small Outline, 8-lead, 3.9 mm	
	MS = Plastic Micro Small Outline, 8-lead, 3x3 mm	
	SL = Plastic Small Outline, 14-lead, 3.9 mm	
	ST = Thin Shrink Small Outline, 14-lead, 4.4 mm	
	* Y = Nickel palladium gold manufacturing designator. Only available on the TDFN package.	
Class:	Blank = Non-automotive	
	VAO = Automotive	

Examples:

a) MCP6491T-E/LTY: Tape and Reel, Extended Temperature, 5-lead SC70 package

b) MCP6491T-E/OT: Tape and Reel, Extended Temperature, 5-lead SOT-23 package

c) MCP6492-E/MS: Extended Temperature, 8-lead MSOP package

d) MCP6492T-E/MS: Tape and Reel, Extended Temperature, 8-lead MSOP package

e) MCP6492-E/SN: Extended Temperature, 8-lead SOIC package

f) MCP6492T-E/SN: Tape and Reel, Extended Temperature, 8-lead SOIC package

g) MCP6492T-E/MNY: Tape and Reel, Extended Temperature, 8-lead 2x3 TDFN package

h) MCP6494-E/SL: Extended Temperature, 14-lead SOIC package

i) MCP6494T-E/SL: Tape and Reel, Extended Temperature, 14-lead SOIC package

j) MCP6494-E/ST: Extended Temperature, 14-lead TSSOP package

k) MCP6494T-E/ST: Tape and Reel, Extended Temperature, 14-lead TSSOP package

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

2: Automotive parts (E temperature rating) are AEC Q100 qualified, Grade 1.

PRODUCT IDENTIFICATION SYSTEM (AUTOMOTIVE)

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	[X](1)	-X	/XX	XXX(2)
Device	Tape and Reel	Temperature Range	Package	Class

Device:

MCP6491T:	Single Operational Amplifier (Tape and Reel) (SC70, SOT-23)
MCP6492:	Dual Operational Amplifier (SOIC, MSOP)
MCP6492T:	Dual Operational Amplifier (Tape and Reel) (SOIC, MSOP, 2x3 TDFN)
MCP6494:	Quad Operational Amplifier (SOIC, TSSOP)
MCP6494T:	Quad Operational Amplifier (Tape and Reel) (SOIC, TSSOP)

Temperature Range: E = -40°C to +125°C (Extended)

Package:

LTY	=	Plastic Small Outline Transistor, 5-lead
OT	=	Plastic Small Outline Transistor, 5-lead
MNY*	=	Plastic Dual Flat, No Lead package, 8-lead, 2x3 mm
SN	=	Plastic Small Outline, 8-lead, 3.9 mm
MS	=	Plastic Micro Small Outline, 8-lead, 3x3 mm
SL	=	Plastic Small Outline, 14-lead, 3.9 mm
ST	=	Thin Shrink Small Outline, 14-lead, 4.4 mm
* Y	=	Nickel palladium gold manufacturing designator. Only available on the TDFN package.

Class:

Blank	=	Non-automotive
VAO	=	Automotive

Examples:

a) MCP6491T-E/LTYVAO: Tape and Reel, Extended Temperature, 5-lead SC70 package, Automotive

b) MCP6491T-E/OTVAO: Tape and Reel, Extended Temperature, 5-lead SOT-23 package, Automotive

c) MCP6492-E/MSVAO: Extended Temperature, 8-lead MSOP package, Automotive

d) MCP6492T-E/MSVAO: Tape and Reel, Extended Temperature, 8-lead MSOP package, Automotive

e) MCP6492-E/SNVAO: Extended Temperature, 8-lead SOIC package, Automotive

f) MCP6492T-E/SNVAO: Tape and Reel, Extended Temperature, 8-lead SOIC package, Automotive

g) MCP6492T-E/MNYVAO: Tape and Reel, Extended Temperature, 8-lead 2x3 TDFN package, Automotive

h) MCP6494-E/SLVAO: Extended Temperature, 14-lead SOIC package, Automotive

i) MCP6494T-E/SLVAO: Tape and Reel, Extended Temperature, 14-lead SOIC package, Automotive

j) MCP6494-E/STVAO: Extended Temperature, 14-lead TSSOP package, Automotive

k) MCP6494T-E/STVAO: Tape and Reel, Extended Temperature, 14-lead TSSOP package, Automotive

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

2: Automotive parts (E temperature rating) are AEC Q100 qualified, Grade 1.

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
