

# Single Output UPB Models

High-Efficiency, Smaller-Package 25-40 Watt, DC/DC Converters

#### **Features**

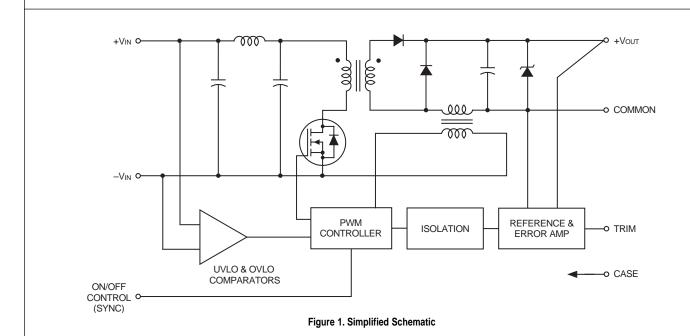

- 25/30/35/40W output power
- Standard pinout! Smaller size!
- New 2" x 3" package fits 3" x 3" sockets
- 5V, 12V and 15V outputs
- Four input voltage ranges: 10-36V, 18-36V 18-72V, 36-72V
- High efficiency (to 85%)
- Fully isolated (750Vdc min.)
- Input under and overvoltage lockout
- Thermal shutdown
- Vout trim and On/Off control
- Safety approvals pending
- . Modifications and customs available

DATEL's new UPB Model, 25-40 Watt, switching, DC/DC power converters bring you efficient "on-board" power processing in a cost-effective smaller package with a standard pinout. The 2" x 3" UPB "footprint" conforms with the industry-standard pinout and pin geometries of most 3" x 3" devices (a 33% space savings) while delivering as much as 60% more power (40W vs. 25W).

Applicable to a wide range of telecom, computer and other OEM applications, UPB Model DC/DC's operate from four input voltage ranges (10-36V for "Q12" models, 18-36V for "D24" models, 18-72V for "Q48" models, and 36-72V for "D48" models). Available output voltages are 5, 12 and 15 Volts.

For improved reliability and affordability, DATEL exploits contemporary, high-speed, automatic-assembly techniques to construct the UPB's traditional, field-proven, SMT-on-pcb designs. Devices employ corrosion-resistant steel cases with heavy aluminum top plates (traditionally referred to as baseplates). Heat generating transformer cores and power semiconductors are mounted directly to the baseplates, which also have threaded inserts for add-on heat sinks. Derating information is provided for both baseplate and ambient-temperature operation.

All devices include input pi filters, input undervoltage and overvoltage lockout, output overvoltage protection, output short-circuit current limiting, and thermal shutdown. All units are temperature cycled, burned in and automatically tested prior to shipment. UL, CSA, EN and IEC compliance testing is currently under way as are full EMI/EMC characterizations. Contact DATEL for the latest available information.

- ① Typical at TA = +25°C under nominal line voltage and full-load conditions unless otherwise noted.
- ② Ripple/Noise (R/N) measured over a 20MHz bandwidth.
- 3 10 to 100% load.
- Nominal line voltage, no-load/full-load conditions.

# **Output Power Considerations**

UPB DC/DC Converters are classified, by output power, into 25, 30, 35 and 40 Watt devices. For the single-output devices listed above, the maximum available output power is the product of the nominal output voltage and the maximum allowable output current indicated within the part number (see Part Number Structure). A UPB-5/6-Q48, for example, can source 6 Amps from its 5V output (over its entire 18-72V input voltage range) delivering an output power of 30 Watts. A UPB-5/8-D48 can deliver 40 Watts.

# **Performance/Functional Specifications**

Typical @ T<sub>A</sub> = +25°C under nominal line voltage and full-load conditions unless noted. ①

I	nput				
Input Voltage Range:					
"Q12" Models	10-36 Volts (24V nominal)				
"D24" Models	18-36 Volts (24V nominal)				
"Q48" Models "D48" Models	18-72 Volts (48V nominal) 36-72 Volts (48V nominal)				
	30-72 Volts (46V Horninal)				
Undervoltage Lockout: "Q12" Models	9 Volts				
"D24" Models	17 Volts				
"Q48" Models	17 Volts				
"D48" Models	34 Volts				
Input Current	See Ordering Guide				
Input Filter Type ②	Pi				
Overvoltage Shutdown:					
"D24" and "Q12" Models	40 Volts				
"D48" and "Q48" Models	80 Volts				
Reverse-Polarity Protection	Yes (Instantaneous, 6A maximum)				
On/Off Control (Pin 5) ③	TTL high (or open) = on, low = off				
0	utput				
Vout Accuracy (50% load)	±1%, maximum				
Temperature Coefficient	±0.02% per °C				
Ripple/Noise (20MHz BW) ②	See Ordering Guide				
Line/Load Regulation	See Ordering Guide				
Efficiency	See Ordering Guide				
Isolation Voltage ④	750Vdc, minimum				
Isolation Capacitance	130pF				
Current Limiting	Continuous, auto-recovery				
Overvoltage Protection	Clamp, 2W transorb; magnetic feedback				
Dynamic C	Characteristics				
Transient Response (50% load step)	200µsec max. to ±1.5% of final value				
Switching Frequency	165kHz				
Envir	onmental				
Operating Temperature (ambient):					
Without Derating	-25 to +40°C (model dependent)				
With Derating	-25 to +100°C				
Storage Temperature	-40 to +105°C				
Ph	ysical				
Dimensions	2" x 3" x 0.50" (50.8 x 76.2 x 12.7mm)				
Shielding	6-sided				
Case Connection	Pin 4				
Case Material	Tin-plated steel				
Baseplate Material	Gold chromate aluminum				

- ① These power converters require a minimum output loading to maintain specified regulation. For single-output devices, the requirement is 10%. Operation under no-load conditions will not damage these devices, however, they may not meet all listed specifications.
- ② Application-specific internal input/output filtering can be added upon request. Contact DATEL Applications Engineering for details.
- ③ Applying a voltage to the Control pin when no input power is applied to the converter can cause permanent damage to the converter. If desired, the On/Off function can be replaced with a Sync function. See page 6 of this data sheet for more details.
- ④ Devices can be screened for higher guaranteed isolation voltages. Contact DATEL Applications Engineering for details.

#### **Absolute Maximum Ratings**

These are stress ratings. Exposure of devices to any of these conditions may adversely affect long-term reliability. Proper operation under conditions other than those listed in the Performance/Functional Specifications Table is not implied.

Input Voltage:  "Q12/D24" Models  "Q48/D48" Models	44 Volts 85 Volts		
Input Reverse-Polarity Protection	Current must be <6A. Brief duration only. Fusing recommended.		
Output Overvoltage Protection			
5V Outputs	6.8 Volts		
12V Outputs	15 Volts		
15V Outputs	18 Volts		
Output Current	Current limited. Max. current and short-circuit duration are model dependent.		
Storage Temperature	-40 to +105°C		
Lead Temperature (soldering, 10 sec.)	+300°C		

# **Technical Notes**

#### **Floating Outputs**

Since these are isolated DC/DC converters, their outputs are "floating." Users may ground either the Common (pin 8) for normal usage or the positive side (+Output, pin 9) to effectively reverse the output polarity.

### **Filtering and Noise Reduction**

All UPB 25-40 Watt DC/DC Converters achieve their rated ripple and noise specifications without the use of external input/output capacitors. In critical applications, input/output ripple and noise may be further reduced by installing electrolytic capacitors across the input terminals and/or low-ESR tantalum or electrolytic capacitors across the output terminals. The caps should be located as close to the power converters as possible. Typical values are listed in the tables below. In most applications, using values greater than those listed will yield better results.

# To Reduce Input Ripple

"Q12, D24" Models 47μF, 50V "Q48, D48" Models 10μF, 100V

# To Reduce Output Ripple

5V Outputs  $47\mu F$ , 10V, Low ESR 12/15V Outputs  $22\mu F$ , 20V, Low ESR

In critical, space-sensitive applications, DATEL can easily tailor the internal input/output filtering of these devices to meet your specific requirements. Contact our Applications Engineering Group for additional details.

#### Input Fusing

Certain applications and/or safety agencies may require the installation of fuses at the inputs of power conversion components. For DATEL UPB DC/DC Converters, you should use slow-blow type fuses with values no greater than the following:

V <sub>IN</sub> Range	Fuse Value
"Q12"	4A
"D24"	4A
"Q48"	3A
"D48"	2A

# **Temperature Derating and Electrical Performance Curves**

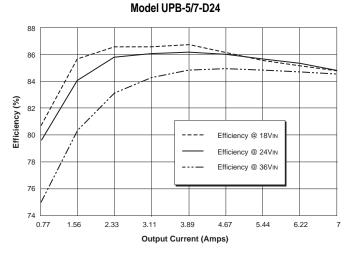

Figure 4c. Efficiency vs. Output Current and Input Voltage

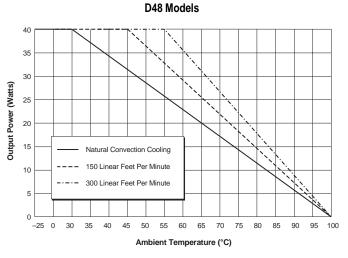

Figure 5a. Temperature Derating Without Heat Sink

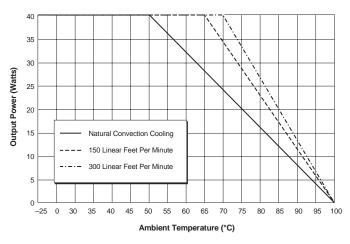

Figure 5b. Temperature Derating With Heat Sink

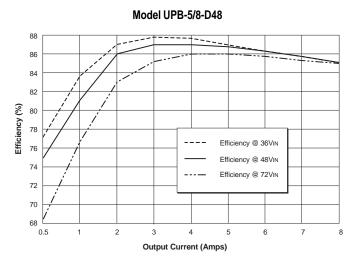

Figure 5c. Efficiency vs. Output Current and Input Voltage

# On/Off Control (Standard)

The On/Off Control pin (pin 5) may be used for remote on/off operation. A TTL logic high (+2 to +5 Volts, 250 $\mu$ A max.) or no connection (open) applied to pin 5 enables the converter. A TTL logic low (0 to +0.8 Volts, 70 $\mu$ Amax.) disables the converter. Control voltages should be referenced to pin 2 (–Input). Applying a voltage to the Control pin when no input power is applied to the converter can cause permanent damage to the converter.

# Synchronization (Optional)

In critical applications employing multiple switching DC/DC converters, it may be desirable to intentionally synchronize the switching of selected converters (so the system noise can be reduced with notch filtering) or to purposely desynchronize the converters (to lessen the current-carrying requirements on intermediate dc buses). UPB DC/DC Converters have been designed so that the On/Off Control function on pin 5 can be replaced with a Sync function. This change has to be implemented by DATEL during the product assembly process. Contact our Applications Engineering Group for additional details.

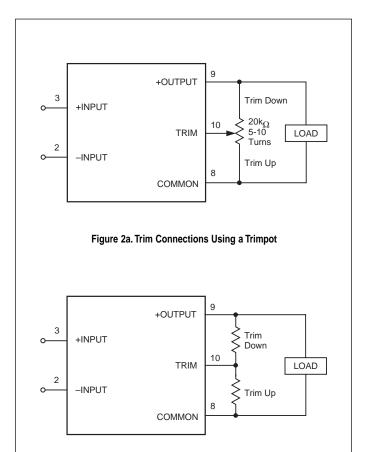

To synchronize the switching of multiple UPB converters configured with the Sync function, an external clock can be applied to pin 5 of each device. The clock should be a square wave with a maximum 1µsec "high" duration and an amplitude between +2V and +5V (see On/Off Control) referenced to pin 2 (–Input). The frequency of the synchronizing clock should be higher than that of any individual converter. Therefore, it should be 180kHz ±5kHz.

#### **Output Trimming**

 $V_{\text{OUT}}$  may be trimmed  $\pm 5\%$  via a single external trimpot or fixed resistor. The trimpot should be connected as shown in Figure 2a with its wiper connected to pin 10 (Trim). A trimpot can be used to determine the value of a single fixed resistor which should be connected as shown in Figure 2b. Connect the resistor between pin 10 (Trim) and pin 9 (+Output) to trim "down" the output voltage. Connect the resistor between pins 10 and 8 (Common) to trim "up" the output voltage. Fixed resistors should be metal-film types with absolute TCR's less than 100ppm/°C to ensure stability.

#### Case Connection

Unlike most other DC/DC converters, UPB DC/DC's do not have their metal case connected to one of their input pins. The "uncommitted" case is connected to pin 4 which, depending on your system configuration, should be connected to either +Input (pin 3) or –Input (pin 2).

# **Custom Capabilities**

DATEL's world-class design, development and manufacturing team stands ready to work with you to deliver the exact power converter you need for your demanding, large volume, OEM applications. More importantly . . . we'll do it on time and within budget!

Our experienced applications and design staffs; quick-turn prototype capability; highly automated, SMT assembly facilities; and in-line SPC quality-control techniques combine to give us the unique ability to design and deliver any quantity of power converters to the highest standards of quality and reliability.

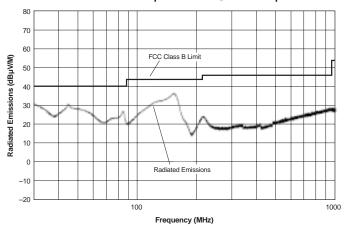

We have compiled a large library of DC/DC designs that are currently used in a variety of telecom, medical, computer, railway, aerospace and industrial applications. We may already have the converter you need.

Contact us. Our goal is to provide you the highest-quality, most cost-effective power converters available.

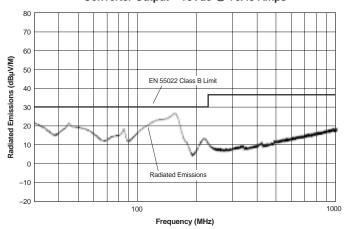

# **EMI Radiated Emissions**

If you're designing with EMC in mind, please note that all of DATEL's UPB 25-40 Watt DC/DC Converters have been characterized for radiated and conducted emissions in our new EMI/EMC laboratory. Testing is conducted in an EMCO 5305 GTEM test cell utilizing EMCO automated EMC test software. Radiated emissions are tested to the limits of FCC Part 15, Class B and CISPR 22 (EN 55022), Class B. Correlation to other specifications can be supplied upon request. Radiated emissions plots to FCC and CISPR 22 for model UPB-5/8-D48 appear below. Published EMC test reports are available for each model number. Contact DATEL's Applications Engineering Department for more details.

#### UPB-5/8-D48 Radiated Emissions FCC Part 15 Class B, 3 Meters Converter Output = +5Vdc @ +6.45 Amps

### UPB-5/8-D48 Radiated Emissions EN 55022 Class B, 10 Meters Converter Output = +5Vdc @ +6.45 Amps

# **Quality and Reliability**

The UPB Models are the latest DC/DC Converters to emerge from DATEL's new, company-wide approach to designing and manufacturing the most reliable power converters available. The five-pronged program draws our Quality Assurance function into all aspects of new-product design, development, characterization, qualification and manufacturing.

#### **Design for Reliability**

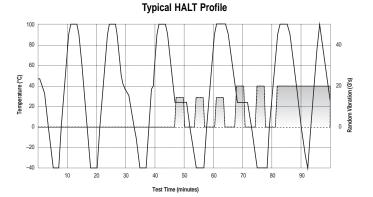

Design for Reliability is woven throughout our multi-phased, new-product-development process. Design-for-reliability practices are fully documented and begin early in the new-product development cycle with the following goals:

- 1. To work from an approved components/vendors list ensuring the use of reliable components and the rigorous qualification of new components.
- 2. To design with safety margins by adhering to a strict set of derating guidelines and performing theoretical worst-case analyses.
- 3. To locate potential design weaknesses early in the product-development cycle by using extensive HALT (Highly Accelerated Life Testing).
- To prove that early design improvements are effective by employing a thorough FRACA (Failure Reporting Analysis and Corrective Action) system.

## **HALT Testing**

The goal of the accelerated-stress techniques used by DATEL is to force device maturity, in a short period of time, by exposing devices to excessive levels of "every stimulus of potential value." We use HALT (Highly Accelerated Life Testing) repeatedly during the design and early manufacturing phases to detect potential electrical and mechanical design weaknesses that could result in possible future field failures.

During HALT, prototype and pre-production DC/DC converters are subjected to progressively higher stress levels induced by thermal cycling, rate of temperature change, vibration, power cycling, product-specific stresses (such as dc voltage variation) and combined environments. The stresses are not meant to simulate field environments but to expose any weaknesses in a product's electro/mechanical design and/or assembly processes. The goal of HALT is to make products fail so that device weaknesses can be analyzed and strengthened as appropriate. Applied stresses are continually stepped up until products eventually fail. After corrective actions and/or design

changes, stresses are stepped up again and the cycle is repeated until the "fundamental limit of the technology" is determined.

DATEL has invested in a Qualmark OVS-1 HALT tester capable of applying voltage and temperature extremes as well as 6-axis, linear and rotational, random vibration. A typical HALT profile (shown above) consists of thermal cycling (–55 to +125°C, 30°C/minute) and simultaneous, gradually increasing, random longitudinal and rotational vibration up to 20G's with load cycling and applied-voltage extremes added as desired. Many devices in DATEL's new A-Series could not be made to fail prior to reaching either the limits of the HALT chamber or some previously known physical limit of the device. We also use the HALT chamber and its ability to rapidly cool devices to verify their "cold-start" capabilities.

#### Qualification

For each new product, electrical performance is verified via a comprehensive characterization process and long-term reliability is confirmed via a rigorous qualification procedure. The qual procedure includes such strenuous tests as thermal shock and 500 hour life. Qual testing is summarized below.

#### **Qualification Testing**

Qualification Test	Method/Comments
HALT	DATEL in-house procedure
High Temperature Storage	Max. rated temp., 1,000 hours
Thermal Shock	10 cycles, -55 to +125°C
Temperature/Humidity	+85°C, 85% humidity, 48 hours
Lead Integrity	DATEL in-house procedure
Life Test	+70°C, 500 hours*
Marking Permanency	DATEL in-house procedure
End Point Electrical Tests	Per product specification

<sup>\*</sup> Interim electrical test at 200 hours

#### In-Line Process Controls and Screening

A combination of statistical sampling and 100% inspection techniques keeps our assembly line under constant control. Parameters such as solder-paste thickness, component placement, cleanliness, etc. are statistically sampled, charted and fine tuned as necessary. Visual inspections are performed by trained operators after pick-and-place, soldering and cleaning operations. Units are 100% electrically tested prior to potting. All devices are temperature cycled, burned-in, hi-pot tested and final-electrical tested prior to external visual examination, packing and shipping.

# **Rapid Response to Problems**

DATEL employs an outstanding corrective-action system to immediately address any detected shortcomings in either products or processes. Whenever our assembly, quality or engineering personnel spot a product/ process problem, or if a product is returned with a potential defect, we immediately perform a detailed failure analysis and, if necessary, undertake corrective actions. Over time, this system has helped refine our assembly operation to yield one of the lowest product defect rates in the industry.
