When selecting a standard overload, refer to the tripping curve. Determine the values of the starting current ratio  $I_A/I_N$  and the time  $t_E$  which is marked on the label of the motor. The overload must trip within the  $t_E$  time, which means that the tripping curve from cold condition must be (20% due to tolerance) below the coordination point  $I_A/I_N$  and the time  $t_E$ .

$I_A$  = Starting current of motor

$I_N$  = Rated current of motor

$t_E$  =  $t_{E}$ -time of motor

All tripping times of overload relays J7TKN-A\* are shorter than the minimum values of the  $t_E$  time for motors of protection degree EEx e acc. to EN 50019 and therefore are suitable for all motors of protection degree EEx e. For these overload relays the selection on basis of tripping curves is thereby not necessary.

Labels of tripping curves for each setting range, sized 148x105mm (self-adhesive) are available on request.

Specify type and setting range.

Temperature Compensation

In case of higher ambient temperature use the following formula:  
 (Ambient temperature - 20) × 0.125 = correction factor in % of the full load motor current

Example:  
 Ambient temperature 70°C, full load motor current 7A  
 (70 - 20) × 0.125 = 6.25%  
 Setting value: 7A + 6,25% = 7.44A
