### Brief Description

The KTS1613 is a two input, two output Smart Push-Button Reset IC. A reset pulse is generated for a fixed discharge time (400ms typ) after both manual reset inputs have been held low for the reset request time of 10s.

The KTS1613 operates over the 1.6 V to 5.5V supply voltage range, consuming less than 10 $\mu\text{A}$  of supply current at 4V.

The KTS1613 has 2 digital output pins, nSRO and SRO. nSRO is an active-low open-drain output pin. SRO is an active-high push-pull output which can be used to control a P-channel MOSFET battery disconnect switch. It features a soft turn on and turn off feature to reduce VBAT rising and falling overshoot.

The KTS1613 is available in lead-free, fully green compliant, small 10-pin UQFN 2.0mm x 1.5mm package.

- Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum rating should be applied at any one time.
- Junction to Ambient thermal resistance is highly dependent on PCB layout. Values are based on thermal properties of the device when soldered to a PCB board.
- “LBYYZ” is the device code, date code and assembly code respectively.
- The device is not guaranteed to function outside of recommended operating condition.

**Function Description**

**Reset Timing**

Reset occurs only after both RST0 and RST1 stay low for  $T_r$  duration, SRO output goes high for  $T_d = 400ms$ , then SRO output goes low.

If RST0 & RST1 stay low indefinitely, KTS1613 only resets one time.

Figure 1. Reset Timing

**Soft Turn ON and OFF**

SRO output has soft turn on and turn off feature in order to reduce VBAT rising and falling overshoot. The output rising and falling time equal to 2ms typical.

nSRO is an open-drain output pin, there is no soft turn on & off feature for nSRO. The timing of SRO and nSRO is shown in Figure 4.
