## VC Low Voltage 125°C

#### **Overview**

KEMET's VC series of low voltage varistors are designed to protect sensitive electronic devices against high voltage surges in the low voltage region. VC varistors offer excellent transient energy absorption due to improved energy volume distribution and power dissipation.

### **Applications**

Typical applications include mobile phones and telecommunication infrastructure, I/O ports and controllers.

The protection of integrated circuits and other components at the circuit board level including the suppression of inductive switching or other transient events such as surge voltage. ESD protection for components sensitive to IEC 1000–4–2, MILSTD 883C Method 3015.7 and other industry specifications. Replacement of larger surface mount TVS Zeners in many applications. Designed to achieve electromagnetic compliance of end products and provide on-board transient voltage protection of ICs and transistors.

#### **Benefits**

- AEC-Q200 qualified Grade 1
- · Surface mount form factor
- Operating ambient temperature of -55°C to +125°C
- Operating voltage range of 11 170 VDC
- Available case sizes: 0603, 0805, 1206, 1210, 1812, 2220
- · Short response time
- Broad range of current and energy handling capabilities
- · Low clamping voltage Uc
- · Non-sensitive to mildly activated fluxes
- Barrier type and terminations solderable with Pb-free solders according to JEDEC J-STD-020C and IEC 60068-2-58
- RoHS Compliant with Exemption 7cl

### Reliability

In general, reliability is the ability of a component to perform and maintain its functions in routine circumstances, as well as hostile or unexpected circumstances. The mean life of series components is a function of:

- Factor of Applied Voltage
- · Ambient temperature

Mean life is closely related to Failure rate (formula).

Mean life (ML) is the arithmetic mean (average) time to failure of a component.

Failure rate is the frequency with which an engineered system or component fails, expressed for example in failures per hour. Failure rate is usually time dependent, an intuitive corollary is that the rate changes over time versus the expected life cycle of a system.

#### Failure rate formula - calculation

$$\Lambda = \frac{10^9}{ML[h]} [fit]$$

#### FAV - Factor of Applied Voltage

$$\Lambda = \frac{Vapl}{V_{max}}$$

Vapl = applied voltage

V<sub>max</sub> = maximum operating voltage

### **Soldering**

Popular soldering techniques used for surface mounted components are Wave and Infrared Reflow processes. Both processes can be performed with Pb-containing or Pb-free solders. The termination option available for these soldering techniques is Barrier Type End Terminations.

| End Termination        | Designation | Recommended and Suitable for | Component RoHS<br>Compliant |  |
|------------------------|-------------|------------------------------|-----------------------------|--|
| Ni Sn Barrier Type End | Ni R1       | Pb-containing and            | RoHS Compliant with         |  |
| Termination            |             | Pb-free soldering            | Exemption 7cl               |  |

**Wave Soldering** – this process is generally associated with discrete components mounted on the underside of printed circuit boards, or for large top-side components with bottom-side mounting tabs to be attached, such as the frames of transformers, relays, connectors, etc. SMD varistors to be wave soldered are first glued to the circuit board, usually with an epoxy adhesive. When all components on the PCB have been positioned and an appropriate time is allowed for adhesive curing, the completed assembly is then placed on a conveyor and run through a single, double wave process.

Infrared Reflow Soldering – these reflow processes are typically associated with top-side component placement. This technique utilizes a mixture of adhesive and solder compounds (and sometimes fluxes) that are blended into a paste. The paste is then screened onto PCB soldering pads specifically designed to accept a particular sized SMD component. The recommended solder paste wet layer thickness is 100 to 300 µm. Once the circuit board is fully populated with MD components, it is placed in a reflow environment, where the paste is heated to slightly above its eutectic temperature. When the solder paste reflows, the SMD components are attached to the solder pads.

**Solder Fluxes** – solder fluxes are generally applied to populated circuit boards to clean oxides forming during the heating process and to facilitate the flowing of the solder. Solder fluxes can be either a part of the solder paste compound or can be separate materials, usually fluids. Recommended fluxes are:

- · Non-activated (R) fluxes, whenever possible
- · Mildly activated (RMA) fluxes of class L3CN
- · Class ORLO

**Activated (RA),** water soluble or strong acidic fluxes with a chlorine content > 0.2 wt. % are NOT RECOMMENDED. The use of such fluxes could create high leakage current paths along the body of the varistor components.

When a flux is applied prior to wave soldering, it is important to completely dry any residual flux solvents prior to the soldering process.

**Thermal Shock** – to avoid the possibility of generating stresses in the varistor chip due to thermal shock, a preheat stage to within 100°C of the peak soldering process temperature is recommended. Additionally, SMD varistors should not be subjected to a temperature gradient greater than 4°C/second, with an ideal gradient being 2°C/second. Peak temperatures should be controlled. Wave and Reflow soldering conditions for SMD varistors with Pb-containing solders are shown in Fig. 1 and 2 respectively, while Wave and Reflow soldering conditions for SMD varistors with Pb-free solders are shown in Figures 1 and 3

#### Soldering cont.

Whenever several different types of SMD components are being soldered, each having a specific soldering profile, the soldering profile with the least heat and the minimum amount of heating time is recommended. Once soldering has been completed, it is necessary to minimize the possibility of thermal shock by allowing the hot PCB to cool to less than 50°C before cleaning.

**Inspection Criteria** – the inspection criteria to determine acceptable solder joints, when Wave or Infrared Reflow processes are used, will depend on several key variables, principally termination material process profiles.

**Pb-contining Wave and IR Reflow Soldering** – typical "before" and "after" soldering results for Barrier Type End Terminations can be seen in Fig. 4. Barrier type terminated varistors form a reliable electrical contact and metallurgical bond between the end terminations and the solder pads. The bond between these two metallic surfaces is exceptionally strong and has been tested by both vertical pull and lateral (horizontal) push tests. The results exceed established industry standards for adhesion.

The solder joint appearance of a barrier type terminated varistor shows that solder forms a metallurgical junction with the thin tin-alloy (over the barrier layer), and due to its small volume "climbs" the outer surface of the terminations, the meniscus will be slightly lower. This optical appearance should be taken into consideration when programming visual inspection of the PCB after soldering.

#### **Ni Sn Barrier Type End Terminations**

Figure 4: Soldering Criterion in case of Wave and IR Reflow Pb-containing Soldering

**Pb-free Wave and IR Reflow Soldering** – typical "before" and "after" soldering results for Barrier Type End Terminations are given in a phenomenon knows as "mirror" or "negative" meniscus. Solder forms a metallurgical junction with the entire volume of the end termination, i.e. it diffuses from pad to end termination across the inner side, forming a "mirror" or "negative" meniscus. The height of the solder penetration can be clearly seen on the end termination and is always 30% higher than the chip height.

#### Soldering cont.

**Solder Test and Retained Samples** – reflow soldering test based on J-STD-020D.1 and soldering test by dipping based on IEC 60068-2 for Pb-free solders are preformed on each production lot as shown in the following chart. Test results and accompanying samples are retained for a minimum of two (2) years. The solderability of a specific lot can be checked at any time within this period should a customer require this information.

| Test                                  | Resistance to Flux                               | Solderability   | Static leaching<br>(Simulation of Reflow<br>Soldering)              | Dynamic Leaching<br>(Simulation of Wave<br>Soldering)               |
|---------------------------------------|--|---|---|---|

**Rework Criteria Soldering Iron** – unless absolutely necessary, the use of soldering irons is NOT recommended for reworking varistor chips. If no other means of rework is available, the following criteria must be strictly followed:

• Do not allow the tip of the iron to directly contact the top of the chip

• Do not exceed the following soldering iron specifications:

Output Power: 30 Watts maximum
Temperature of Soldering Iron Tip: 280°C maximum
Soldering Time: 10 Seconds maximum

**Storage Conditions** – SMD varistors should be used within 1 year of shipment from factory to avoid possible soldering problems caused by oxidized terminals. The storage environment should be controlled, with humidity less than 40% and temperature between -25 and 45 °C. Varistor chips should always be stored in their original packaged unit.

# **Soldering Pad Configuration**

| Size | L (mm)   | W (mm)    | h (mm)   | t <sub>max</sub> (mm) | A (mm) | B (mm) | C (mm) | D (mm) |
|------|----------|-----------|----------|-----------------------|--------|--------|--------|--------|
| 0603 | 1.6±0.20 | 0.80±0.10 | 0.5±0.25 | 1.0                   | 1.0    | 1.0    | 0.6    | 2.6    |

## **Terms and Definitions**

| Term  | Symbol                  | Definition  |
|---|-------------------------|---|
| Rated AC<br>Voltage                             | V <sub>rms</sub>        | Maximum continuous sinusoidal AC voltage (< 5% total harmonic distortion) which may be applied to the component under continuous operation conditions at 25°C   |
| Rated DC<br>Voltage                             | $V_{ m dc}$             | Maximum continuous DC voltage (< 5% ripple) which may be applied to the component under continuous operating conditions at 25°C   |
| Supply<br>Voltage                               | V                       | The voltage by which the system is designated and to which certain operating characteristics of the system are referred; $V_{rms} = 1, 1 \times V$  |
| Leakage Current                                 | l <sub>dc</sub>         | The current passing through the varistor at Vdc and at 25°C or at any other specified temperature   |
| Varistor Voltage                                | V <sub>n</sub>          | Voltage across the varistor measured at a given reference current In  |
| Reference Current                               | I,                      | Reference current = 1 mA DC   |
| Clamping Voltage<br>Protection Level            | V <sub>c</sub>          | The peak voltage developed across the varistor under standard atmospheric conditions, when passing an 8/20 µs class current pulse   |
| Class Current                                   | l <sub>c</sub>          | A peak value of current which is 1/10 of the maximum peak current for 100 pulses at two per<br>minute for the 8/20 μs pulse   |
| Voltage<br>Clamping<br>Ratio                    | $V_{\rm c}/V_{\rm app}$ | A figure of merit measure of the varistor clamping effectiveness as defined by the symbols $V_c/V_{app}$ , where $(V_{app} = V_{rms} \text{ or } V_{dc})$   |
| Jump<br>Start<br>Transient                      | $V_{jump}$              | The jump start transient resulting from the temporary application of an overvoltage in excess of the rated battery voltage. The circuit power supply may be subjected to a temporary overvoltage condition due to the voltage regulation failing or it may be deliberately generated when it becomes necessary to boost start the car |
| Rated Single Pulse<br>Transient Energy          | W <sub>max</sub>        | Energy which may be dissipated for a single 10/1,000 μs pulse of a maximum rated current, with rated AC voltage or rated DC voltage also applied, without causing device failure  |
| Load<br>Dump<br>Transient                       | WLD                     | Load Dump is a transient which occurs in an automotive environment. It is an exponentially decaying positive voltage which occurs in the event of a battery disconect while the alternator is still generating charging current with other loads remaining on the alternator circuit at the time of battery disconect                 |
| Rated Peak Single<br>Pulse Transient<br>Current | l <sub>max</sub>        | Maximum peak current which may be applied for a single 8/20 μs pulse, with, rated line voltage also applies, without causing device failure   |
| Rated Transient<br>Average Power<br>Dissipation | Р                       | Maximum average power which may be dissipated due to a group of pulses occurring within a specified isolated time period, without causing device failure at 25°C  |
| Capacitance                                     | С                       | Capacitance between two terminals of the varistor measured at 1 kHz   |
| Response Time                                   | tr                      | The time lag between application of a surge and varistor's "turn-on" conduction action  |
| Varistor Voltage<br>Temperature<br>Coefficient  | TC                      | (V <sub>n</sub> at 85°C - V <sub>n</sub> at 25°C)/(V <sub>n</sub> at 25°C) x 60°C) x 100  |
| Insulation Resistance                           | IR                      | Minimum resistance between shorted terminals and varistor surface   |
| Isolation                                       |                         | The maximum peak voltage which may be applied under continuous operating conditions   |
| Voltage   |                         | between the varistor terminations and any conducting mounting surface   |
| Operating                                       |                         | The range of ambient temperature for which the varistor is designed to operate continuously as  |
| Temperature                                     |                         | defined by the temperature limits of its climatic category  |
| Climatic Category                               | LCT/UCT/DHD             | UCT = Upper Category Temperature – the maximum ambient temperature for which a varistor has been designed to operate continuously, LCT = Lower Category Temperature – the minimum ambient temperature at which a varistor has been designed to operate continuously  DHD = Dump Heat Test Duration                                    |
| Storage Temperature                             |                         | Storage temperature range without voltage applied   |

#### **Disclaimer**

YAGEO Corporation and its affiliates do not recommend the use of commercial or automotive grade products for high reliability applications or manned space flight.

All product specifications, statements, information and data (collectively, the "Information") in this datasheet are subject to change. The customer is responsible for checking and verifying the extent to which the Information contained in this publication is applicable to an order at the time the order is placed. All Information given herein is believed to be accurate and reliable, but it is presented without guarantee, warranty, or responsibility of any kind, expressed or implied.

Statements of suitability for certain applications are based on KEMET Electronics Corporation's ("KEMET") knowledge of typical operating conditions for such applications, but are not intended to constitute – and KEMET specifically disclaims – any warranty concerning suitability for a specific customer application or use. The Information is intended for use only by customers who have the requisite experience and capability to determine the correct products for their application. Any technical advice inferred from this Information or otherwise provided by KEMET with reference to the use of KEMET's products is given gratis, and KEMET assumes no obligation or liability for the advice given or results obtained.

Although KEMET designs and manufactures its products to the most stringent quality and safety standards, given the current state of the art, isolated component failures may still occur. Accordingly, customer applications which require a high degree of reliability or safety should employ suitable designs or other safeguards (such as installation of protective circuitry or redundancies) in order to ensure that the failure of an electrical component does not result in a risk of personal injury or property damage.

Although all product-related warnings, cautions and notes must be observed, the customer should not assume that all safety measures are indicated or that other measures may not be required.

KEMET requires its products to be packaged and shipped on pallets. This is because KEMET's products are specifically designed to be packed onto pallets during shipment. If for any reason, the products are removed from pallets by the shipping party and shipped to the end customer, then additional external protection is required. In this instance, an external box with two carton layers and an upwards orientation sticker must be used by the shipping party, with the empty space filled with filling material, and afterwards sealing the box. If this packing and packaging guideline is not followed by the shipping party, the shipping party, and not KEMET, will be held responsible for any packaging, packing and/or product damages upon delivery of the products to the end customer. KEMET hereby disclaims any liability for damages to the products or otherwise that have been, or threaten to be, inflicted, result from or are in any way related to the packaging, packing or damage by the shipping party in contravention of the packing and packaging guidelines herein.
