

Doodle Labs Smart Radio - RM-5800

Advanced MIMO Mesh Router in a tiny Form Factor

Smart Radio Overview

The Smart Radio is an advanced 2x2 MIMO mesh router designed for easy plug & play integration. The tiny module carries all bi-directional communication (e.g. Telemetry, Video) in a single high-speed broadband RF channel.

Due to its very low SWaP-C (Space, Weight and Power, Cost), the Smart Radio is very popular for mobile IIoT (Industrial Internet of Things) applications like drones and autonomous vehicles across various industries.

The Smart Radio employs Doodle Labs' patented Mesh Rider® technology with state-of-the-art RF and networking capabilities that enable communication further, faster, and more reliably than any comparable solution on the market. For example, the Ultra Reliable Low Latency Channel (URLLC) transports important command and control data over the wireless link, while a concurrent video-optimized streaming channel carries crystal clear 4K video.

The Smart Radio is available in many frequency bands between 100 MHz and 6 GHz in form-factor compatible models. This allows customers to switch the operating band by simply swapping radio module, avoiding costly re-design efforts when expanding to new markets that require new frequencies. The Smart Radio is available in Embedded, External and Pocketable form factors.

Band Introduction - 5725~5875 MHz ISM Band

The 5.8 GHz ISM Band ranges from 5725~5875 MHz. Due to it's globally unlicensed nature, the 5.8 GHz ISM band is popular for establishing wireless data links for Industrial IoT use cases. The major functions of systems operating in this band are point-to-point communications, video surveillance, control of robotic systems and unmanned aerial vehicles data links supporting exchange of sensor data.

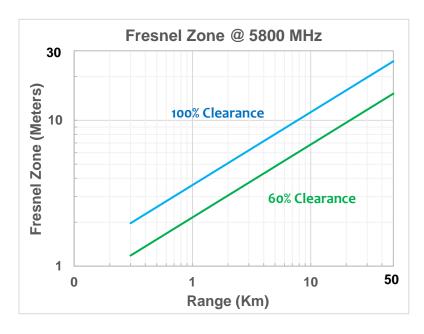

System Integration

The Smart Radio has been designed to be nearly plug and play. Only Ethernet/USB, power supply, and antenna connections are required for integration.

Visit <u>Doodle Labs Technical Library</u> for extensive design-in documents.

Fresnel Zone Clearance

RF Line of Sight (LOS) is defined by <u>Fresnel Zones</u> which are ellipse shaped areas between any two radios. The radius of the *Fresnel Zone* at its widest point is shown the figure.

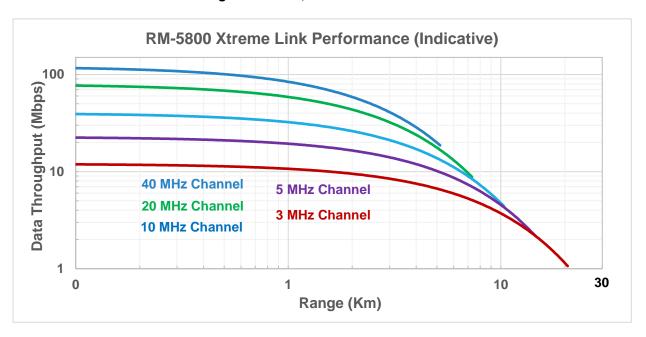

The primary Fresnel zone is required to be at least 60% clear of any obstruction to ensure the highest performance of wireless link.

Link Distance

Smart Radio's Mesh Rider waveform has been field tested for >100km. The link distance depends on many factors, mainly Antenna gain, Line of Sight obstructions, Fresnel Zone clearance and environmental noise conditions. The charts below give an indication of radio's performance in a typical configuration. Refer to the App Note – Optimizing the Link Distance for more details.

Remote Antenna = 6 dBi, Control Station Antenna = 12 dBi, Fade Margin = 10 dBm, Fresnel Zone 60% Clearance
