LMV82x, LMV82xA

Low power, high accuracy, general-purpose operational amplifier

Datasheet — production data

Features

- Low power consumption: 400 µA max at 5 V
- Low power shutdown mode: 50 nA max
- Low offset voltage: 0.8 mV max at 25°C
- Tiny packages
- Extended temperature range: -40°C to +125°C
- Low supply voltage: 2.5 V - 5.5 V
- Gain bandwidth product: 5.5 MHz
- Automotive qualification

Benefits

- Longer lifetime in battery-powered applications
- Higher accuracy without calibration
- Smaller form factor than equivalent competitor devices
- Application performances guaranteed over wide temperature range

Related products

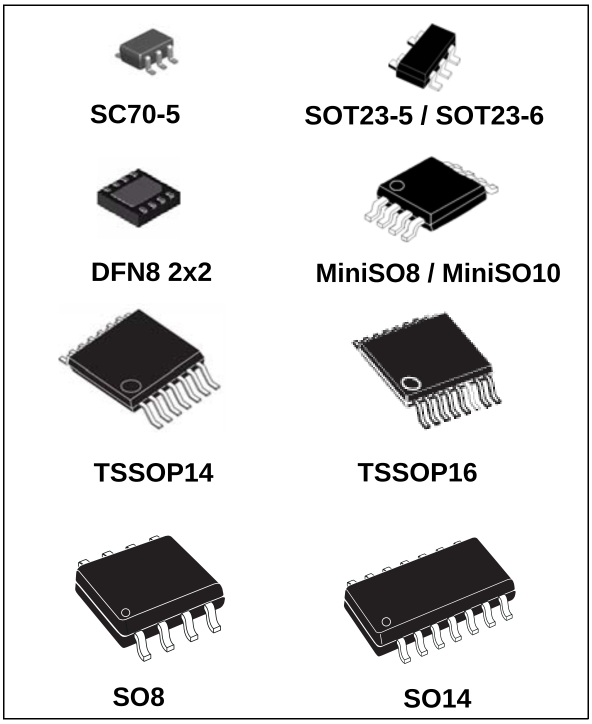
- See TSV85x series for lower power consumption (180 µA max at 5 V)

Applications

- Battery-powered applications
- Portable devices
- Automotive signal conditioning
- Active filtering
- Medical instrumentation

Description

The LMV82x and LMV82xA series of single, dual, and quad operational amplifiers offer low voltage operation with rail-to-rail output swing. They outperform the industry standard LMV321, especially with regard to the gain bandwidth product (5.5 MHz). The LMV821, LMV822 and LMV824 are offered with standard pinouts.



The LMV820, LMV823, and LMV825 include a power-saving shutdown feature that reduces the supply current to a maximum of 50 nA at 25 °C.

The wide temperature range, high ESD tolerance, and automotive grade qualification make them particularly suitable for use in harsh automotive applications.

1. All voltage values, except the differential voltage are with respect to the network ground terminal.
2. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
3. V_{cc}-V_{in} must not exceed 6 V, V_{in} must not exceed 6 V.
4. The input current must be limited by a resistor in series with the inputs.
5. V_{cc}-V_{shdn} must not exceed 6 V, V_{in} must not exceed 6 V.
6. Short-circuits can cause excessive heating and destructive dissipation.
7. R_{th} are typical values.
8. Human body model: a 100 pF capacitor is discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of pin combinations while other pins are floating.
9. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of pin combinations while other pins are floating.
10. Charged device model: all pins and package are charged together to the specified voltage and then discharged directly to ground.

4 Application information

4.1 Operating voltages

The LMV82x and LMV82xA can operate from 2.5 to 5.5 V. The devices' parameters are fully specified for 2.5, 2.7, and 5 V power supplies. Additionally, the main specifications are guaranteed at extended temperature ranges from -40° C to +125° C.

4.2 Input common mode range

The LMV82x and LMV82xA devices have an input common mode range that includes ground. The input common mode range is extended from V_{CC-} - 0.2 V to V_{CC+} - 1 V, with no output phase reversal.

4.3 Rail-to-rail output

The operational amplifiers' output levels can go close to the rails: 150 mV maximum above and below the rail when connected to a 2 kΩ resistive load to $V_{cc}/2$.

4.4 Input offset voltage drift over temperature

The maximum input voltage drift over temperature variation is defined in *Equation 1*.

Equation 1

$$\frac{\Delta Vio}{\Delta T} = \max\left|\frac{Vio(T) - Vio(25°C)}{T - 25°C}\right|$$

for $T_{min} < T < T_{max}$.

4.5 PCB layouts

For correct operation, it is advised to add 10 nF decoupling capacitors as close as possible to the power supply pins.

4.6 Macromodel

Accurate macromodels of the LMV82x and LMV82xA are available on STMicroelectronics' web site at www.st.com. These models are a trade-off between accuracy and complexity (that is, time simulation) of the LMV82x and LMV82xA operational amplifiers. They emulate the nominal performances of a typical device within the specified operating conditions mentioned in the datasheet. They also help to validate a design approach and to select the right operational amplifier, *but they do not replace on-board measurements*.

4.7 Shutdown function

The operational amplifier is enabled when the $\overline{SHDN}$ pin is pulled high. To disable the amplifier, the $\overline{SHDN}$ pin must be pulled down to V_{CC-}. When in shutdown mode, the amplifier output is in a high impedance state. The $\overline{SHDN}$ pin must never be left floating but tied to V_{CC+} or V_{CC-}.

The turn-on and turn-off times are calculated for an output variation of ±200 mV. *Figure 21* and *Figure 22* show the test configurations. *Figure 23* and *Figure 24* show the respective results with these test configurations.

7 Revision history

Table 23. Document revision history

Date	Revision	Changes
10-Nov-2011	1	Initial release.
06-Jul-2012	2	Addition of automotive grade parts.
29-Jan-2013	3	*Description* and *Section 4.6: Macromodel*: small text changes. Updated *Figure 1*. Updated titles of *Figure 3*, *Figure 13*, and *Figure 27*. Updated *Table 10*, *Table 11*, *Table 12*, and *Table 22: Order codes* (automotive grade parts). *Section 4.7: Shutdown function*: added explanation of *Figure 23* and *Figure 24*.
10-Apr-2017	4	Updated *Table 13*: “L” dimension changed from 0.5 mm to 0.425 mm. Minor text revisions throughout the document,
