

# SLG59M1649V

## An Ultra-small, Low-power 23 mΩ, 4 A, P-Channel Load Switch with Reverse-Current Blocking

### General Description

The SLG59M1649V is a self-powered, high-performance, 23 mΩ pFET load switch designed for 1.5 V to 5.5 V power rail applications up to 4 A. When enabled, internal reverse-current protection will quickly open the switch in the event of a reverse-voltage condition is detected

(a  $V_{OUT} + 50 \text{ mV} > V_{IN}$  condition opens the switch). Upon the detection of a reverse condition, an open-drain FAULT output is asserted. In the event the  $V_{IN}$  voltage is too low, the load switch also contains an internal  $V_{IN(UVLO)}$  threshold monitor to keep or to turn the switch OFF.

Designed to operate over a  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  range, the SLG59M1649V is available in a RoHS-compliant, ultra-small 1.0 x 1.6 mm STDFN package.

### Pin Configuration

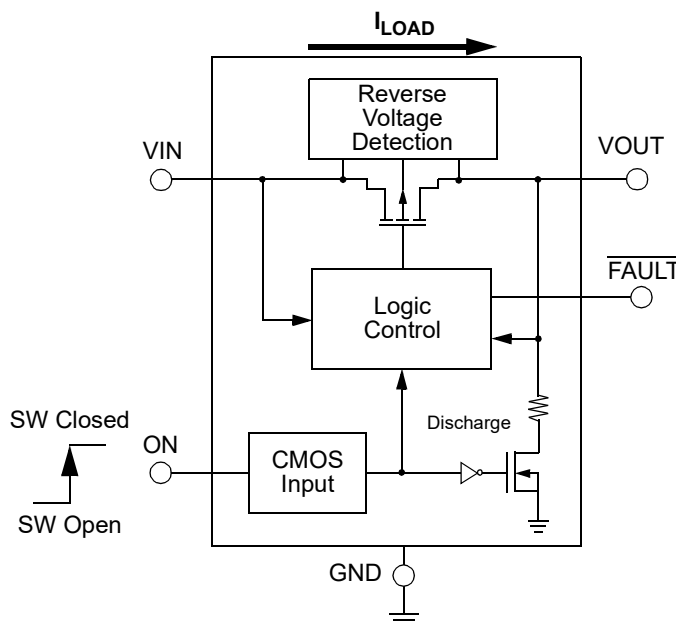

### Features

- Steady-state Operating Current: Up to 4 A
- Low Typical  $R_{DS(ON)}$ :
  - 23 mΩ at  $V_{IN} = 5 \text{ V}$
  - 31 mΩ at  $V_{IN} = 2.5 \text{ V}$
  - 42 mΩ at  $V_{IN} = 1.5 \text{ V}$
- Operating Voltage: 1.5 V to 5.5 V
- Reverse-voltage Detection when ON or OFF
- Internal Gate Driver and  $V_{OUT}$  Discharge
- Open-drain FAULT Signaling
- Operating temperature range:  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Low  $\theta_{JA}$ , 8-pin 1.0 mm x 1.6 mm STDFN Packaging
  - Pb-Free / Halogen-Free / RoHS compliant packaging

### Applications

- Power-Rail Switching:
  - Notebook/Laptop/Tablet PCs
  - Smartphones/Wireless Handsets
  - High-definition Digital Cameras
  - Set-top Boxes
- Point of Sales Pins
- GPS Navigation Devices

### Block Diagram

## SLG59M1649V

An Ultra-small, Low-power 23 mΩ, 4 A,  
P-Channel Load Switch with Reverse-Current Blocking

### Pin Description

Pin #	Pin Name	Type	Pin Description
1, 4	VIN	Power/Input	With an internal 1.4 V $V_{IN(UVLO)}$ threshold, VIN supplies the power for the operation of the load switch, the internal control circuitry, and the source terminal of pFET. Bypass the VIN pin to GND with a 2.2 μF (or larger), low-ESR capacitor.
2, 3	ON	Input	A low-to-high transition on this pin initiates the operation of the load switch. ON is an asserted-HIGH, level-sensitive CMOS input with $ON_{V_{IL}} < 0.3 V$ and $ON_{V_{IH}} > 1 V$ . As the ON input circuitry does not have an internal pull-down resistor, connect the ON pin directly to a GPIO controller – do not allow this pin to be open circuited.
5, 8	VOUT	Output	Output and drain terminal of MOSFET.
6	$\overline{FAULT}$	Output	An open drain output, $\overline{FAULT}$ is asserted within $T_{\overline{FAULT}_{LOW}}$ when a $(V_{OUT} + V_{REVERSE} > V_{IN})$ condition is detected. The $\overline{FAULT}$ output is deasserted within $T_{\overline{FAULT}_{HIGH}}$ when the fault condition is removed. Connect an external 10 kΩ resistor from the $\overline{FAULT}$ pin to the system's local logic supply.
7	GND	GND	Ground connection. Connect this pin to system analog or power ground plane.

### Ordering Information

### Absolute Maximum Ratings

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IN}$	Load Switch Input Voltage		-0.3	--	6	V
$T_S$	Storage Temperature		-65	--	150	°C
ESD <sub>HBM</sub>	ESD Protection	Human Body Model	2000	--	--	V
ESD <sub>CDM</sub>	ESD Protection	Charged Device Model	1000	--	--	V
MSL	Moisture Sensitivity Level		1			
$\theta_{JA}$	Thermal Resistance	1.0 x 1.6 mm 8L STDFN	--	82	--	°C/W
$T_{J,MAX}$	Maximum Junction Temperature		--	150	--	°C
MOSFET IDS <sub>CONT</sub>	Continuous Current from VIN to VOUT	Each channel, $T_J < 150^\circ\text{C}$	--	--	4	A
MOSFET IDS <sub>PK</sub>	Peak Current from VIN to VOUT	Maximum pulsed switch current, pulse width < 1 ms, 1% duty cycle	--	--	4.5	A

Note: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### Electrical Characteristics

$1.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ ;  $C_{IN} = 2.2\ \mu\text{F}$ ;  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$  unless otherwise noted. Typical values are at  $T_A = 25^\circ\text{C}$ .

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IN}$	Load Switch Input Voltage		1.5	--	5.5	V
$V_{IN(UVLO)}$	$V_{IN}$ Undervoltage Lockout Threshold	$V_{IN} \uparrow$ , $V_{ON} = 0\text{ V}$ , $R_{LOAD} = 10\ \Omega$	--	--	1.4	V

## SLG59M1649V

### An Ultra-small, Low-power 23 mΩ, 4 A, P-Channel Load Switch with Reverse-Current Blocking

#### V<sub>IN</sub> Inrush Current Details

When the SLG59M1649V is enabled with ON ↑, the load switch closes to charge the V<sub>OUT</sub> output capacitor to V<sub>IN</sub>. The charging current drawn from V<sub>IN</sub> is commonly referred to as “V<sub>IN</sub> inrush current” and can cause the input power source to collapse if the V<sub>IN</sub> inrush current is too high.

Since the V<sub>OUT</sub> rise time of the SLG59M1649V is fixed, V<sub>IN</sub> inrush current is then a function of the output capacitance at V<sub>OUT</sub>. The expression relating V<sub>IN</sub> inrush current, the SLG59M1649V V<sub>OUT</sub> rise time, and C<sub>LOAD</sub> is:

$$V_{IN} \text{ Inrush Current} = C_{LOAD} \times \frac{\Delta V_{OUT}(10\% \text{ to } 90\%)}{T_{VOUT(R)}(10\% \text{ to } 90\%)}$$

where in this expression ΔV<sub>OUT</sub> is equivalent to V<sub>IN</sub> if the initial SLG59M1649V's output voltages are zero.

In the table below are examples of V<sub>IN</sub> inrush currents assuming zero initial charge on C<sub>LOAD</sub> as a function of V<sub>IN</sub>.

V <sub>IN</sub> (V)	V <sub>OUT</sub> Rise Time (μs)	C <sub>LOAD</sub> (μF)	Inrush Current (mA)
1.5	66	0.1	1.8
5	130	0.1	3.1

Since the relationship is linear and if C<sub>LOAD</sub> were increased to 1 μF, then the V<sub>IN</sub> inrush currents would be 10x higher in either example. If a large C<sub>LOAD</sub> capacitor is required in the application and depending upon the strength of the input power source, it may very well be necessary to increase the C<sub>IN</sub>-to-C<sub>LOAD</sub> ratio to minimize V<sub>IN</sub> droop during turn-on.

For other V<sub>OUT</sub> rise time options, please contact Renesas for additional information.

#### Power Dissipation

The junction temperature of the SLG59M1649V depends on factors such as board layout, ambient temperature, external air flow over the package, load current, and the RDS<sub>ON</sub>-generated voltage drop across each power MOSFET. While the primary contributor to the increase in the junction temperature of the SLG59M1649V is the power dissipation of its power MOSFETs, its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$PD_{TOTAL} = RDS_{ON} \times I_{DS}^2$$

where:

PD<sub>TOTAL</sub> = Total package power dissipation, in Watts (W)

RDS<sub>ON</sub> = Power MOSFET ON resistance, in Ohms (Ω)

I<sub>DS</sub> = Output current, in Amps (A)

and

$$T_J = PD_{TOTAL} \times \theta_{JA} + T_A$$

where:

T<sub>J</sub> = Die junction temperature, in Celsius degrees (°C)

θ<sub>JA</sub> = Package thermal resistance, in Celsius degrees per Watt (°C/W) – highly dependent on pcb layout

T<sub>A</sub> = Ambient temperature, in Celsius degrees (°C)

## SLG59M1649V

An Ultra-small, Low-power 23 mΩ, 4 A,  
P-Channel Load Switch with Reverse-Current Blocking

### Power Dissipation (continued)

In nominal operating mode, the SLG59M1649V's power dissipation can also be calculated by taking into account the voltage drop across each switch ( $V_{IN}-V_{OUT}$ ) and the magnitude of that channel's output current ( $I_{DS}$ ):

$$PD_{TOTAL} = (V_{IN}-V_{OUT}) \times I_{DS} \text{ or}$$

$$PD_{TOTAL} = (V_{IN} - (R_{LOAD} \times I_{DS})) \times I_{DS}$$

where:

$PD_{TOTAL}$  = Total package power dissipation, in Watts (W)

$V_{IN}$  = Input Voltage, in Volts (V)

$R_{LOAD}$  = Output Load Resistance, in Ohms ( $\Omega$ )

$I_{DS}$  = Output current, in Amps (A)

$V_{OUT}$  = Output voltage, or  $R_{LOAD} \times I_{DS}$

### Power Dissipation Derating Curve

## SLG59M1649V

An Ultra-small, Low-power 23 m $\Omega$ , 4 A, P-Channel Load Switch with Reverse-Current Blocking

### Layout Guidelines:

1. Since the VIN and VOUT pins dissipate most of the heat generated during high-load current operation, it is highly recommended to make power traces as short, direct, and wide as possible. A good practice is to make power traces with absolute minimum widths of 15 mils (0.381 mm) per Ampere. A representative layout, shown in Figure 1, illustrates proper techniques for heat to transfer as efficiently as possible out of the device;
2. To minimize the effects of parasitic trace inductance on normal operation, it is recommended to connect input C<sub>IN</sub> and output C<sub>LOAD</sub> low-ESR capacitors as close as possible to the SLG59M1649V's VIN and VOUT pins;
3. The GND pin should be connected to system analog or power ground plane.
4. 2 oz. copper is recommended for high current operation.

### SLG59M1649V Evaluation Board:

A GreenFET Evaluation Board for SLG59M1649V is designed according to the statements above and is illustrated on Figure 1. Please note that evaluation board has D\_Sense and S\_Sense pads. They cannot carry high currents and dedicated only for RDS<sub>ON</sub> evaluation.

Please solder your SLG59M1649V here

### Basic Test Setup and Connections

Figure 3. Typical connections for GreenFET Evaluation.

#### EVB Configuration

1. Connect oscilloscope probes to D1/VIN, D2, S1/VO1, S2/VO2, ON etc.;
2. Use VDD connector to have logic high level for FAULT and ON signals;
3. Turn on Power Supply 1 and set desired  $V_{IN}$  from 1.5 V...5.5 V range;
4. Toggle the ON signal High or Low to observe SLG59M1649V operation.
