

SN75374 QUADRUPLE MOSFET DRIVER

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

- Quadruple Circuits Capable of Driving High-Capacitance Loads at High Speeds
- Output Supply Voltage Range From 5 V to 24 V
- Low Standby Power Dissipation
- V_{CC3} Supply Maximizes Output Source Voltage

description/ordering information

The SN75374 is a quadruple NAND interface circuit designed to drive power MOSFETs from TTL inputs. It provides the high current and voltage necessary to drive large capacitive loads at high speeds.

The outputs can be switched very close to the V_{CC2} supply rail when V_{CC3} is about 3 V higher than V_{CC2} . V_{CC3} also can be tied directly to V_{CC2} when the source voltage requirements are lower.

ORDERING INFORMATION

T_A	PACKAGE†		ORDERABLE PART NUMBER	TOP-SIDE MARKING
0°C to 70°C	PDIP (N)	Tube of 25	SN75374N	SN75374N
	SOIC (D)	Tube of 40	SN75374D	SN75374
		Reel of 2500	SN75374DR	

† Package drawings, standard packing quantities, thermal data, symbolization, and PCB design guidelines are available at www.ti.com/sc/package.

SN75374 QUADRUPLE MOSFET DRIVER

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

schematic (each driver)

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range (see Note 1):	V_{CC1}	-0.5 V to 7 V
	V_{CC2}	-0.5 V to 25 V
	V_{CC3}	-0.5 V to 30 V
Input voltage, V_I		5.5 V
Peak output current, I_O ($t_W < 10$ ms, duty cycle $< 50\%$)		500 mA
Package thermal impedance, θ_{JA} (see Notes 2 and 3):	D package	73°C/W
	N package	67°C/W
Operating virtual junction temperature, T_J		150°C
Storage temperature range, T_{stg}		-65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES:
1. Voltage values are with respect to network ground terminal.
 2. Maximum power dissipation is a function of $T_J(\max)$, θ_{JA} , and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(\max) - T_A)/\theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.
 3. The package thermal impedance is calculated in accordance with JESD 51-7.

recommended operating conditions

		MIN	NOM	MAX	UNIT

SN75374 QUADRUPLE MOSFET DRIVER

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

THERMAL INFORMATION

power-dissipation precautions

Significant power may be dissipated in the SN75374 driver when charging and discharging high-capacitance loads over a wide voltage range at high frequencies. Figure 12 shows the power dissipated in a typical SN75374 as a function of frequency and load capacitance. Average power dissipated by this driver is derived from the equation:

$$P_{T(AV)} = P_{DC(AV)} + P_{C(AV)} + P_{S(AV)}$$

where $P_{DC(AV)}$ is the steady-state power dissipation with the output high or low, $P_{C(AV)}$ is the power level during charging or discharging of the load capacitance, and $P_{S(AV)}$ is the power dissipation during switching between the low and high levels. None of these include energy transferred to the load, and all are averaged over a full cycle.

The power components per driver channel are:

$$P_{DC(AV)} = \frac{(P_H t_H + P_L t_L)}{T}$$

$$P_{C(AV)} \approx CV^2 f$$

$$P_{S(AV)} = \frac{(P_{LH} t_{LH} + P_{HL} t_{HL})}{T}$$

where the times are as defined in Figure 15.

Figure 13. Output-Voltage Waveform

THERMAL INFORMATION

power-dissipation precautions (continued)

P_L , P_H , P_{LH} , and P_{HL} are the respective instantaneous levels of power dissipation, and C is the load capacitance. V_C is the voltage across the load capacitance during the charge cycle shown by the equation:

$$V_C = V_{OH} - V_{OL}$$

$P_{S(AV)}$ may be ignored for power calculations at low frequencies.

In the following power calculation, all four channels are operating under identical conditions: $f = 0.2$ MHz, $V_{OH} = 19.9$ V and $V_{OL} = 0.15$ V with $V_{CC1} = 5$ V, $V_{CC2} = 20$ V, $V_{CC3} = 24$ V, $V_C = 19.75$ V, $C = 1000$ pF, and the duty cycle = 60%. At 0.2 MHz for $C_L < 2000$ pF, $P_{S(AV)}$ is negligible and can be ignored. When the output voltage is low, I_{CC2} is negligible and can be ignored.

On a per-channel basis using data-sheet values,

$$P_{DC(AV)} = \left[5 \text{ V} \left(\frac{4 \text{ mA}}{4} \right) + 20 \text{ V} \left(\frac{-2.2 \text{ mA}}{4} \right) + 24 \text{ V} \left(\frac{2.2 \text{ mA}}{4} \right) \right] 0.6 +$$

$$\left[5 \text{ V} \left(\frac{31 \text{ mA}}{4} \right) + 20 \text{ V} \left(\frac{0 \text{ mA}}{4} \right) + 24 \text{ V} \left(\frac{16 \text{ mA}}{4} \right) \right] 0.4$$

$$P_{DC(AV)} = 58.2 \text{ mW per channel}$$

Power during the charging time of the load capacitance is

$$P_{C(AV)} = (1000 \text{ pF})(19.75 \text{ V})^2(0.2 \text{ MHz}) = 78 \text{ mW per channel}$$

Total power for each driver is:

$$P_{T(AV)} = 58.2 \text{ mW} + 78 \text{ mW} = 136.2 \text{ mW}$$

The total package power is:

$$P_{T(AV)} = (136.2)(4) = 544.8 \text{ mW}$$

SN75374 QUADRUPLE MOSFET DRIVER

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

APPLICATION INFORMATION

driving power MOSFETs

The drive requirements of power MOSFETs are much lower than comparable bipolar power transistors. The input impedance of an FET consists of a reverse-biased PN junction that can be described as a large capacitance in parallel with a very high resistance. For this reason, the commonly used open-collector driver with a pullup resistor is not satisfactory for high-speed applications. In Figure 14a, an IRF151 power MOSFET switching an inductive load is driven by an open-collector transistor driver with a 470-Ω pullup resistor. The input capacitance (C_{ISS}) specification for an IRF151 is 4000 pF maximum. The resulting long turn-on time, due to the product of input capacitance and the pullup resistor, is shown in Figure 14b.

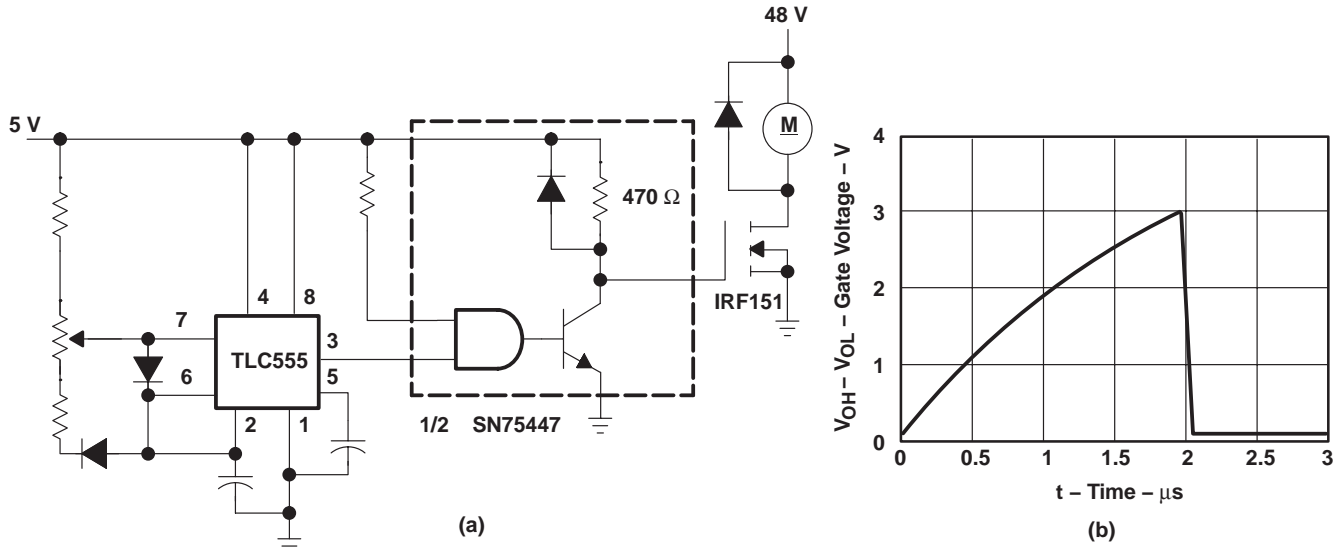

Figure 14. Power MOSFET Drive Using SN75447

A faster, more efficient drive circuit uses an active pullup, as well as an active pulldown output configuration, referred to as a totem-pole output. The SN75374 driver provides the high-speed totem-pole drive desired in an application of this type (see Figure 15a). The resulting faster switching speeds are shown in Figure 15b.

Figure 15. Power MOSFET Drive Using SN75374

APPLICATION INFORMATION

driving power MOSFETs (continued)

Power MOSFET drivers must be capable of supplying high peak currents to achieve fast switching speeds as shown by the equation:

$$I_{PK} = \frac{VC}{t_r}$$

where C is the capacitive load and t_r is the desired rise time. V is the voltage that the capacitance is charged to. In the circuit shown in Figure 14a, V is found by the equation:

$$V = V_{OH} - V_{OL}$$

Peak current required to maintain a rise time of 100 ns in the circuit of Figure 14a is:

$$I_{PK} = \frac{(3 - 0)4(10^{-9})}{100(10^{-9})} = 120 \text{ mA}$$

Circuit capacitance can be ignored because it is very small compared to the input capacitance of the IRF151. With a V_{CC} of 5 V and assuming worst-case conditions, the gate drive voltage is 3 V.

For applications in which the full voltage of V_{CC2} must be supplied to the MOSFET gate, V_{CC3} should be at least 3 V higher than V_{CC2} .

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
