CDCE(L)913: Flexible Low Power LVCMOS Clock Generator With SSC Support for EMI Reduction

1 Features

- Member of Programmable Clock Generator Family
  - CDCEx913: 1 PLLs, 3 Outputs
  - CDCEx925: 2 PLLs, 5 Outputs
  - CDCEx937: 3 PLLs, 7 Outputs
  - *CDCEx949: 4 PLLs, 9 Outputs*
- In-System Programmability and EEPROM
  - Serial Programmable Volatile Register
  - Nonvolatile EEPROM to Store Customer Settings
- Flexible Input Clocking Concept
  - External Crystal: 8 to 32 MHz
  - On-Chip VCXO: Pull-Range ±150 ppm
  - Single-Ended LVCMOS Up to 160 MHz
- Free Selectable Output Frequency Up to 230 MHz
- Low-Noise PLL Core
  - PLL Loop Filter Components Integrated
  - Low Period Jitter (Typical 60 ps)
- Separate Output Supply Pins
  - CDCE949: 3.3 V and 2.5 V
  - CDCEL949: 1.8 V
- Flexible Clock Driver
  - Three User-Definable Control Inputs [S0/S1/S2], for Example, SSC Selection, Frequency Switching, Output Enable or Power Down
  - Generates Highly Accurate Clocks for Video, Audio, USB, IEEE1394, RFID, Bluetooth®, WLAN, Ethernet™, and GPS
  - Generates Common Clock Frequencies Used With TI-DaVinci™, OMAP™, DSPs
  - Programmable SSC Modulation
  - Enables 0-PPM Clock Generation
- 1.8-V Device Core Supply
- Wide Temperature Range: –40°C to 85°C
- Packaged in TSSOP
- Development and Programming Kit for Easy PLL Design and Programming (TI Pro-Clock™)

2 Applications

D-TVs, STBs, IP-STBs, DVD Players, DVD Recorders, and Printers

3 Description

The CDCE949 and CDCEL949 are modular PLL-based low cost, high-performance, programmable clock synthesizers, multipliers and dividers. They generate up to 9 output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using up to four independent configurable PLLs.

The CDCEx949 has separate output supply pins, V_{DDOUT}, 1.8 V for the CDCEL949, and 2.5 V to 3.3 V for CDCE949.

The input accepts an external crystal or LVCMOS clock signal. If an external crystal is used, an on-chip load capacitor is adequate for most applications. The value of the load capacitor is programmable from 0 to 20 pF. Additionally, an on-chip VCXO is selectable, allowing synchronization of the output frequency to an external control signal, that is, a PWM signal.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
CDCE949 CDCEL949	TSSOP (24)	7.80 mm × 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application Schematic

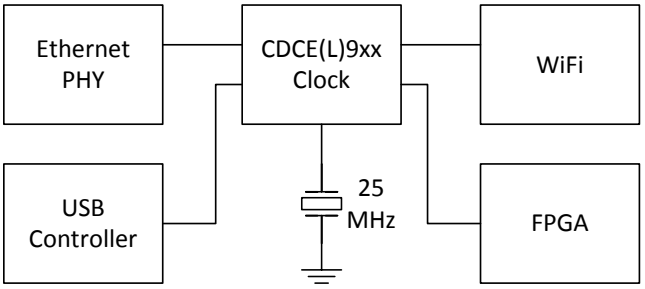

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (August 2016) to Revision F — **Page**

- Changed data sheet title from: *CDCEx949 Programmable 4-PLL VCXO Clock Synthesizer With 1.8-V, 2.5-V, and 3.3-V LVCMOS Outputs* to: *CDCE(L)913: Flexible Low Power LVCMOS Clock Generator With SSC Support for EMI Reduction* ... 1

Changes from Revision D (March 2010) to Revision E — **Page**

- Added *Device Information* table, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ... 1
- Condensed down bullets in *Features* ... 1
- Deleted 'General Purpose Frequency Synthesizing' from *Applications* ... 1
- Updated values in the *Thermal Information* table to align with JEDEC standards ... 6
- Changed Byte Read Protocol image, second S to Sr ... 18
- Changed 100 MHz < f_{VCO} > 200 MHz; TO 80 MHz ≤ f_{VCO} ≤ 230 MHz; and changed 0 ≤ p ≤ 7 TO 0 ≤ p ≤ 4 ... 29
- Changed under Example, fifth row, N'', 2 places TO N' ... 29

Changes from Revision C (October 2009) to Revision D — **Page**

- Added PLL settings limits: 16 ≤ q ≤ 63, 0 ≤ p ≤ 7, 0 ≤ r ≤ 511, 0 < N < 4096 foot to PLL1, PLL2, PLL3, & PLL4 Configure Register Table ... 22

Changes from Revision B (September 2009) to Revision C **Page**

- Deleted sentence - A different default setting can be programmed on customer request. Contact Texas Instruments sales or marketing representative for more information. 15

Changes from Revision A (December 2007) to Revision B **Page**

- Added Note 3: SDA and SCL can go up to 3.6 V as stated in the *Recommended Operating Conditions* table 6

Changes from Original (August 2007) to Revision A **Page**

- Changed the THERMAL RESISTANCE FOR TSSOP table 6
- Changed *Generic Configuration Register* table RID From: 0h To: Xb 19
- Added note to the PWDN description, *Generic Configuration Register* table 19

5 Description (continued)

The deep M/N divider ratio allows the generation of zero-ppm audio or video, networking (WLAN, BlueTooth™, Ethernet, GPS) or Interface (USB, IEEE1394, Memory Stick) clocks from a reference input frequency, such as 27 MHz.

All PLLs support SSC (Spread-Spectrum Clocking). SSC can be Center-Spread or Down-Spread clocking. This is a common technique to reduce electro-magnetic interference (EMI).

Based on the PLL frequency and the divider settings, the internal loop-filter components are automatically adjusted to achieve high stability, and to optimize the jitter-transfer characteristics of each PLL.

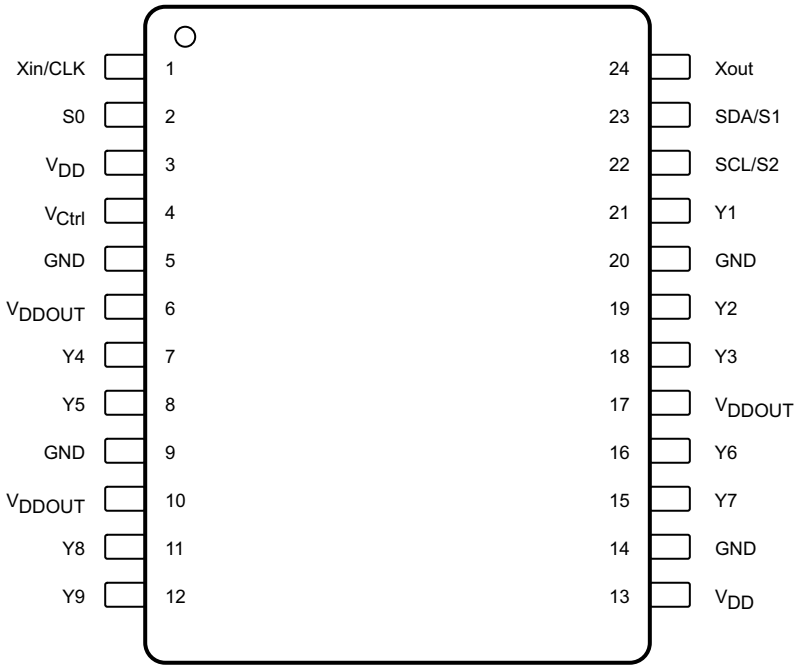
The device supports non-volatile EEPROM programming for easy customization of the device to the application. It is preset to a factory-default configuration. It can be reprogrammed to a different application configuration before PCB assembly, or reprogrammed by in-system programming. All device settings are programmable through the SDA and SCL bus, a 2-wire serial interface.

Three programmable control inputs, S0, S1 and S2, can be used to control various aspects of operation including frequency selection, changing the SSC parameters to lower EMI, PLL bypass, power down, and choosing between low level or 3-state for the output-disable function.

The CDCEx949 operates in a 1.8-V environment. It operates within a temperature range of –40°C to 85°C.

6 Pin Configuration and Functions

PW Package
24-Pin TSSOP
(Top View)



Not to scale

Pin Functions

PIN		TYPE(1)	DESCRIPTION
NAME	NO.		
GND	5, 9, 14, 20	G	Ground
SCL/S2	22	I	**SCL:** Serial clock input (default configuration), LVCMOS; internal pullup 500 kΩ; or **S2:** User-programmable control input; LVCMOS inputs; internal pullup 500 kΩ

(1) G = Ground, I = Input, O = Output, P = Power

Pin Functions (continued)

PIN		TYPE[1]	DESCRIPTION
NAME	NO.		
SDA/S1	23	I/O	**SDA:** Bidirectional serial data input/output (default configuration), LVCMOS; internal pullup 500 kΩ; or **S1:** User-programmable control input; LVCMOS inputs; internal pullup 500 kΩ
S0	2	I	User-programmable control input S0; LVCMOS inputs; internal pullup 500 kΩ
V_{Ctrl}	4	I	VCXO control voltage (leave open or pull up when not used)
V_{DD}	3, 13	P	1.8-V power supply for the device
V_{DDOUT}	6, 10, 17	P	**CDCEL949:** 1.8-V supply for all outputs
			CDCE949: 3.3-V or 2.5-V supply for all outputs
Xin/CLK	1	I	Crystal oscillator input or LVCMOS clock input (selectable through SDA/SCL bus)
Xout	24	O	Crystal oscillator output (leave open or pull up when not used)
Y1	21	O	LVCMOS output
Y2	19		
Y3	18		
Y4	7		
Y5	8		
Y6	16		
Y7	15		
Y8	11		
Y9	12		

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
V_{DD}	Supply voltage	–0.5	2.5	V
V_I	Input voltage[2] [3]	–0.5	V_{DD} + 0.5	V
V_O	Output voltage[2]	–0.5	V_{DDOUT} + 0.5	V
I_I	Input current (V_I < 0, V_I > V_{DD})		20	mA
I_O	Continuous output current		50	mA
T_J	Junction temperature		125	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
(2) The input and output negative voltage ratings may be exceeded if the input and output clamp–current ratings are observed.
(3) SDA and SCL can go up to 3.6 V as stated in the *Recommended Operating Conditions* table.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{DD}	Device supply voltage		1.7	1.8	1.9	V
$V_{DD(OUT)}$	Output Yx supply voltage	CDCE949	2.3		3.6	V
		CDCEL949	1.7		1.9	
V_{IL}	Low level input voltage LVCMOS				0.3 × V_{DD}	V
V_{IH}	High level input voltage LVCMOS		0.7 × V_{DD}			V
$V_{I(thresh)}$	Input voltage threshold LVCMOS			0.5 × V_{DD}		V
V_{IS}	Input voltage	S0	0		1.9	V
		S1, S2, SDA, SCL, $V_{Ithresh}$ = 0.5 × V_{DD}	0		3.6	
V_{ICLK}	Input voltage CLK		0		1.9	V
I_{OH} /I_{OL}	Output current	V_{DDout} = 3.3 V			±12	mA
		V_{DDout} = 2.5 V			±10	mA
		V_{DDout} = 1.8 V			±8	mA
C_L	Output load LVCMOS				10	pF
T_A	Operating free-air temperature		–40		85	°C
CRYSTAL AND VCXO(1)						
f_{Xtal}	Crystal Input frequency (fundamental mode)		8	27	32	MHz
ESR	Effective series resistance				100	Ω
f_{PR}	Pulling (0 V ≤ V_{Ctrl} ≤ 1.8 V)(2)		±120	±150		ppm
$V_{(Ctrl)}$	Frequency control voltage		0		V_{DD}	V
C_0/C_1	Pullability ratio				220	
C_L	On-chip load capacitance at Xin and Xout		0		20	pF

(1) For more information about VCXO configuration and crystal recommendation, see *VCXO Application Guideline for CDCE(L)9xx Family* (SCAA085).
(2) Pulling range depends on crystal type, on-chip crystal load capacitance and PCB stray capacitance; pulling range of min ±120 ppm applies for crystal listed in *VCXO Application Guideline for CDCE(L)9xx Family* (SCAA085).

7.4 Thermal Information

THERMAL METRIC(1)			CDCEx949 PW (TSSOP) 24 PINS	UNIT
θ_{JA}	Junction-to-ambient thermal resistance(2)	Airflow 0 (LFM)	91	°C/W
		Airflow 150 (LFM)	75	
		Airflow 200 (LFM)	74	
		Airflow 250 (LFM)	73	
		Airflow 500 (LFM)	65	
θ_{JCtop}	Junction-to-case (top) thermal resistance		0.5	°C/W
θ_{JB}	Junction-to-board thermal resistance		52	°C/W
ψ_{JT}	Junction-to-top characterization parameter		0.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter		50.1	°C/W
θ_{JCbot}	Junction-to-case (bottom) thermal resistance		50	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.
(2) The package thermal impedance is calculated in accordance with JESD 51 and JEDEC2S2P (high-k board).

7.5 Electrical Characteristics

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP(1)	MAX	UNIT
I_{DD}	Supply current (see Figure 1)	All outputs off, f_{CLK} = 27 MHz, f_{VCO}= 135 MHz	All PLLs on		38		mA
			Per PLL		9

			CDCEL949 V_{DDOUT} = 1.8 V		2		
$I_{DD(PD)}$	Power down current	Every circuit powered down except SDA/SCL, f_{IN} = 0 MHz, V_{DD} = 1.9 V			50		µA
$V_{(PUC)}$	Supply voltage V_{DD} threshold for power up control circuit			0.85		1.45	V
f_{VCO}	VCO frequency range of PLL			80		230	MHz
f_{OUT}	LVCMOS output frequency			230			MHz
LVCMOS							
V_{IK}	LVCMOS input voltage	V_{DD} = 1.7 V, I_I = –18 mA				–1.2	V
I_I	LVCMOS input current	V_I = 0 V or V_{DD}, V_{DD} = 1.9 V				±5	µA
I_{IH}	LVCMOS input current for S0/S1/S2	V_I = V_{DD}, V_{DD} = 1.9 V				5	µA
I_{IL}	LVCMOS input current for S0/S1/S2	V_I = 0 V, V_{DD} = 1.9 V				–4	µA
C_I	Input capacitance at Xin/Clk	V_{ICLK} = 0 V or V_{DD}			6		pF
	Input capacitance at Xout	V_{IXout} = 0 V or V_{DD}			2		
	Input capacitance at S0/S1/S2	V_{IS} = 0 V or V_{DD}			3		
CDCE949 – LVCMOS FOR V_{DDOUT} = 3.3 V							
V_{OH}	LVCMOS high-level output voltage	V_{DDOUT} = 3 V, I_{OH} = –0.1 mA		2.9			V
		V_{DDOUT} = 3 V, I_{OH} = –8 mA		2.4			
		V_{DDOUT} = 3 V, I_{OH} = –12 mA		2.2			
V_{OL}	LVCMOS low-level output voltage	V_{DDOUT} = 3 V, I_{OL} = 0.1 mA				0.1	V
		V_{DDOUT} = 3 V, I_{OL} = 8 mA				0.5	
		V_{DDOUT} = 3 V, I_{OL} = 12 mA				0.8	
t_{PLH}, t_{PHL}	Propagation delay	PLL bypass			3.2		ns
t_r/t_f	Rise and fall time	V_{DDOUT} = 3.3 V (20%–80%)			0.6		ns
$t_{jit(cc)}$	Cycle-to-cycle jitter(2)(3)	1 PLL switching, Y2-to-Y3			60	90	ps
		4 PLLs switching, Y2-to-Y9			120	170	
$t_{jit(per)}$	Peak-to-peak period jitter(2)(3)	1 PLL switching, Y2-to-Y3			70	100	ps
		4 PLLs switching, Y2-to-Y9			130	180	
$t_{sk(o)}$	Output skew(4)	f_{OUT} = 50 MHz, Y1-to-Y3				60	ps
		f_{OUT} = 50 MHz, Y2-to-Y5 or Y6-to-Y9				160	
odc	Output duty cycle(5)	f_{VCO} = 100 MHz, Pdiv = 1		45%		55%	
CDCE949 – LVCMOS FOR V_{DDOUT} = 2.5 V							
V_{OH}	LVCMOS high-level output voltage	V_{DDOUT} = 2.3 V, I_{OH} = –0.1 mA		2.2			V
		V_{DDOUT} = 2.3 V, I_{OH} = –6 mA		1.7			
		V_{DDOUT} = 2.3 V, I_{OH} = –10 mA		1.6			

(1) All typical values are at respective nominal V_{DD}.
(2) 10000 cycles.
(3) Jitter depends on device configuration. Data is taken under the following conditions: 1-PLL: f_{IN} = 27 MHz, Y2/3 = 27 MHz, (measured at Y2), 4-PLL: f_{IN} = 27 MHz, Y2/3 = 27 MHz, (manured at Y2), Y4/5 = 16.384 MHz, Y6/7 = 74.25 MHz, Y8/9 = 48 MHz.
(4) The $t_{sk(o)}$ specification is only valid for equal loading of each bank of outputs and outputs are generated from the same divider; data sampled on rising edge (t_r).
(5) odc depends on output rise- and fall-time (t_r/t_f).

9 Detailed Description

9.1 Overview

The CDCE949 and CDCEL949 devices are modular PLL-based, low-cost, high-performance, programmable clock synthesizers, multipliers, and dividers. They generate up to nine output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using one of the four integrated configurable PLLs.

The CDCEx949 has separate output supply pins, V_{DDOUT}, which is 1.8 V for CDCEL949 and 2.5 V to 3.3 V for CDCE949.

The input accepts an external crystal or LVCMOS clock signal. If an external crystal is used, an on-chip load capacitor is adequate for most applications. The value of the load capacitor is programmable from 0 to 20 pF. Additionally, a selectable on-chip VCXO allows synchronization of the output frequency to an external control signal, that is, the PWM signal.

The deep M/N divider ratio allows the generation of 0-ppm audio and video, networking (WLAN, Bluetooth, Ethernet, GPS), or Interface (USB, IEEE1394, memory stick) clocks from a reference input frequency such as 27 MHz.

All PLLs support spread-spectrum clocking (SSC). SSC can be center-spread or down-spread clocking. This is a common technique to reduce electro-magnetic interference (EMI).

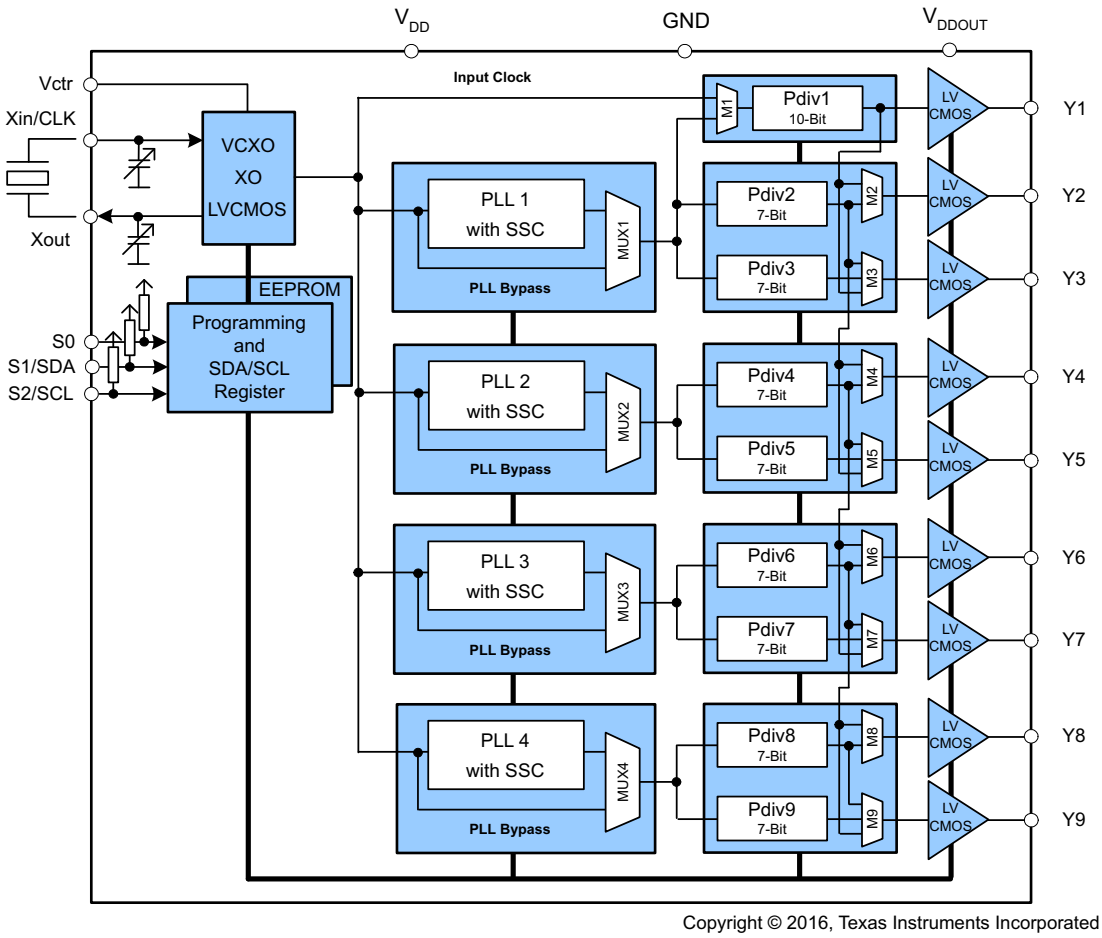
Based on the PLL frequency and the divider settings, the internal loop filter components are automatically adjusted to achieve high stability, and to optimize the jitter-transfer characteristics of each PLL.

The device supports non-volatile EEPROM programming for easy customization of the device to the application. It is preset to a factory-default configuration (see *Default Device Setting*). It can be reprogrammed to a different application configuration before PCB assembly, or reprogrammed by in-system programming. All device settings are programmable through the SDA and SCL bus, a 2-wire serial interface.

Three programmable control inputs, S0, S1 and S2, can be used to control various aspects of operation including frequency selection, changing the SSC parameters to lower EMI, PLL bypass, power down, and choosing between low level or 3-state for the output-disable function.

The CDCEx949 operates in a 1.8-V environment. It operates within a temperature range of –40°C to 85°C.

9.2 Functional Block Diagram



9.3 Feature Description

9.3.1 Control Terminal Setting

The CDCEx949 has three user-definable control terminals (S0, S1, and S2) which allow external control of device settings. They can be programmed to any of the following setting:

- Spread spectrum clocking selection → spread type and spread amount selection
- Frequency selection → switching between any of two user-defined frequencies
- Output state selection → output configuration and power down control

The user can predefine up to eight different control settings. Table 1 and Table 2 explain these settings.

Feature Description (continued)

Table 1. Control Terminal Definition

EXTERNAL CONTROL BITS	PLL1 SETTING			PLL2 SETTING			PLL3 SETTING			PLL4 SETTING			Y1 SETTING
Control Function	PLL Frequency Selection	SSC Selection	Output Y2/Y3 Selection	PLL Frequency Selection	SSC Selection	Output Y4/Y5 Selection	PLL Frequency Selection	SSC Selection	Output Y6/Y7 Selection	PLL Frequency Selection	SSC Selection	Output Y8/Y9 Selection	Output Y1 and Power Down Selection

(1) Center/Down-Spread, Frequency0/1 and State0/1 are user-definable in PLLx Configuration Register
(2) Frequency0 and Frequency1 can be any frequency within the specified f_{VCO} range
(3) State0/1 selection is valid for both outputs of the corresponding PLL module and can be power down, 3-state, low, or active

Table 3. Y1 Setting(1)

Y1 SELECTION	
Y1	**FUNCTION**
0	State 0
1	State 1

(1) State0 and State1 are user definable in Generic Configuration Register and can be power down, 3-state, low, or active.

S1/SDA and S2/SCL pins of the CDCEx949 are dual function pins. In default configuration they are defined as SDA/SCL for the serial interface. They can be programmed as control-pins (S1/S2) by setting the relevant bits in the EEPROM. Note that the changes to the Control register (Bit [6] of Byte [02]) have no effect until they are written into the EEPROM.

Once they are set as control pins, the serial programming interface is no longer available. However, if V_{DDOUT} is forced to GND, the two control-pins, S1 and S2, temporally act as serial programming pins (SDA/SCL).

S0 is not a multi-use pin, it is a control pin only.

9.3.2 Default Device Setting

The internal EEPROM of CDCEx949 is preconfigured as shown in *Figure 6* (the input frequency is passed through to the output as a default). This allows the device to operate in default mode without the extra production step of program it. The default setting appears after power is supplied or after power-down or power-up sequence until it is re-programmed by the user to a different application configuration. A new register setting is programmed through the serial SDA/SCL Interface.

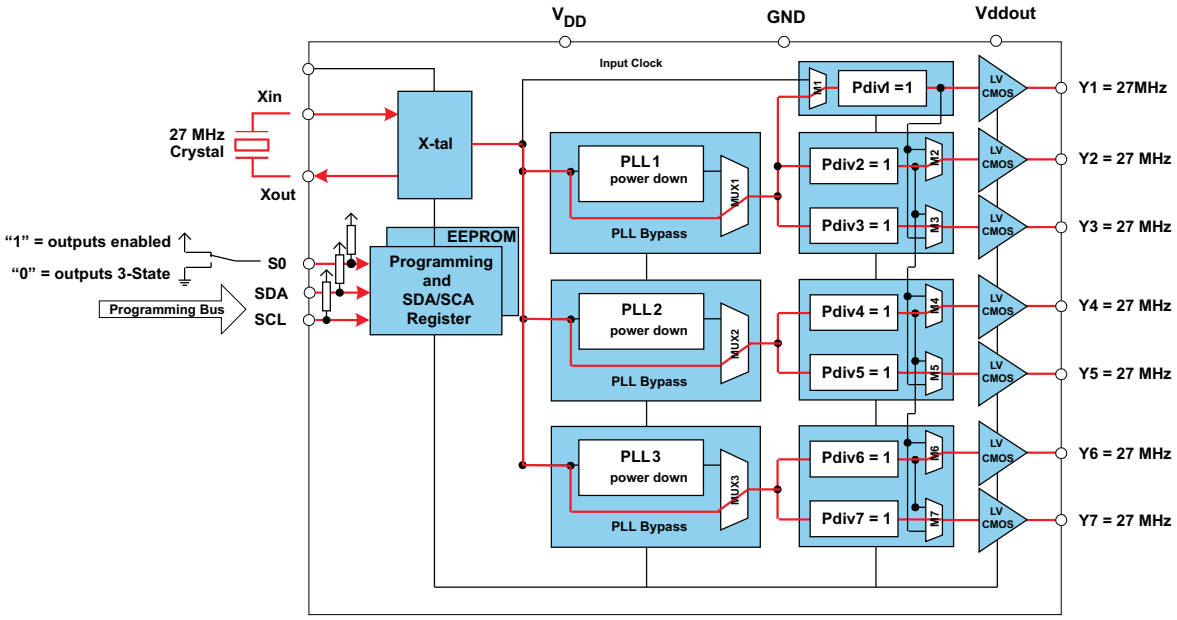

Figure 6. Default Device Setting

Table 4 shows the factory default setting for the Control Terminal Register (external control pins). In normal operation, all 8 register settings are available, but in the default configuration only the first two settings (0 and 1) can be selected with S0, as S1 and S2 configured as programming pins in default mode.

Table 4. Factory Default Setting for Control Terminal Register

			Y1	PLL1 SETTING			PLL2 SETTING			PLL3 SETTING			PLL3 SETTING		
EXTERNAL CONTROL PINS(1)			OUTPUT SELECT	FREQ. SELECT	SSC SEL.	OUTPUT SELECT	FREQ. SELECT	SSC SEL.	OUTPUT SELECT	FREQ. SELECT	SSC SEL.	OUTPUT SELECT	FREQ. SELECT	SSC SEL.	OUTPUT SELECT
S2	S1	S0	Y1	FS1	SSC1	Y2Y3	FS2	SSC2	Y4Y5	FS3	SSC3	Y6Y7	FS4	SSC4	Y8Y9
SCL (I^2C)	SDA (I^2C)	0	3-state	f_{VCO1_0}	off	3-state	f_{VCO2_0}	off	3-state	f_{VCO3_0}	off	3-state	f_{VCO4_0}	off	3-state
SCL (I^2C)	SDA (I^2C)	1	enabled	f_{VCO1_0}	off	enabled	f_{VCO2_0}	off	enabled	f_{VCO3_0}	off	enabled	f_{VCO4_0}	off	enabled

(1) In default mode or when programmed respectively, S1 and S2 act as serial programming interface, SDA/SCL. They do not have any control-pin function but they are internally interpreted as if S1 = 0 and S2 = 0. However, S0 is a control-pin which in the default mode switches all outputs ON or OFF (as previously predefined).

9.3.3 SDA/SCL Serial Interface

The CDCEx949 operates as a slave device of the 2-wire serial SDA/SCL bus, compatible with the popular *SMBus* or *I^2C Bus* specification. It operates in the standard-mode transfer (up to 100 kbps) and fast-mode transfer (up to 400 kbps) and supports 7-bit addressing.

The S1/SDA and S2/SCL pins of the CDCEx949 are dual function pins. In the default configuration they are used as SDA/SCL serial programming interface. They can be re-programmed as general-purpose control pins, S1 and S2, by changing the corresponding EEPROM setting, Byte 02, Bit [6].

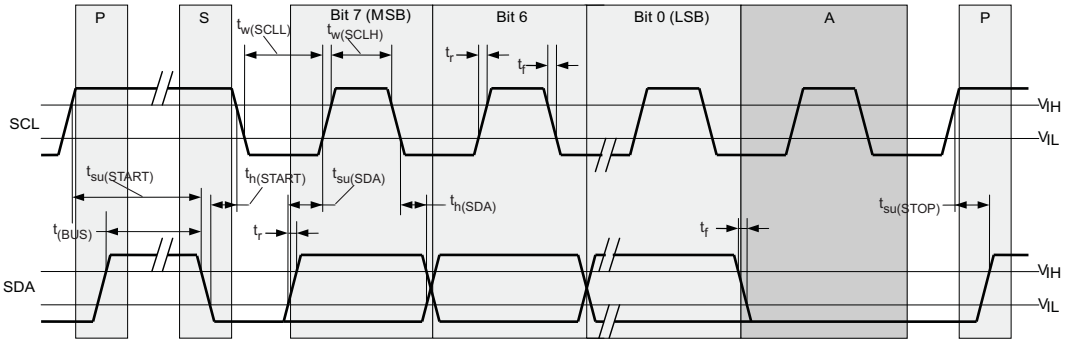

Figure 7. Timing Diagram for SDA/SCL Serial Control Interface

9.3.4 Data Protocol

The device supports *Byte Write and Byte Read* and *Block Write and Block Read* operations.

For *Byte Write/Read* operations, the system controller can individually access addressed bytes.

For *Block Write/Read* operations, the bytes are accessed in sequential order from lowest to highest byte (with most significant bit first) with the ability to stop after any complete byte has been transferred. The numbers of Bytes read-out are defined by Byte Count in the Generic Configuration Register. At Block Read instruction all bytes defined in the Byte Count has to be readout to correctly finish the read cycle.

Once a byte has been sent, it is written into the internal register and is effective immediately. This applies to each transferred byte independent of whether this is a *Byte Write* or a *Block Write* sequence.

If the EEPROM Write Cycle is initiated, the internal SDA register contents are written into the EEPROM. During this write cycle, data is not accepted at the SDA/SCL bus until the write cycle is completed. However, data can be read during the programming sequence (Byte Read or Block Read). The programming status can be monitored by reading *EEPIP*, Byte 01–Bit [6].

The offset of the indexed byte is encoded in the command code, as described in Table 5.

Table 5. Slave Receiver Address (7 Bits)

DEVICE	A6	A5	A4	A3	A2	A1(1)	A0(1)	R/$\overline{W}$
CDCEx913	1	1	0	0	1	0	1	1/0
CDCEx925	1	1	0	0	1	0	0	1/0
CDCEx937	1	1	0	1	1	0	1	1/0
CDCEx949	1	1	0	1	1	0	0	1/0

(1) Address bits A0 and A1 are programmable through the SDA/SCL bus (Byte 01, Bit [1:0]). This allows addressing up to 4 devices connected to the same SDA/SCL bus. The least-significant bit of the address byte designates a write or read operation.

9.4 Device Functional Modes

9.4.1 SDA/SCL Hardware Interface

Figure 8 shows how the CDCEx949 clock synthesizer is connected to the SDA/SCL serial interface bus. Multiple devices can be connected to the bus but the speed may need to be reduced (400 kHz is the maximum) if many devices are connected.

Device Functional Modes (continued)

Note that the pullup resistor value (R_P) depends on the supply voltage, bus capacitance and number of connected devices. The recommended pullup value is 4.7 kΩ. It must meet the minimum sink current of 3 mA at V_{OLmax} = 0.4 V for the output stages (for more details, see *SMBus* or *I²C Bus* specification).

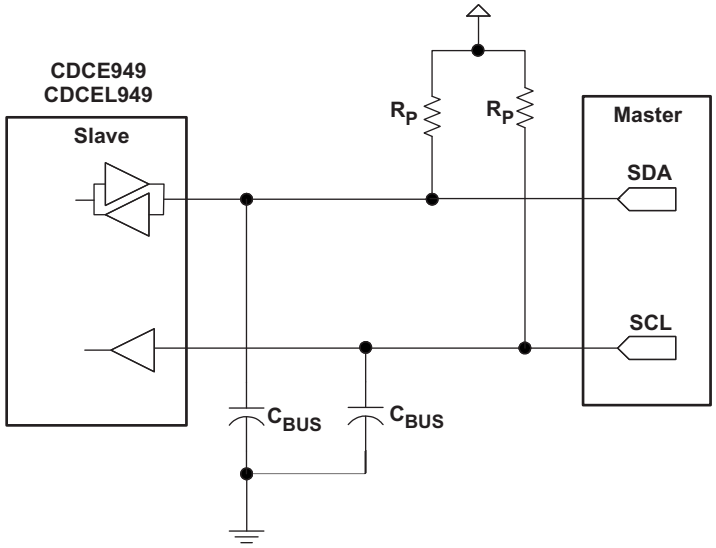

Figure 8. SDA/SCL Hardware Interface

9.5 Programming

Table 6. Command Code Definition

BIT	DESCRIPTION
7	0 = *Block Read* or *Block Write* operation 1 = *Byte Read* or *Byte Write* operation
(6:0)	Byte Offset for *Byte Read*, *Block Read*, *Byte Write* and *Block Write* operation.

9.6 Register Maps

9.6.1 SDA/SCL Configuration Registers

The clock input, control pins, PLLs, and output stages are user configurable. The following tables and explanations describe the programmable functions of the CDCEx949. All settings can be manually written to the device through the SDA/SCL bus, or are easily programmable by using the TI Pro Clock software. TI Pro Clock software allows the user to quickly make all settings and automatically calculates the values for optimized performance at lowest jitter.

Table 7. SDA/SCL Registers

ADDRESS OFFSET	REGISTER DESCRIPTION	TABLE
00h	Generic configuration register	Table 9
10h	PLL1 configuration register	Table 10
20h	PLL2 configuration register	Table 11
30h	PLL3 configuration register	Table 12
40h	PLL4 configuration register	Table 13

The grey-highlighted Bits described in the configuration registers tables on the following pages, belong to the Control Pin Register. The user can predefine up to eight different control settings. These settings can then be selected by the external control pins, S0, S1, and S2 (see *Control Terminal Setting*).

Table 8. Configuration Register, External Control Pins

EXTERNAL CONTROL PINS			Y1	PLL1 SETTING			PLL2 SETTING			PLL3 SETTING			PLL4 SETTING

Addr. Offset(1)			04h	13h	10h-12h	15h	23h	20h-22h	25h	33h	30h-32h	35h	43h	40h-42h	45h

(1) Address Offset refers to the byte address in the Configuration Register on following pages.

Table 9. Generic Configuration Register

OFFSET(1)	BIT(2)	ACRONYM	DEFAULT(3)	DESCRIPTION
00h	7	E_EL	xb	Device Identification (read only): '1' is CDCE949 (3.3V), '0' is CDCEL949 (1.8V)
	6:4	RID	Xb	Revision Identification Number (read only)
	3:0	VID	1h	Vendor Identification Number (read only)
01h	7	–	0b	Reserved - always write 0
	6	EEPIP	0b	EEPROM Programming Status(4): (read only) 0 – EEPROM programming is completed 1 – EEPROM is in programming mode
	5	EELOCK	0b	Permanently Lock EEPROM Data(5): 0 – EEPROM is not locked 1 – EEPROM is permanently locked
	4	PWDN	0b	Device power down (overwrites S0/S1/S2 setting; configuration register settings are unchanged) Note: PWDN cannot be set to 1 in the EEPROM. 0 – device active (all PLLs and all outputs are enabled) 1 – device power down (all PLLs in power down and all outputs in 3-State)
	3:2	INCLK	00b	Input clock selection: 00 – X-tal 01 – VCXO 10 – LVCMOS 11 – reserved
	1:0	SLAVE_ADR	00b	Programmable Address Bits A0 and A1 of the Slave Receiver Address

(1) Writing data beyond 50h may adversely affect device function.
(2) All data is transferred MSB-first.
(3) Unless custom setting is used.
(4) During EEPROM programming, no data is allowed to be sent to the device through the SDA/SCL bus until the programming sequence is completed. Data, however, can be read during the programming sequence (Byte Read or Block Read).
(5) If this bit is set high in the EEPROM, the actual data in the EEPROM is permanently locked, and no further programming is possible. Data, however can still be written through the SDA/SCL bus to the internal register to change device function on the fly. But new data can no longer be saved to the EEPROM. EELOCK is effective only if written into the EEPROM

Table 9. Generic Configuration Register (continued)

OFFSET(1)	BIT(2)	ACRONYM	DEFAULT(3)	DESCRIPTION
02h	7	M1	1b	Clock source selection for output Y1: 0 – input clock 1 – PLL1 clock
	6	SPICON	0b	Operation mode selection for pin 22/23(6) 0 – serial programming interface SDA (pin 23) and SCL (pin 22) 1 – control pins S1 (pin 23) and S2 (pin 22)
	5:4	Y1_ST1	11b	Y1-State0/1 Definition (applies to Y1_ST1 and Y1_ST0)
	3:2	Y1_ST0	01b	00 – device power down (all PLLs in power down and all outputs in 3-state) 01 – Y1 disabled to 3-state 10 – Y1 disabled to low 11 – Y1 enabled (normal operation)
	1:0	Pdiv1 [9:8]	001h	10-Bit Y1-Output-Divider Pdiv1: 0 – divider reset and stand-by 1-to-1023 – divider value
03h	7:0	Pdiv1 [7:0]		
04h	7	Y1_7	0b	Y1_x State Selection(7) 0 – State0 (predefined by Y1-State0 Definition [Y1_ST0]) 1 – State1 (predefined by Y1-State1 Definition [Y1_ST1])
	6	Y1_6	0b	
	5	Y1_5	0b	
	4	Y1_4	0b	
	3	Y1_3	0b	
	2	Y1_2	0b	
	1	Y1_1	1b	
	0	Y1_0	0b	
05h	7:3	XCSEL	0Ah	Crystal load capacitor selection(8): 00h → 0 pF 01h → 1 pF 02h → 2 pF 14h-to-1Fh → 20 pF 	2:0	—	0b	Reserved - do not write others than 0
06h	7:1	BCOUNT	50h	7-Bit Byte Count (Defines the number of Bytes which is sent from this device at the next Block Read transfer; all bytes must be read out to correctly finish the read cycle.)
	0	EEWRITE	0b	Initiate EEPROM Write Cycle(4) (9) 0 – no EEPROM write cycle 1 – start EEPROM write cycle (internal configuration register is saved to the EEPROM)
07h-0Fh	—	—	0h	Reserved – do not write others than 0

(6) Selection of *control-pins* is effective only if written into the EEPROM. Once written into the EEPROM, the serial programming pins are no longer available. However, if V_{DDOUT} is forced to GND, the two control-pins, S1 and S2, temporally act as serial programming pins (SDA/SCL), and the two slave receiver address bits are reset to A0 = 0 and A1 = 0.

(7) These are the bits of the Control Pin Register. The user can predefine up to eight different control settings. These settings can then be selected by the external control pins, S0, S1, and S2.

(8) The internal load capacitor (C_1, C_2) must be used to achieve the best clock performance. External capacitors must be used only to do a fine adjustment of C_L by few pF. The value of C_L can be programmed with a resolution of 1 pF for a total crystal load range of 0 pF to 20 pF. For C_L > 20 pF use additional external capacitors. Also, the device input capacitance must be considered; this adds 1.5 pF (6 pF, 2 pF) to the selected C_L. For more information about VCXO configuration and crystal recommendations, see *VCXO Application Guideline for CDCE(L)9xx Family* (SCAA085).

(9) NOTE: The EEPROM WRITE bit must be sent last. This ensures that the content of all internal registers are written into the EEPROM. The EEWRITE cycle is initiated by the rising edge of the EEWRITE-Bit. A static level high does not trigger an EEPROM WRITE cycle. The EEWRITE-Bit must be reset low after the programming is completed. The programming status can be monitored by readout EEPIP. If EELOCK is set high, no EEPROM programming is possible.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The CDCEx949 device is an easy-to-use high-performance, programmable CMOS clock synthesizer. it can be used as a crystal buffer, clock synthesizer with separate output supply pin. The CDCEx949 features an on-chip loop filter and Spread-spectrum modulation. Programming can be done through SPI, pin-mode, or using on-chip EEPROM. This section shows some examples of using CDCEx949 in various applications.

10.2 Typical Application

Figure 15 shows the use of the CDCEx949 devices for replacement of crystals and crystal oscillators on a Gigabit Ethernet Switch application.

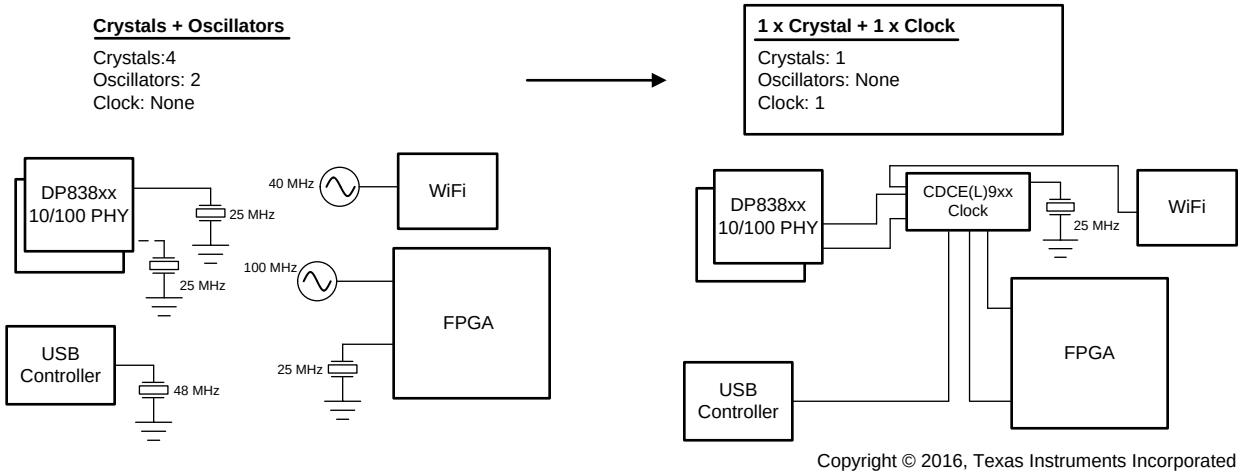

Figure 15. Crystal and Oscillator Replacement Example

10.2.1 Design Requirements

CDCEx949 supports spread spectrum clocking (SSC) with multiple control parameters:

- Modulation amount (%)
- Modulation frequency (>20 kHz)
- Modulation shape (triangular)
- Center spread / down spread (± or –)

Typical Application (continued)

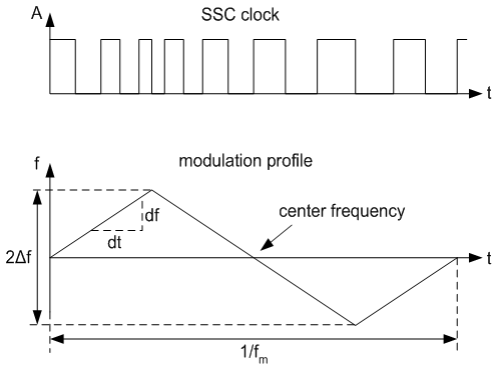

Figure 16. Modulation Frequency (fm) and Modulation Amount

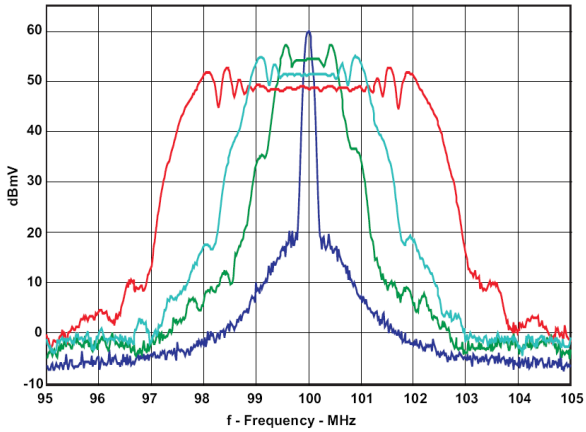
10.2.2 Detailed Design Procedure

10.2.2.1 Spread Spectrum Clock (SSC)

Spread spectrum modulation is a method to spread emitted energy over a larger bandwidth. In clocking, spread spectrum can reduce Electromagnetic Interference (EMI) by reducing the level of emission from clock distribution network.



CDCS502 with a 25-MHz Crystal, FS = 1, Fout = 100 MHz, and 0%, ±0.5, ±1%, and ±2% SSC

Figure 17. Comparison Between Typical Clock Power Spectrum and Spread-Spectrum Clock

10.2.2.2 PLL Frequency Planning

At a given input frequency (f_{IN}), the output frequency (f_{OUT}) of the CDCEx949 are calculated with Equation 1.

$$f_{OUT} = \frac{f_{IN}}{Pdiv} \times \frac{N}{M} \quad (1)$$

where

- M (1 to 511) and N (1 to 4095) are the multiplier/divide values of the PLL
- Pdiv (1 to 127) is the output divider

The target VCO frequency (f_{VCO}) of each PLL is calculated with Equation 2.

$$f_{VCO} = f_{IN} \times \frac{N}{M} \quad (2)$$

Typical Application (continued)

The PLL internally operates as fractional divider and needs the following multiplier/divider settings:

- N
- P = 4 – int($\log_2$N/M; if P < 0 then P = 0
- Q = int(N'/M)
- R = N′ – M × Q

where

N′ = N × 2^P
N ≥ M;
80 MHz ≤ f_{VCO} ≤ 230 MHz
16 ≤ Q ≤ 63
0 ≤ P ≤ 4
0 ≤ R ≤ 51

Example:

for f_{IN} = 27 MHz; M = 1; N = 4; Pdiv = 2

→ f_{OUT} = 54 MHz
→ f_{VCO} = 108 MHz
→ P = 4 – int($\log_2$4) = 4 – 2 = 2
→ N' = 4 × 2^2 = 16
→ Q = int(16) = 16
→ R = 16 – 16 = 0

for f_{IN} = 27 MHz; M = 2; N = 11; Pdiv = 2

→ f_{OUT} = 74.25 MHz
→ f_{VCO} = 148.50 MHz
→ P = 4 – int($\log_2$5.5) = 4 – 2 = 2
→ N' = 11 × 2^2 = 44
→ Q = int(22) = 22
→ R = 44 – 44 = 0

The values for P, Q, R, and N' are automatically calculated when using TI Pro-Clock™ software.

10.2.2.3 Crystal Oscillator Start-Up

When the CDCEx949 is used as a crystal buffer, crystal oscillator start-up dominates the start-up time compared to the internal PLL lock time. The following diagram shows the oscillator start-up sequence for a 27-MHz crystal input with an 8-pF load. The start-up time for the crystal is in the order of approximately 250 µs compared to approximately 10 µs of lock time. In general, lock time is an order of magnitude less compared to the crystal start-up time.

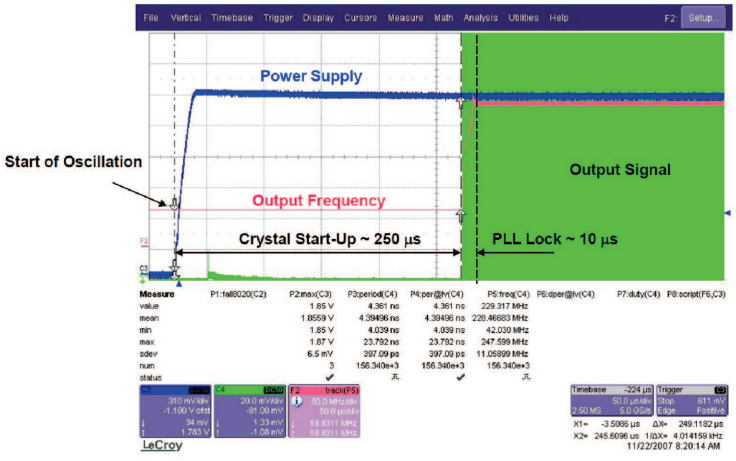


Figure 18. Crystal Oscillator Start-Up vs PLL Lock Time

Typical Application (continued)

10.2.2.4 Frequency Adjustment With Crystal Oscillator Pulling

The frequency for the CDCEx949 is adjusted for media and other applications with the VCXO control input V_{Ctrl}. If a PWM modulated signal is used as a control signal for the VCXO, an external filter is needed.

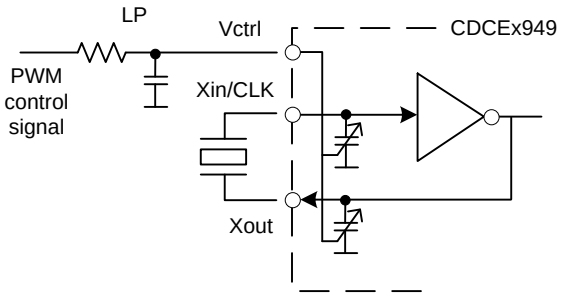

Figure 19. Frequency Adjustment Using PWM Input to the VCXO Control

10.2.2.5 Unused Inputs and Outputs

If VCXO pulling functionality is not required, V_{Ctrl} should be left floating. All other unused inputs should be set to GND. Unused outputs should be left floating.

If one output block is not used, TI recommends disabling it. However, TI always recommends providing the supply for the second output block even if it is disabled.

10.2.2.6 Switching Between XO and VCXO Mode

When the CDCEx949 is in crystal oscillator or in VCXO configuration, the internal capacitors require different internal capacitance. The following steps are recommended to switch to VCXO mode when the configuration for the on-chip capacitor is still set for XO mode. To center the output frequency to 0 ppm:

1. While in XO mode, put Vctrl = Vdd/2
2. Switch from X0 mode to VCXO mode
3. Program the internal capacitors to obtain 0 ppm at the output.

10.2.3 Application Curves

Figure 20, Figure 21, Figure 22, and Figure 23 show CDCEx949 measurements with the SSC feature enabled. Device configuration: 27-MHz input, 27-MHz output.

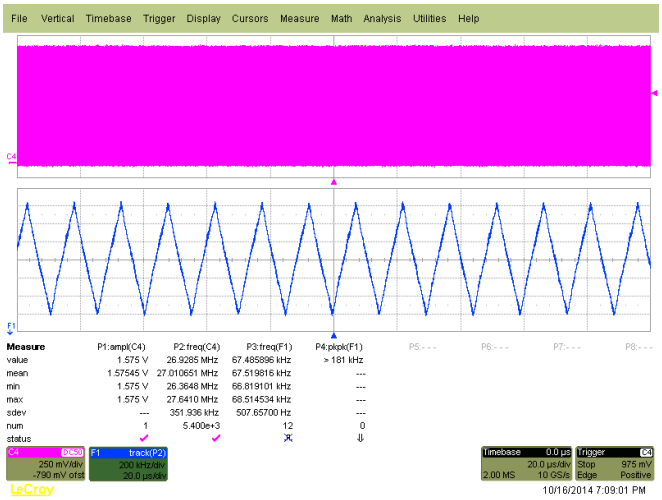

Figure 20. f_{OUT} = 27 MHz, VCO Frequency < 125 MHz, SSC (2% Center)

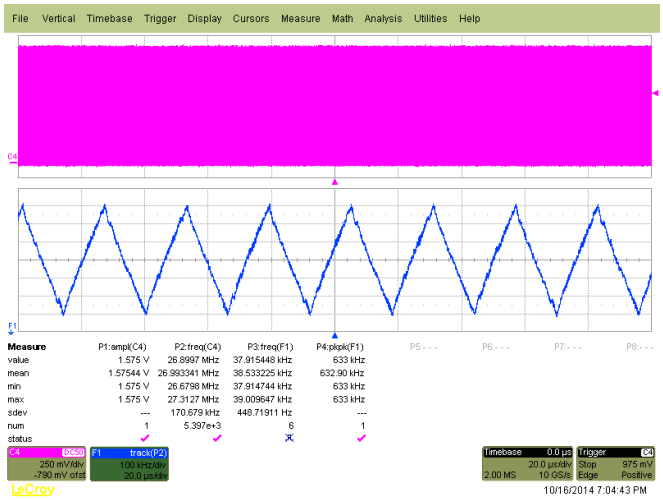

Figure 21. f_{OUT} = 27 MHz, VCO Frequency > 175 MHz, SSC (1%, Center)

Typical Application (continued)

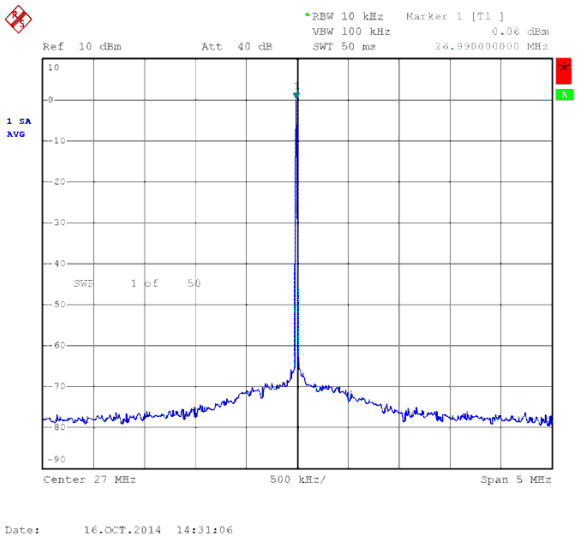

Figure 22. Output Spectrum With SSC Off

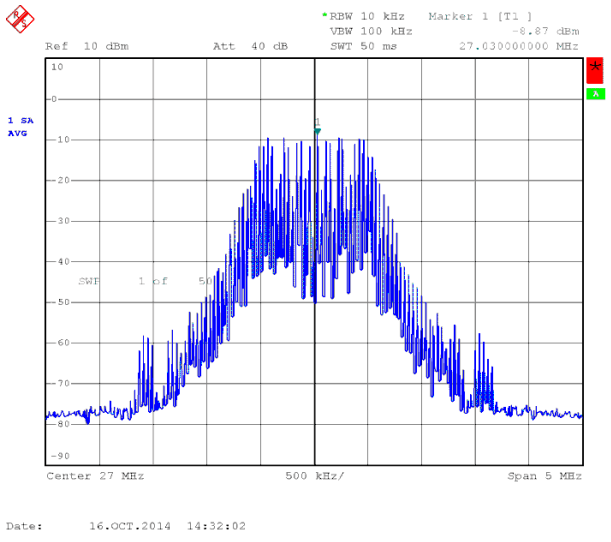

Figure 23. Output Spectrum With SSC On, 2% Center

11 Power Supply Recommendations

There is no restriction on the power-up sequence. In case the V_{DDOUT} is applied first, TI recommends grounding the V_{DD}. In case the V_{DDOUT} is powered while V_{DD} is floating, there is a risk of high current flowing on the V_{DDOUT}.

The device has a power-up control that is connected to the 1.8-V supply. This keeps the whole device disabled until the 1.8-V supply reaches a sufficient voltage level. Then the device switches on all internal components, including the outputs. If there is a 3.3-V V_{DDOUT} available before the 1.8-V, the outputs stay disabled until the 1.8-V supply reaches a certain level.

12 Layout

12.1 Layout Guidelines

When the CDCEx949 is used as a crystal buffer, any parasitics across the crystal affects the pulling range of the VCXO. Therefore, take care placing the crystal units on the board. Crystals must be placed as close to the device as possible, ensuring that the routing lines from the crystal terminals to XIN and XOUT have the same length.

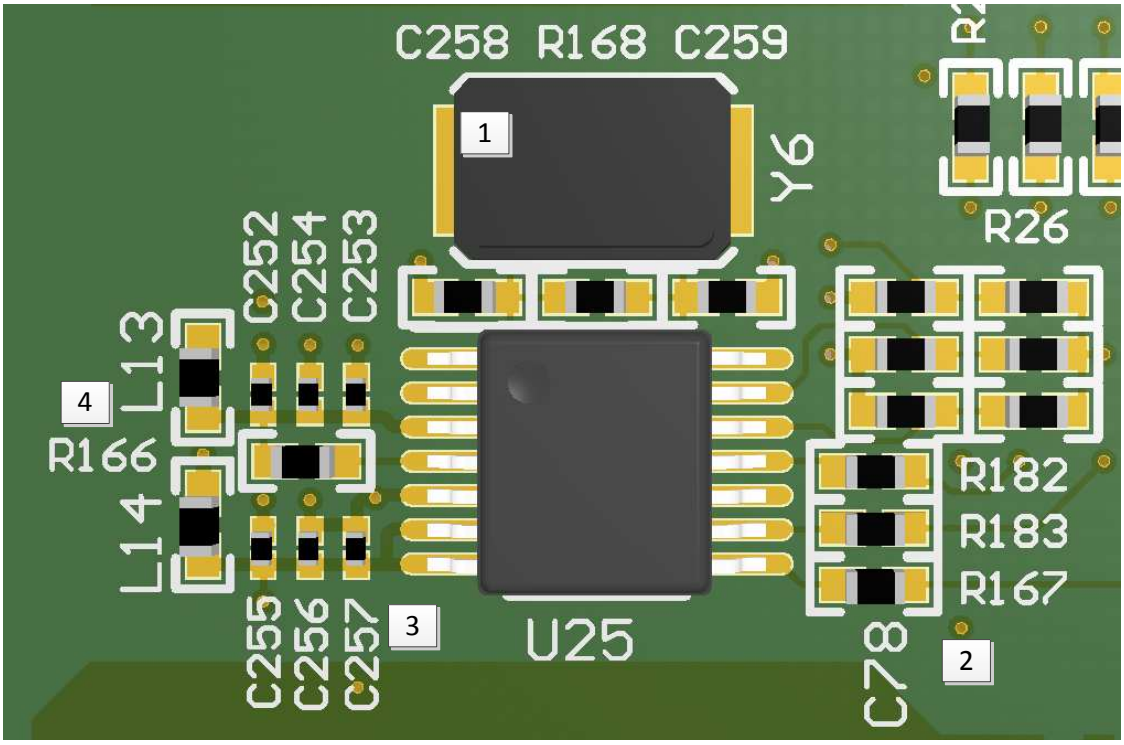
If possible, cut out both ground plane and power plane under the area where the crystal and the routing to the device are placed. In this area, always avoid routing any other signal line, as it could be a source of noise coupling.

Additional discrete capacitors can be required to meet the load capacitance specification of certain crystal. For example, a 10.7-pF load capacitor is not fully programmable on the chip, because the internal capacitor can range from 0 pF to 20 pF with steps of 1 pF. The 0.7-pF capacitor therefore can be discretely added on top of an internal 10-pF capacitor.

To minimize the inductive influence of the trace, TI recommends placing this small capacitor as close to the device as possible and symmetrically with respect to XIN and XOUT.

Figure 24 shows a conceptual layout detailing recommended placement of power supply bypass capacitors on the basis of CDCEx949. For component side mounting, use 0402 body size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low-impedance connection to the ground plane.

12.2 Layout Example



1 Place crystal with associated load caps as close to the chip	2 Place series termination resistors at Clock outputs to improve signal integrity
3 Place bypass caps close to the device pins, ensure wide freq. range	4 Use ferrite beads to isolate the device supply pins from board noise sources

Figure 24. Annotated Layout

13 Device and Documentation Support

13.1 Device Support

13.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

OTHER QUALIFIED VERSIONS OF CDCE949 :

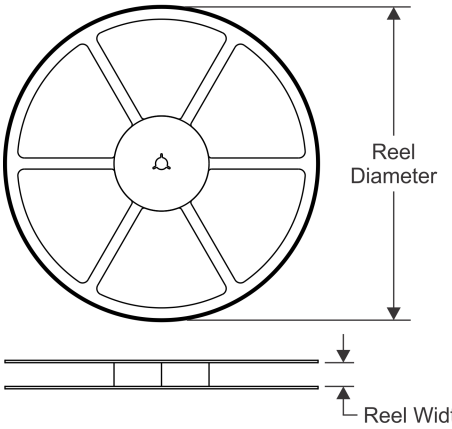
- Automotive: CDCE949-Q1

NOTE: Qualified Version Definitions:

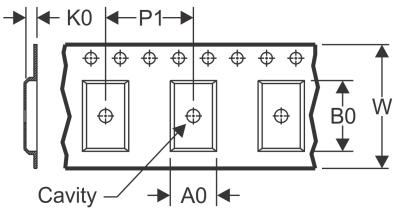
- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

TAPE AND REEL INFORMATION

REEL DIMENSIONS

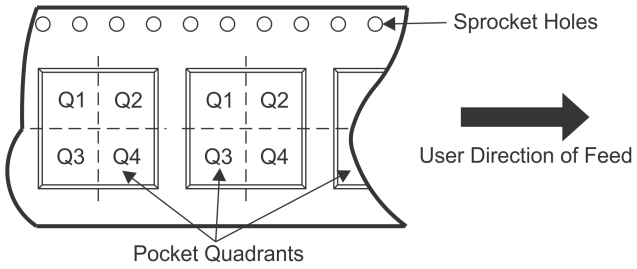


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

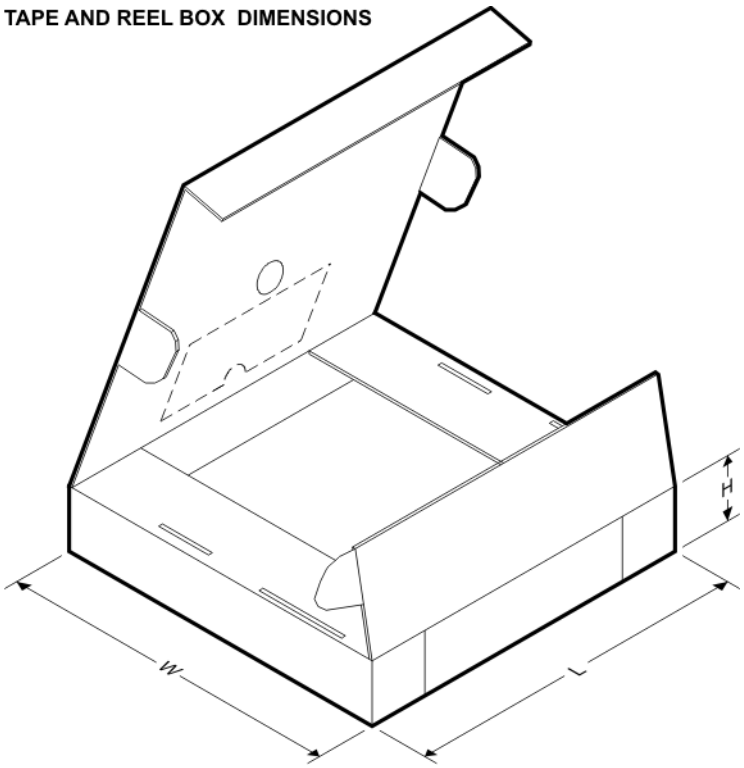
QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
CDCE949PWR	TSSOP	PW	24	2000	330.0	16.4	6.95	8.3	1.6	8.0	16.0	Q1
CDCEL949PWR	TSSOP	PW	24	2000	330.0	16.4	6.95	8.3	1.6	8.0	16.0	Q1

TAPE AND REEL BOX DIMENSIONS



*All dimensions are nominal

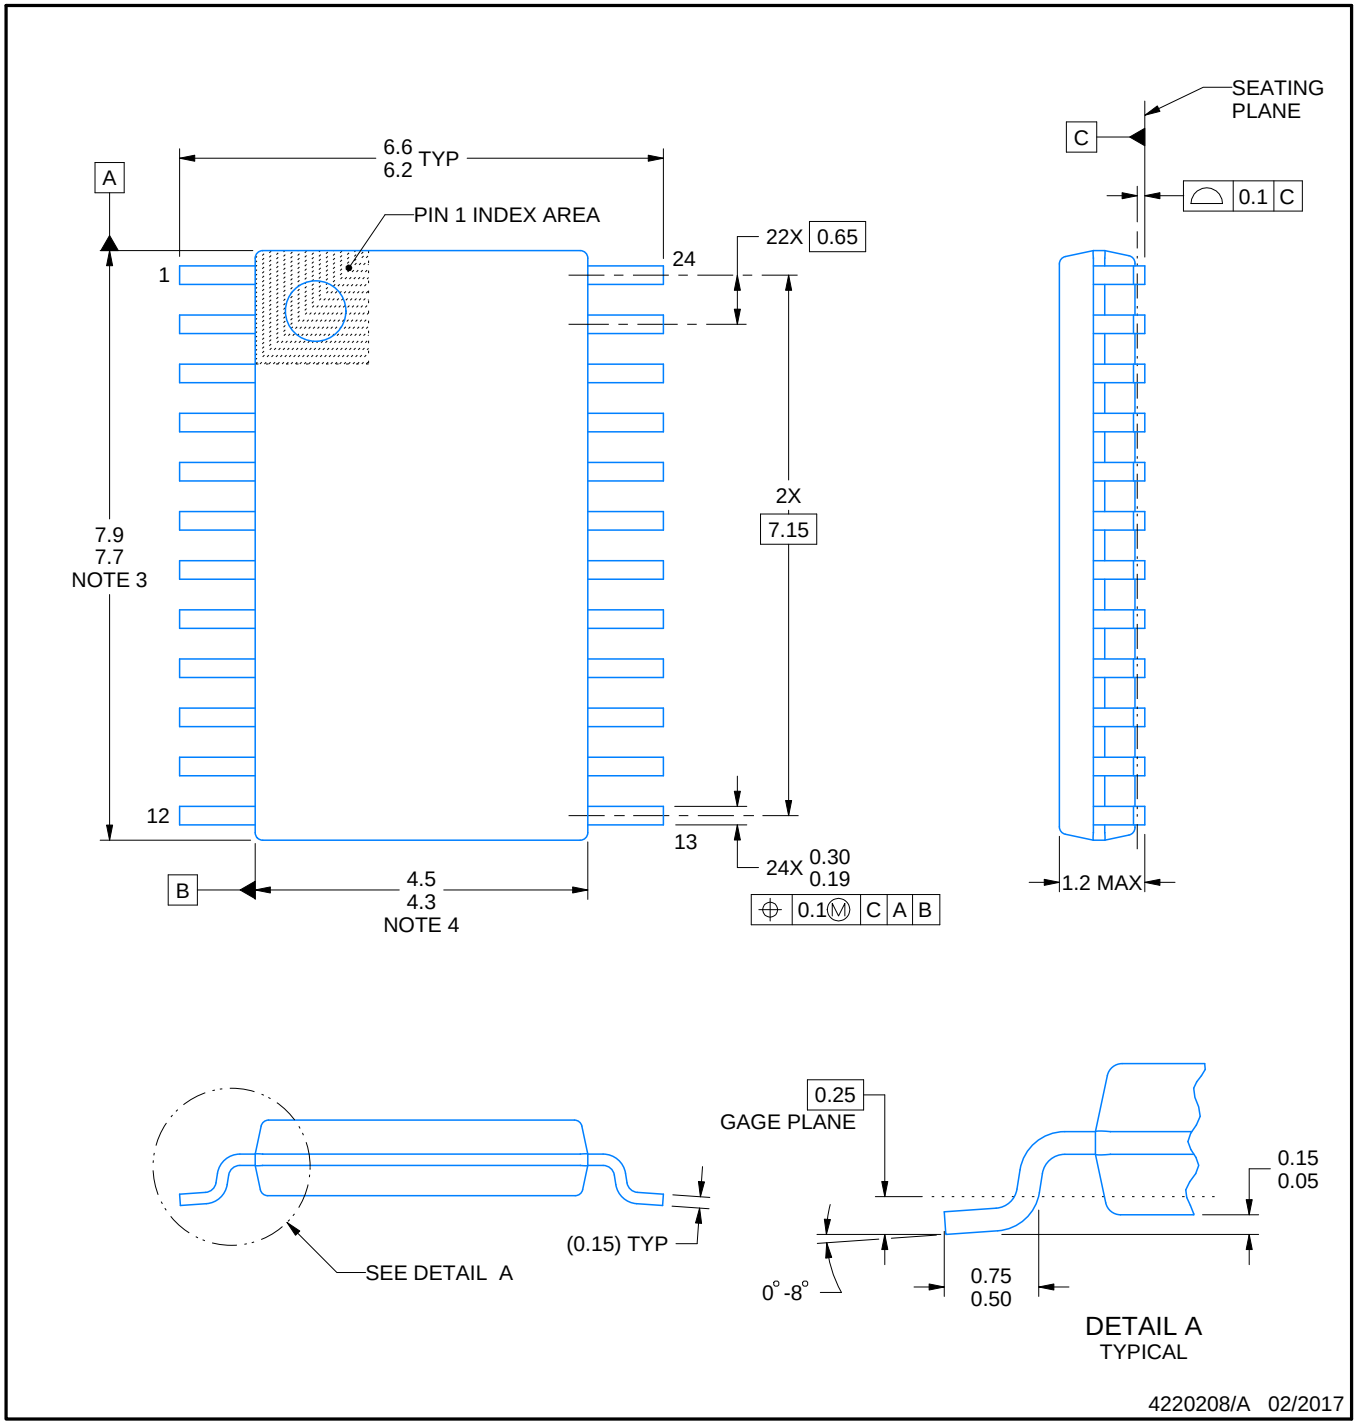
Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
CDCE949PWR	TSSOP	PW	24	2000	853.0	449.0	35.0
CDCEL949PWR	TSSOP	PW	24	2000	853.0	449.0	35.0

PACKAGE OUTLINE

PW0024A

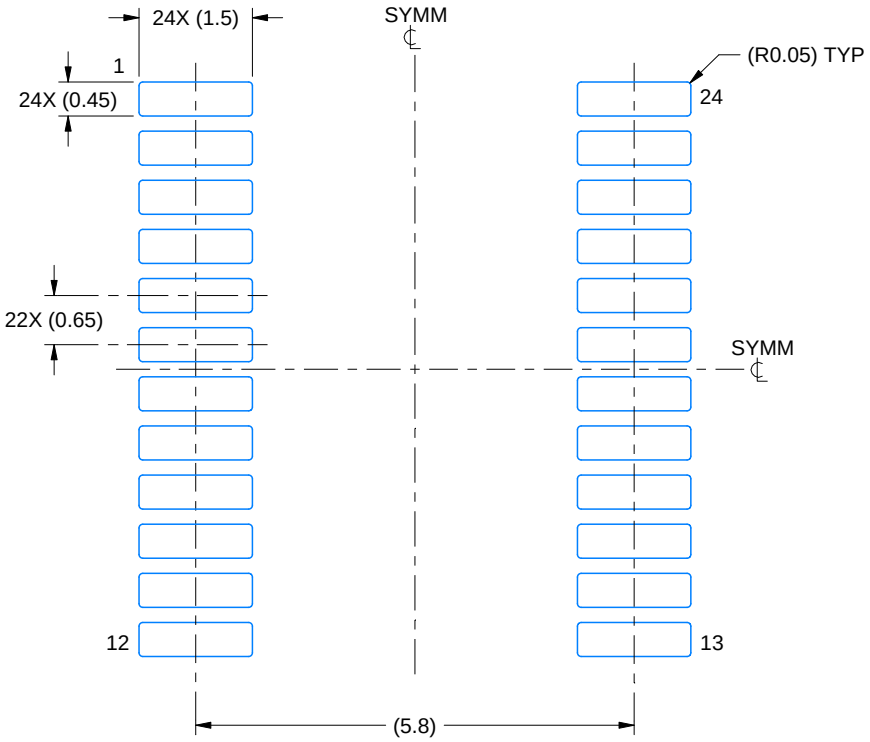
TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

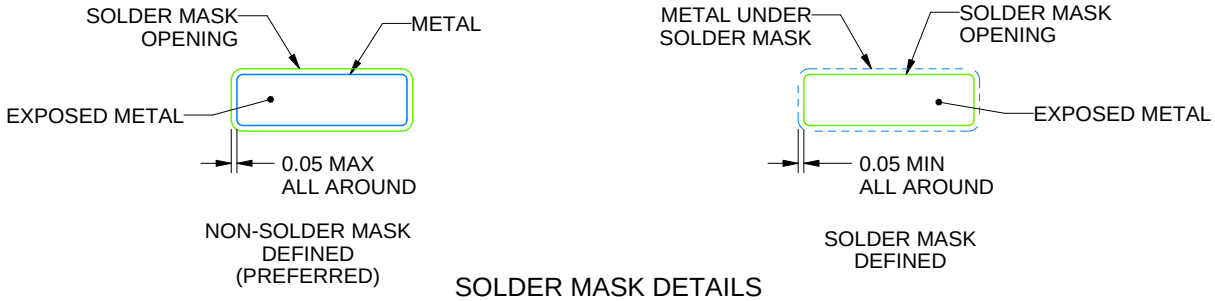


NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

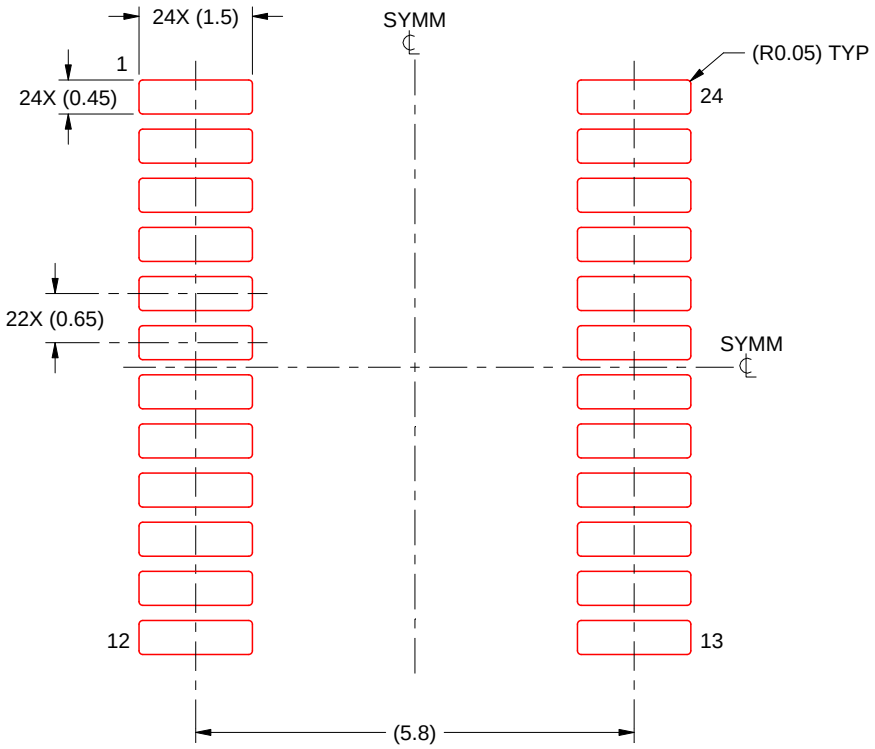


SOLDER MASK DETAILS

4220208/A 02/2017

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE: 10X

4220208/A 02/2017

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER
