3. Current Sharing/Remote Sense

The output of N+1 (N = 1, 2 ... 5) models can be shared. It is shown in Figure 3, one load-share controller is required for each model and circuits are identical when N+1 identical models are used.

Terminals J302 and J303 are connected to the Vo+ and Vo-, respectively, of the first power model. The Vo+ and Vo- correspond to the other models positive and negative output bus to the load. The J201 pin 1 and pin 3 connects to the S+ and S-, respectively, of the first power models. The S+ and S- correspond to the other models J201 pin 1 and pin 3. The S+ connects to positive output bus and S- connects to negative output bus.

Remote Sense< 250mV drop compensation:

The J201 Pin 4 connects to current sharing bus that it connects to other models J201 pin 4.

CHARACTERISTIC CURVES

Output vs. Temperature:

180 W convection cooled and 275 W continuous with 200 LFM airflow. Derate output power to 50% at 70°C.

Efficiency vs. Loading:

The high efficiency is achieved by using LLC technology, PFC topology minimizing switching losses. Synchronous MOSFET or SCHOTTY diode is used as rectifier in MINT1275 series because of high output voltage level.

CHARACTERISTIC CURVES

Ripple vs. Noise:

To verify that the output ripple and noise does not exceed the level specified in the product specification. Measured using a scope probe socket with 0.1 μ F ceramic and a 10 μ F electrolytic capacitor connected in parallel across it, BW limit with 20MHz.
