# $\angle \mathcal{C I M E R}$ 

## feATURES

- Ideal for Battery-Powered Applications
- Low Voltage: 1.8V to 16V Operation
- Low Current: 16uA/Amplifier Max
- Small Packages: DFN, MSOP, SSOP
- Shutdown to 1.5uA Max (LT6000, LT6001DD)
- Low Offset Voltage: $600 \mu \mathrm{~V}$ Max
- Rail-to-Rail Input and Output
- Fully Specified on 1.8 V and 5 V Supplies
- Operating Temperature Range: $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
- Single Available in DFN

Dual Available in MSOP and DFN
Quad Available in SSOP and DFN

## APPLICATIONS

- Gas Sensing
- Portable Instrumentation
- Battery- or Solar-Powered Systems
- Low Voltage Signal Processing
- Micropower Active Filters

## DESCRIPTIOn

The $\mathrm{LT}{ }^{\oplus} 6000 / \mathrm{LT} 6001 / \mathrm{LT} 6002$ are single, dual and quad precision rail-to-rail input and output operational amplifiers. Designed to maximize battery life in always-on applications, the devices will operate on supplies down to 1.8 V while drawing only $13 \mu \mathrm{~A}$ quiescient current. The low supply current and low voltage operation is combined with precision specifications; input offset is guaranteed less than $600 \mu \mathrm{~V}$. The performance on 1.8 V supplies is fully specified and guaranteed over temperature. A shutdown feature available in the LT6000 and the 10 -lead dual LT6001 version can be used to extend battery life by allowing the amplifiers to be switched off during periods of inactivity.

The LT6000 is available in a tiny, dual fine pitch leadless DFN package. The LT6001 is available in the 8-pin MSOP package; a 10-lead version with the shutdown feature is available in DFN package. The quad LT6002 is available in the 16-pin SSOP package and the 16-pin DFN package. These devices are specified over the commercial and industrial temperature range.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: A heat sink may be required to keep the junction temperature below the absolute maximum. This depends on the power supply voltage and how many amplifiers are shorted. The $\theta_{\mathrm{JA}}$ specified for the DD and DHC packages is with minimal PCB heat spreading metal. Using expanded metal area on all layers of a board reduces this value.
Note 3: The LT6000C/LT6000I/LT6001C/LT6001I and LT6002C/LT6002I are guaranteed functional over the temperature range of $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.
Note 4: The LT6000C/LT6001C/LT6002C is guaranteed to meet specified performance from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. The LT6000C/LT6001C/LT6002C are designed, characterized and expected to meet specified performance from
$-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ but are not tested or QA sampled at these temperatures. The LT6000I/LT6001I/ LT6002I is guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.
Note 5: This parameter is not $100 \%$ tested.
Note 6: Output voltage swings are measured between the output and power supply rails.
Note 7: Specifications apply to the LT6000 or the LT6001DD with shutdown.
Note 8: Guaranteed by correlation to slew rate at $\mathrm{V}_{\mathrm{S}}=1.8 \mathrm{~V}$ and GBW at $V_{S}=5 \mathrm{~V}$.
Note 9: Full-power bandwidth is calculated from the slew rate: FPBW $=S R / \pi V_{p-p}$.

## APPLICATIONS INFORMATION

## Supply Voltage

The positive supply of the LT6000/LT6001/LT6002 should be bypassed with a small capacitor (about $0.01 \mu$ F) within an inch of the pin. When driving heavy loads, an additional 4.7 FF electrolytic capacitor should be used. When using split supplies, the same is true for the negative supply pin.

## Rail-to-Rail Characteristics

The LT6000/LT6001/LT6002 are fully functional for an input signal range from the negative supply to the positive supply. Figure 1 shows a simplified schematic of the amplifier. The input stage consists of two differential amplifiers, a PNP stage Q3/Q6 and an NPN stage Q4/Q5 that are active over different ranges of the input common mode voltage. The PNP stage is active for common mode voltages, $\mathrm{V}_{\mathrm{CM}}$, between the negative supply to approximately 1 V below the positive supply. As $\mathrm{V}_{\mathrm{Cm}}$ moves closer towards the positive supply, the transistor $Q 7$ will steer Q2's tail currentto the current mirror Q8/Q9, activating the NPN differential pair. The PNP pair becomes inactive for
the rest of the input common mode range up to the positive supply.
The second stage is a folded cascode and current mirror that converts the input stage differential signals into a single ended output. Capacitor $\mathrm{C1}$ reduces the unity cross frequency and improves the frequency stability without degrading the gain bandwidth of the amplifier. The complementary drive generator supplies current to the output transistors that swing from rail to rail.

## Input

The input bias current depends on which stage is active. The input bias current polarity depends on the input common mode voltage. When the PNP stage is active, the input bias currents flow out of the input pins. They flow in the opposite direction when the NPN stage is active. The offset error due to the input bias currents can be minimized by equalizing the noninverting and inverting source impedance.

## LT6000/LT6001/LT6002

## APPLICATIONS InFORMATION

The input offset voltage changes depending on which input stage is active; input offset voltage is trimmed on both input stages, and is guaranteed to be $600 \mu \mathrm{~V}$ max in the PNP stage. By trimming the input offset voltage of both input stages, the input offset voltage over the entire common mode range (CMRR) is typically $400 \mu \mathrm{~V}$, maintaining the precision characteristics of the amplifier.
The input stage of the LT6000/LT6001/LT6002 incorporates phase reversal protection to prevent wrong polarity outputs from occurring when the inputs are driven up to 2 V below the negative rail. 30k protective resistors are included in the input leads so that current does not become excessive when the inputs are forced below $\mathrm{V}^{-}$or when a large differential signal is applied. Input current should be limited to 10 mA when the inputs are driven above the positive rail.

## Output

The output of the LT6000/LT6001/LT6002 can swing to within 30 mV of the positive rail with no load and within 30 mV of the negative rail with no load. When monitoring input voltages within 30 mV of the positive rail or within 30 mV of the negative rail, gain should be taken to keep the output from clipping. The LT6000/LT6001/LT6002 can typically source 10 mA on a single 5 V supply, sourcing current is reduced to 4 mA on a single 1.8 V supply as noted in the electrical characteristics.

The normally reverse-biased substrate diode from the output to $\mathrm{V}^{-}$will cause unlimited currents to flow when the output is forced below $\mathrm{V}^{-}$. If the current is transient and limited to 100 mA , no damage will occur.

## Start-Up and Output Saturation Characteristics

Micropower op amps are often not micropower during start-up characteristics or during output saturation. This can wreak havoc on limited current supplies, in the worst case there may not be enough supply current available to take the system up to nominal voltages. Also, when the output saturates, the part may draw excessive current and pull down the supplies, compromising rail-to-rail performance. Figure 1 shows the start-up characteristics of the LT6000/LT6001/LT6002 for three limiting cases. The circuits are shown in Figure 2. One circuit creates a positive offset forcing the output to come up saturated high. Another circuit creates a negative offset forcing the output to come up saturated low, while the last circuit brings the output up at $1 / 2$ supply. In all cases, the supply current is well controlled and is not excessive when the output is on either rail.

Figure 2. Circuits for Start-Up Characteristics

## APPLICATIONS INFORMATION

The LT6000/LT6001/LT6002 outputs can swing to within a respectable 30 mV of each rail and draw virtually no excessive supply current. Figure 3 compares the dual LT6001 to a competitive part. Both op amps are in unity gain and their outputs are driven into each rail. The supply current is shown when the op amps are in linear operation and when they are driven into each rail. As can be seen from Figure 3, the supply current of the competitive part increases 3 -fold or 5 -fold depending on which rail the output goes to whereas the LT6001 draws virtually no excessive current.

60012 F03
Figure 3. VOUT and ICC vs Input Voltage

## Gain

The open-loop gain is almost independent of load when the output is sourcing current. This optimizes performance in single supply applications where the load is returned to ground. The typical performance curve of Open-Loop Gain for various loads shows the details.

## Shutdown

The single LT6000 and the 10-lead dual LT6001 include a shutdown feature that disables the part reducing quiescent current and makes the output high impedance. The devices can be shut down by bringing the SHDN pin within 0.3 V of $\mathrm{V}^{-}$. The amplifiers are guaranteed to shut down if the $\overline{\text { SHDN }}$ pin is brought within 0.3 V of $\mathrm{V}^{-}$. The exact switchover point will be a function of the supply voltage. See the Typical Performance Characteristics curves Supply Current vs Shutdown Pin Voltage. When shut down the total supply current is about $0.8 \mu \mathrm{~A}$ and the output leakage current is $20 n A\left(V^{-} \leq V_{\text {OUT }} \leq \mathrm{V}^{+}\right)$. For normal operation the SHDN pin should be tied to $\mathrm{V}^{+}$. It can be left floating, however, parasitic leakage currents over $1 \mu \mathrm{~A}$ at the SHDN pin may inadvertently place the part into shutdown.
