

**FEATURES**

- Dual channel
- 16-bit resolution: **AD5547**
- 14-bit resolution: **AD5557**
- 2- or 4-quadrant, 6.8 MHz BW multiplying DAC
- $\pm 1$  LSB DNL
- $\pm 1$  LSB INL
- Operating supply voltage: 2.7 V to 5.5 V
- Low noise: 12 nV/ $\sqrt{\text{Hz}}$
- Low power:  $I_{DD} = 10 \mu\text{A}$  max
- 0.5  $\mu\text{s}$  settling time
- Built-in  $R_{FB}$  facilitates current-to-voltage conversion
- Built-in 4-quadrant resistors allow 0 V to  $-10$  V, 0 V to  $+10$  V, or  $\pm 10$  V outputs
- 2 mA full-scale current  $\pm 20\%$ , with  $V_{REF} = 10$  V
- Extended automotive operating temperature range  
 $-40^\circ\text{C}$  to  $+125^\circ\text{C}$
- Selectable zero-scale/midscale power-on presets
- Compact 38-lead TSSOP package

**APPLICATIONS**

- Automatic test equipment
- Instrumentation
- Digitally controlled calibration
- Digital waveform generation

**FUNCTIONAL BLOCK DIAGRAM**

Figure 1.

**GENERAL DESCRIPTION**

The **AD5547/AD5557** are dual precision, 16-/14-bit, multiplying, low power, current-output, parallel input, digital-to-analog converters (DACs). They are designed to operate from single  $+5$  V supply with  $\pm 10$  V multiplying references for 4-quadrant outputs with 6.8 MHz bandwidth.

The built-in, 4-quadrant resistors facilitate resistance matching and temperature tracking, which minimize the number of components needed for multiquadrant applications. In addition, the feedback resistor ( $R_{FB}$ ) simplifies the I-to-V conversion with an external buffer.

The **AD5547/AD5557** are available in a compact, 38-lead TSSOP package and operate at the extended automotive temperature range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .

<sup>1</sup> All static performance tests (except  $I_{OUT}$ ) are performed in a closed-loop system using an external precision OP97 I-to-V converter amplifier. The device  $R_{FB}$  terminal is tied to the amplifier output. The +IN pin of the OP97 is grounded, and the  $I_{OUT}$  of the DAC is tied to the OP97's -IN pin. Typical values represent average readings measured at 25°C.

<sup>2</sup> Guaranteed by design; not subject to production testing.

<sup>3</sup> All input control signals are specified with  $t_R = t_F = 2.5\ ns$  (10% to 90% of 3 V) and are timed from a voltage level of 1.5 V.

<sup>4</sup> All ac characteristic tests are performed in a closed-loop system using an AD8038 I-to-V converter amplifier except for THD where the AD8065 was used.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
$V_{DD}$ to GND	-0.3 V to +8 V
$R_{FB}$ , $R_{OF5}$ , $R1$ , $R_{COM}$ , and VREF to GND	-18 V to +18 V
Logic Inputs to GND	-0.3 V to +8 V
$V(I_{OUT})$ to GND	-0.3 V to $V_{DD} + 0.3$ V
Input Current to Any Pin except Supplies	$\pm 50$ mA
Thermal Resistance ( $\theta_{JA}$ ) <sup>1</sup>	
Maximum Junction Temperature ( $T_{JMAX}$ )	150°C
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature	
Vapor Phase, 60 sec	215°C
Infrared, 15 sec	220°C

<sup>1</sup> Package power dissipation =  $(T_{JMAX} - T_A)/\theta_{JA}$ .

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 4. AD5547 Pin Configuration

Table 3. AD5547 Pin Function Descriptions

Pin No.	Mnemonic	Function
1, 2, 24 to 28, 30 to 38	D0 to D15	Digital Input Data Bits D0 to D15. Signal level must be $\leq V_{DD} + 0.3 V$ .
3	$R_{OFSA}$	Bipolar Offset Resistor A. Accepts up to $\pm 18 V$ . In 2-quadrant mode, $R_{OFSA}$ ties to $R_{FBA}$ . In 4-quadrant mode, $R_{OFSA}$ ties to $R_{1A}$ and the external reference.
4	$R_{FBA}$	Internal Matching Feedback Resistor A. Connects to the external op amp for I-to-V conversion.
5	$R_{1A}$	4-Quadrant Resistor. In 2-quadrant mode, $R_{1A}$ shorts to the $V_{REFA}$ pin. In 4-quadrant mode, $R_{1A}$ ties to $R_{OFSA}$ . Do not connect when operating in unipolar mode.
6	$R_{COMA}$	Center Tap Point of the Two 4-Quadrant Resistors, $R_{1A}$ and $R_{2A}$ . In 4-quadrant mode, $R_{COMA}$ ties to the inverting node of the reference amplifier. In 2-quadrant mode, $R_{COMA}$ shorts to the associated $V_{REFA}$ pin. Do not connect if operating in unipolar mode.
7	$V_{REFA}$	DAC A Reference Input in 2-Quadrant Mode, R2 Terminal in 4-Quadrant Mode. In 2-quadrant mode, $V_{REFA}$ is the reference input with constant input resistance vs. code. In 4-quadrant mode, $V_{REFA}$ is driven by the external reference amplifier.
8	$I_{OUTA}$	DAC A Current Output. Connects to the inverting terminal of external precision I-to-V op amp for voltage output.
9	AGNDA	DAC A Analog Ground.
10	DGND	Digital Ground.
11	AGNDB	DAC B Analog Ground.
12	$I_{OUTB}$	DAC B Current Output. Connects to inverting terminal of external precision I-to-V op amp for voltage output.
13	$V_{REFB}$	DAC B Reference Input Pin. Establishes DAC full-scale voltage. Constant input resistance vs. code. If configured with an external op amp for 4-quadrant multiplying, $V_{REFB}$ becomes $-V_{REF}$ .
14	$R_{COMB}$	Center Tap Point of the Two 4-Quadrant Resistors, $R_{1B}$ and $R_{2B}$ . In 4-quadrant mode, $R_{COMB}$ ties to the inverting node of the reference amplifier. In 2-quadrant mode, $R_{COMB}$ shorts to the $V_{REFB}$ pin. Do not connect if operating in unipolar mode.
15	$R_{1B}$	4-Quadrant Resistor. In 2-quadrant mode, $R_{1B}$ shorts to the $V_{REFB}$ pin. In 4-quadrant mode, $R_{1B}$ ties to $R_{OFSB}$ . Do not connect if operating in unipolar mode.
16	$R_{FBB}$	Internal Matching Feedback Resistor B. Connects to external op amp for I-to-V conversion.
17	$R_{OFSB}$	Bipolar Offset Resistor B. Accepts up to $\pm 18 V$ . In 2-quadrant mode, $R_{OFSB}$ ties to $R_{FBB}$ . In 4-quadrant mode, $R_{OFSB}$ ties to $R_{1B}$ and an external reference.
18	$\overline{WR}$	Write Control Digital Input In, Active Low. $\overline{WR}$ transfers shift register data to the DAC register on the rising edge. Signal level must be $\leq V_{DD} + 0.3 V$ .

Pin No.	Mnemonic	Function
19	A0	Address Pin 0. Signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
20	A1	Address Pin 1. Signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
21	LDAC	Digital Input Load DAC Control. Signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
22	MSB	Power-On Reset State. MSB = 0 corresponds to zero-scale reset; MSB = 1 corresponds to midscale reset. The signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
23	$\overline{\text{RS}}$	Active low resets both input and DAC registers. Resets to zero-scale if MSB = 0 and resets to midscale if MSB = 1. Signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
29	VDD	Positive Power Supply Input. The specified range of operation is 2.7 V to 5.5 V.

Figure 5. AD5557 Pin Configuration

Table 4. AD5557 Pin Function Descriptions

Pin No.	Mnemonic	Function
1, 2	NC	No Connection. Do not connect anything other than the dummy pads to these pins.
3	R <sub>OFSA</sub>	Bipolar Offset Resistor A. Accepts up to $\pm 18$ V. In 2-quadrant mode, R <sub>OFSA</sub> ties to R <sub>FBA</sub> . In 4-quadrant mode, R <sub>OFSA</sub> ties to R <sub>1A</sub> and the external reference.
4	R <sub>FBA</sub>	Internal Matching Feedback Resistor A. Connects to the external op amp for I-to-V conversion.
5	R <sub>1A</sub>	4-Quadrant Resistor. In 2-quadrant mode, R <sub>1A</sub> shorts to the V <sub>REFA</sub> pin. In 4-quadrant mode, R <sub>1A</sub> ties to R <sub>OFSA</sub> . Do not connect when operating in unipolar mode.
6	R <sub>COMA</sub>	Center Tap Point of the Two 4-Quadrant Resistors, R <sub>1A</sub> and R <sub>2A</sub> . In 4-quadrant mode, R <sub>COMA</sub> ties to the inverting node of the reference amplifier. In 2-quadrant mode, R <sub>COMA</sub> shorts to the V <sub>REFA</sub> pin. Do not connect if operating in unipolar mode.
7	V <sub>REFA</sub>	DAC A Reference Input in 2-Quadrant Mode, R2 Terminal in 4-Quadrant Mode. In 2-quadrant mode, V <sub>REFA</sub> is the reference input with constant input resistance vs. code. In 4-quadrant mode, V <sub>REFA</sub> is driven by the external reference amplifier.
8	I <sub>OUTA</sub>	DAC A Current Output. Connects to the inverting terminal of external precision I-to-V op amp for voltage output.
9	AGNDA	DAC A Analog Ground.
10	DGND	Digital Ground.
11	AGNDB	DAC B Analog Ground.
12	I <sub>OUTB</sub>	DAC B Current Output. Connects to inverting terminal of external precision I-to-V op amp for voltage output.
13	V <sub>REFB</sub>	DAC B Reference Input Pin. Establishes DAC full-scale voltage. Constant input resistance vs. code. If configured with an external op amp for 4-quadrant multiplying, V <sub>REFB</sub> becomes $-V_{REF}$ .
14	R <sub>COMB</sub>	Center Tap Point of the Two 4-Quadrant Resistors, R <sub>1B</sub> and R <sub>2B</sub> . In 4-quadrant mode, R <sub>COMB</sub> ties to the inverting node of the reference amplifier. In 2-quadrant mode, R <sub>COMB</sub> shorts to the V <sub>REFB</sub> pin. Do not connect if operating in unipolar mode.
15	R <sub>1B</sub>	4-Quadrant Resistor. In 2-quadrant mode, R <sub>1B</sub> shorts to the V <sub>REFB</sub> pin. In 4-quadrant mode, R <sub>1B</sub> ties to R <sub>OFSB</sub> . Do not connect if operating in unipolar mode.
16	R <sub>FBB</sub>	Internal Matching Feedback Resistor B. Connects to external op amp for I-to-V conversion.
17	R <sub>OFSB</sub>	Bipolar Offset Resistor B. Accepts up to $\pm 18$ V. In 2-quadrant mode, R <sub>OFSB</sub> ties to R <sub>FBB</sub> . In 4-quadrant mode, R <sub>OFSB</sub> ties to R <sub>1B</sub> and an external reference.
18	WR	Write Control Digital Input In, Active Low. Transfers shift register data to the DAC register on the rising edge. Signal level must be $\leq V_{DD} + 0.3$ V.
19	A0	Address Pin 0. Signal level must be $\leq V_{DD} + 0.3$ V.
20	A1	Address Pin 1. Signal level must be $\leq V_{DD} + 0.3$ V.
21	LDAC	Digital Input Load DAC Control. Signal level must be $\leq V_{DD} + 0.3$ V.
22	MSB	Power-On Reset State. MSB = 0 corresponds to zero-scale reset; MSB = 1 corresponds to midscale reset. The signal level must be $\leq V_{DD} + 0.3$ V.

Pin No.	Mnemonic	Function
23	$\overline{RS}$	Active low resets both input and DAC registers. Resets to zero-scale if MSB = 0 and resets to midscale if MSB = 1. Signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
24 to 28, 30 to 38	D13 to D0	Digital Input Data Bits D13 to D0. Signal level must be $\leq V_{DD} + 0.3\text{ V}$ .
29	VDD	Positive Power Supply Input. The specified range of operation is 2.7 V to 5.5 V.

Table 5. Address Decoder Pins

# CIRCUIT OPERATION

## DAC SECTION

The AD5547/AD5557 are 16-/14-bit, multiplying, current-output, parallel input DACs. The devices operate from a single 2.7 V to 5.5 V supply and provide both unipolar (0 V to  $-V_{REF}$  or 0 V to  $+V_{REF}$ ) and bipolar ( $\pm V_{REF}$ ) output ranges from  $-18$  V to  $+18$  V references. In addition to the precision conversion  $R_{FB}$  commonly found in current output DACs, there are three additional precision resistors for 4-quadrant bipolar applications.

The AD5547/AD5557 consist of two groups of precision R-2R ladders, which make up the 12/10 LSBs, respectively. Furthermore, the 4 MSBs are decoded into 15 segments of resistor value 2R. Figure 18 shows the architecture of the 16-bit AD5547. Each of the 16 segments and the R-2R ladder carries an equally weighted current of one-sixteenth of full scale. The feedback resistor  $R_{FB}$  and 4-quadrant resistor  $R_{OFS}$  have values of 10 k $\Omega$ . Each 4-quadrant resistor, R1 and R2, equals 5 k $\Omega$ . In 4-quadrant operation, R1, R2, and an external op amp work together to invert the reference voltage and apply it to the  $V_{REF}$  input. With  $R_{OFS}$  and  $R_{FB}$  connected as shown in Figure 2, the output can swing from  $-V_{REF}$  to  $+V_{REF}$ .

The reference voltage inputs exhibit a constant input resistance of 5 k $\Omega \pm 20\%$ . The impedance of  $I_{OUT}$ , the DAC output, is code dependent. External amplifier choice should take into account the variation of the AD5547/AD5557 output impedance. The feedback resistance in parallel with the DAC ladder resistance dominates output voltage noise. To maintain good analog performance, it is recommended that the power supply is bypassed with a 0.01  $\mu$ F to 0.1  $\mu$ F ceramic or chip capacitor in parallel with a 1  $\mu$ F tantalum capacitor. Also, to minimize gain error, PCB metal traces between  $V_{REF}$  and  $R_{FB}$  should match.

Every code change of the DAC corresponds to a step function; gain peaking at each output step may occur if the op amp has limited GBP and excessive parasitic capacitance present at the inverting node of the op amp. A compensation capacitor, therefore, may be needed between the I-to-V op amp inverting and output nodes to smooth the step transition. Such a compensation capacitor should be found empirically, but a 20 pF capacitor is generally adequate for the compensation.

The  $V_{DD}$  power is used primarily by the internal logic to drive the DAC switches. Note that the output precision degrades if the operating voltage falls below the specified voltage. Users should also avoid using switching regulators because device power supply rejection degrades at higher frequencies.

Figure 18. 16-Bit AD5547 Equivalent R-2R DAC Circuit with Digital Section, One Channel Shown

04452-011

## DIGITAL SECTION

The AD5547/AD5557 have 16-/14-bit parallel inputs. The devices are double buffered with 16-/14-bit registers. The double buffered feature allows the simultaneous update of several AD5547s/AD5557s. For the AD5547, the input register is loaded directly from a 16-bit controller bus when  $\overline{WR}$  is brought low. The DAC register is updated with data from the input register when LDAC is brought high. Updating the DAC register updates the DAC output with the new data (see Figure 18). To make both registers transparent, tie  $\overline{WR}$  low and LDAC high. The asynchronous  $\overline{RS}$  pin resets the part to zero scale if MSB = 0 and to midscale if MSB = 1.

### ESD Protection Circuits

All logic input pins contain back-biased ESD protection Zeners connected to ground (DGND) and  $V_{DD}$ , as shown in Figure 19. As a result, the voltage level of the logic input should not be greater than the supply voltage.

Figure 19. Equivalent ESD Protection Circuits

### Amplifier Selection

In addition to offset voltage, the bias current is important in op amp selection for precision current output DACs. A 30 nA input bias current in the op amp contributes to 1 LSB in the full-scale error of the AD5547. The OP1177 and AD8628 op amps are good candidates for the I-to-V conversion.

### Reference Selection

The initial accuracy and rated output of the voltage reference determine the full-span adjustment. The initial accuracy of the reference is usually a secondary concern because it can be trimmed. Figure 25 shows an example of a trimming circuit. The zero-scale error can also be minimized by standard op amp nulling techniques.

The voltage reference temperature coefficient (TC) and long-term drift are primary considerations. For example, a 5 V reference with a TC of 5 ppm/°C means the output changes by 25  $\mu\text{V}/^\circ\text{C}$ . As a result, a reference operating at 55°C contributes an additional 750  $\mu\text{V}$  full-scale error.

Similarly, the same 5 V reference with a  $\pm 50$  ppm long-term drift means the output may change by  $\pm 250$   $\mu\text{V}$  over time. Therefore, it is practical to calibrate a system periodically to maintain its optimum precision.

## PCB LAYOUT, POWER SUPPLY BYPASSING, AND GROUND CONNECTIONS

It is a good practice to employ a compact, minimum lead length, PCB layout design. The leads to the input should be as short as possible to minimize IR drop and stray inductance.

The PCB metal traces between  $V_{REF}$  and  $R_{FB}$  should also be matched to minimize gain error.

It is also essential to bypass the power supply with quality capacitors for optimum stability. Supply leads to the device should be bypassed with 0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$  disc or chip ceramic capacitors. Low ESR 1  $\mu\text{F}$  to 10  $\mu\text{F}$  tantalum or electrolytic capacitors should also be applied at the supply in parallel with the ceramic capacitor to minimize transient disturbance and filter out low frequency ripple.

To minimize the digital ground bounce, the AD5547/AD5557 DGND terminal should be joined with the AGND terminal at a single point. Figure 20 illustrates the basic supply bypassing configuration and AGND/DGND connection for the AD5547/AD5557.

# APPLICATIONS INFORMATION

## UNIPOLAR MODE

### 2-Quadrant Multiplying Mode, $V_{OUT} = 0\text{ V to }-V_{REF}$

The AD5547/AD5557 DAC architecture uses a current-steering R-2R ladder design that requires an external reference and op amp to convert the unipolar mode of the output voltage to

$$V_{OUT} = -V_{REF} \times D/65,536 \text{ (AD5547)} \quad (1)$$

$$V_{OUT} = -V_{REF} \times D/16,384 \text{ (AD5557)} \quad (2)$$

where  $D$  is the decimal equivalent of the input code.

In this case, the output voltage polarity is opposite the  $V_{REF}$  polarity (see Figure 21). Table 7 shows the negative output vs. code for the AD5547.

Table 7. AD5547 Unipolar Mode Negative Output vs. Code

D in Binary	$V_{OUT}$ (V)
1111 1111 1111 1111	$-V_{REF}$ (65,535/65,536)
1000 0000 0000 0000	$-V_{REF}/2$
0000 0000 0000 0001	$-V_{REF}$ (1/65,536)
0000 0000 0000 0000	0

Figure 21. Unipolar 2-Quadrant Multiplying Mode,  $V_{OUT} = 0\text{ to }-V_{REF}$

04452-007

**2-Quadrant Multiplying Mode,  $V_{OUT} = 0\text{ V to }+V_{REF}$**

The AD5547/AD5557 are designed to operate with either positive or negative reference voltages. As a result, a positive output can be achieved with an additional op amp, (see Figure 22); the output becomes

$$V_{OUT} = +V_{REF} \times D/65,536 \text{ (AD5547)} \quad (3)$$

$$V_{OUT} = +V_{REF} \times D/16,384 \text{ (AD5557)} \quad (4)$$

Table 8 shows the positive output vs. code for the AD5547.

**Table 8. AD5547 Unipolar Mode Positive Output vs. Code**

D in Binary	$V_{OUT}$ (V)
1111 1111 1111 1111	$+V_{REF}(65,535/65,536)$
1000 0000 0000 0000	$+V_{REF}/2$
0000 0000 0000 0001	$+V_{REF}(1/65,536)$
0000 0000 0000 0000	0

Figure 22. Unipolar 2-Quadrant Multiplying Mode,  $V_{OUT} = 0\text{ to }+V_{REF}$

04452-005

**BIPOLAR MODE**

**4-Quadrant Multiplying Mode,  $V_{OUT} = -V_{REF}$  to  $+V_{REF}$**

The AD5547/AD5557 contain on-chip all the 4-quadrant resistors necessary for precision bipolar multiplying operation. Such a feature minimizes the number of exponent components to only a voltage reference, dual op amp, and compensation capacitor (see Figure 23). For example, with a +10 V reference, the circuit yields a precision, bipolar -10 V to +10 V output.

$$V_{OUT} = (D/32768 - 1) \times V_{REF} \text{ (AD5547)} \quad (5)$$

$$V_{OUT} = (D/16384 - 1) \times V_{REF} \text{ (AD5557)} \quad (6)$$

Table 9 shows some of the results for the 16-bit AD5547.

**Table 9. AD5547 Output vs. Code**

D in Binary	$V_{OUT}$
1111 1111 1111 1111	$+V_{REF}$ (32,767/32,768)
1000 0000 0000 0001	$+V_{REF}$ (1/32,768)
1000 0000 0000 0000	0
0111 1111 1111 1111	$-V_{REF}$ (1/32,768)
0000 0000 0000 0000	$-V_{REF}$

04482-006

**AC Reference Signal Attenuator**

Besides handling the digital waveform decoded from the parallel input data, the AD5547/AD5557 can also handle low frequency ac reference signals for signal attenuation, channel equalization, and waveform generation applications. The maximum signal range can be up to  $\pm 18$  V (see Figure 24).

**System Calibration**

The initial accuracy of the system can be adjusted by trimming the voltage reference ADR0x with a digital potentiometer (see Figure 25). The AD5170 provides a one-time programmable (OTP), 8-bit adjustment that is ideal and reliable for such calibration. Analog Devices, Inc., OTP digital potentiometer comes with programmable software that simplifies factory calibration.

Figure 25. Full-Span Calibration

## REFERENCE SELECTION

When selecting a reference for use with the AD55xx series of current output DACs, pay attention to the output voltage, temperature coefficient specification of the reference. Choosing a precision reference with a low output temperature coefficient minimizes error sources. Table 10 lists some of the references available from Analog Devices, Inc., that are suitable for use with this range of current output DACs.

## AMPLIFIER SELECTION

The primary requirement for the current-steering mode is an amplifier with low input bias currents and low input offset voltage. Because of the code-dependent output resistance of the DAC, the input offset voltage of an op amp is multiplied by the variable gain of the circuit. A change in this noise gain between two adjacent digital fractions produces a step change in the output voltage due to the amplifier's input offset voltage. This output voltage change is superimposed upon the desired change in output between the two codes and gives rise to a differential linearity error, which, if large enough, can cause the DAC to be nonmonotonic.

The input bias current of an op amp also generates an offset at the voltage output because of the bias current flowing in the feedback resistor,  $R_{FB}$ .

Common-mode rejection of the op amp is important in voltage-switching circuits because it produces a code-dependent error at the voltage output of the circuit.

Provided that the DAC switches are driven from true wideband low impedance sources ( $V_{IN}$  and AGND), they settle quickly. Consequently, the slew rate and settling time of a voltage-switching DAC circuit is determined largely by the output op amp. To obtain minimum settling time in this configuration, minimize capacitance at the  $V_{REF}$  node (the voltage output node in this application) of the DAC. This is done by using low input capacitance buffer amplifiers and careful board design.

Analog Devices offers a wide range of amplifiers for both precision dc and ac applications, as listed in Table 11 and Table 12.
