MAXIM

Quad, Low-Voltage, SPST Analog Switches with Enable

General Description

The MAX4536/MAX4537/MAX4538 are quad, low-voltage, single-pole/single-throw (SPST) analog switches with a common enable pin. They are pin compatible with the industry-standard 74HC4316. The MAX4536 has four normally open (NO) switches, and the MAX4537 has four normally closed (NC) switches. The MAX4538 has two NO switches and two NC switches.

These switches operate from a +2V to +12V single supply, or from ±2V to ±6V dual supplies. On-resistance (200Ω max) is matched between switches to 4Ω (max) and is flat (10Ω max) over the specified signal range. Each switch can handle rail-to-rail analog signals. The off-leakage current is only 1nA at +25°C and 10nA at +85°C.

All digital inputs have 0.8V to 2.4V logic thresholds, ensuring TTL/CMOS-logic compatibility when using a single +5V supply or dual ±5V supplies.

Features

- **Pin Compatible with 74HC4316**
- **±2.0V to ±6V Dual Supplies**
  +2.0V to +12V Single Supply
- **Four Separately Controlled SPST Switches with Common Enable**
- **100Ω Signal Paths with Dual ±5V Supplies**
  200Ω Signal Paths with Single +4.5V Supply
- **Rail-to-Rail Signal Handling**
- **t_{ON} and t_{OFF} = 100ns and 80ns at ±4.5V Supply**
- **Less than 1µW Power Consumption**
- **>2kV ESD Protection per Method 3015.7**
- **TTL/CMOS-Compatible Inputs**
- **Small Packages: PDIP, QSOP, Narrow SO**

Note 1: Signals on NC_, NO_, COM_, $\overline{EN}$, or IN_ exceeding V+ or V- are clamped by internal diodes. Limit forward-diode current to maximum current rating.
Note 2: All leads are soldered or welded to PC boards.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 3: The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.
Note 4: Guaranteed by design.
Note 5: $\Delta R_{ON} = \Delta R_{ON(MAX)} - \Delta R_{ON(MIN)}$.
Note 6: Resistance flatness is defined as the difference between the maximum and the minimum value of on-resistance as measured over the specified analog-signal range.
Note 7: Leakage parameters are 100% tested at maximum rated hot temperature and guaranteed by correlation at T_A = +25°C.
Note 8: Off-isolation = $20\log_{10}$ [$V_{COM\_}$ / ($V_{NC\_}$ or $V_{NO\_}$)], $V_{COM\_}$ = output, $V_{NC\_}$ or $V_{NO\_}$ = input to off switch.
Note 9: Between any two switches.
Note 10: Leakage testing for single-supply operation is guaranteed by testing with dual supplies.

Pin Description

PIN	NAME	FUNCTION
1, 4, 10, 13	COM1–COM4	Analog Switch Common* Terminals
2, 3, 11, 12	NO1–NO4, or NC1–NC4	Analog Switch Normally Open* or Normally Closed* Terminals (see *Truth Tables*)
5, 6, 14, 15	IN1–IN4	Logic-Control Digital Inputs. Control each switch (see *Truth Tables*), except when $\overline{EN}$ is high.
7	$\overline{EN}$	Disable Logic Input. Connect logic high to $\overline{EN}$ to disable (open) all switches.
8	GND	Ground. Connect to digital ground. (Analog signals have no ground reference; they are limited to V+ and V-.)
9	V-	Negative Analog Supply-Voltage Input. Connect V- to GND for single-supply operation.
16	V+	Positive Analog and Digital Supply-Voltage Input. Internally connected to substrate.

**NO_/NC_ and COM_ pins are identical and interchangeable. Either may be considered as an input or an output; signals pass equally well in either direction.*

Power-Supply Considerations

Overview

The MAX4536/MAX4537/MAX4538 construction is typical of most CMOS analog switches. These devices have three supply pins: V+, V-, and GND. V+ and V- drive the internal CMOS switches and set the limits of the analog voltage on any switch. Reverse ESD-protection diodes are internally connected between each analog-signal pin, and both V+ and V-. One of these diodes conducts if any analog signal exceeds V+ or V-. These reverse-biased ESD diodes leak during normal operation, forming the only current drawn from V+ or V-.

Virtually all the analog leakage current is through the ESD diodes. Although the ESD diodes on a given signal pin are identical and therefore fairly well balanced, they are reverse biased differently. Each is biased by either V+ or V- and the analog signal. This means their leakages vary as the signal varies. The *difference* in the two diode leakages from the signal path to the V+ and V- pins constitutes the analog-signal path leakage current. All analog leakage current flows to the supply terminals, not to the other switch terminal. This explains how both sides of a given switch can show leakage currents of either the same or opposite polarity.

There is no connection between the analog-signal paths and GND. The analog-signal paths consist of an N-channel and P-channel MOSFET with their sources and drains paralleled and their gates driven out of phase to V+ and V- by the logic-level translators.

V+ and GND power the internal logic and logic-level translators and set the input logic thresholds. The logic-level translators convert the logic levels to switched V+ and V- signals to drive the analog switches' gates. This drive signal is the only connection between the logic supplies and the analog supplies. V+, and V- have ESD-protection diodes to GND. The logic-level inputs have ESD protection to V+ and to V-.

Increasing V- has no effect on the logic-level thresholds, but it does increase the drive to the P-channel switches, reducing their on-resistance. V- also sets the negative limit of the analog-signal voltage.

The logic-level thresholds are CMOS/TTL-compatible when V+ is +5V. The threshold increases slightly as V+ is raised. When V+ reaches +12V, the level threshold is about 3.1V, above the TTL output high-level minimum of 2.8V, but still compatible with CMOS outputs.

Bipolar Supplies

The MAX4536/MAX4537/MAX4538 operate with bipolar supplies between ±2.0V and ±6V. The V+ and V- supplies need not be symmetrical, but their sum cannot exceed the absolute maximum rating of 13.0V. **Do not connect the MAX4536/MAX4537/MAX4538's V+ to +3V and then connect the logic-level input pins to TTL logic-level signals. TTL logic-level outputs in excess of the absolute maximum ratings can damage the part and/or external circuits.**

CAUTION: The absolute maximum V+ to V- differential voltage is 13.0V. Typical ±6V or +12V supplies with ±10% tolerances can be as high as 13.2V. This voltage can damage the MAX4536/MAX4537/MAX4538. Even ±5% tolerance supplies may have overshoot or noise spikes that exceed 13.0V.

Single Supplies

The MAX4536/MAX4537/MAX4538 operate from single supplies between +2.0V and +12V when V- is connected to GND. All of the bipolar precautions must be observed.

High-Frequency Performance

In 50Ω systems, signal response is reasonably flat up to 50MHz (see *Typical Operating Characteristics*). Above 20MHz, the on-response has several minor peaks that are highly layout dependent. The problem with high-frequency operation is not in turning the switch on, but in turning it off. The off-state switch acts like a capacitor and passes higher frequencies with less attenuation. At 10MHz, off-isolation is about -44dB in 50Ω systems, becoming worse (approximately 20dB per decade) as frequency increases. Higher circuit impedances also make off-isolation worse. Adjacent channel attenuation is about 3dB above that of a bare IC socket, and is due entirely to capacitive coupling.
