MAX25610 Evaluation Kit

Evaluates: MAX25610A

General Description

The MAX25610 evaluation kit (EV kit) provides a proven design to evaluate the MAX25610A automotive high-voltage, high-brightness LED (HB LED) controller. The EV kit is set up for buck-boost configurations and operates from a 5V to 18V DC supply voltage. The EV kit is configured to deliver up to 1.1A to one string of LEDs. The total voltage of the string can vary from 3V to 16V. The anode of the LED string should go to the LED+ terminal and the cathode should go to the LEDEXT- terminal.

Benefits and Features

- 5V to 18V Input Voltage Range
- Demonstrates Analog Dimming Control, Digital Dimming Control
- Demonstrates External and Internal Current Sensing
- Demonstrates LED Short and Open Protection
- Proven PCB Layout
- Fully Assembled and Tested

***Ordering Information* appears at end of data sheet.**

Quick Start

Required Equipment

- MAX25610 EV kit
- 12V, 5A DC power supply
- A series-connected LED string rated for at least 1.5A
- Oscilloscope with a current probe

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

Caution: Do not turn on power supply until all connections are made.

1) Verify that all jumpers are in their default positions, as shown in Table 1.
2) Connect the positive terminal of the 12V supply to the V_{IN} Board PCB pad and the negative terminal to the GND_Board PCB pad.
3) Connect the LED string across the LED+ and LEDEXT- PCB pads on the EV kit. The anode of the LED string should go to the LED+ PCB pad and the cathode of the LED string should go to the LEDEXT- PCB pad.
4) Clip the current probe on the wire connected to the LED string.
5) Turn on the DC power supply.
6) Verify that the LEDs illuminate.
7) Verify that the oscilloscope displays approximately 1A.

maxim integrated™

Detailed Description

The MAX25610 evaluation kit (EV kit) provides a proven design to evaluate the MAX25610A automotive high-voltage, high-brightness LED (HB LED) controller. The EV kit is set up for buck-boost configurations and operates from a 5V to 18V DC supply voltage. The EV kit is configured to deliver up to 1.1A to one string of LEDs. The total voltage of the string can vary from 3V to 16V. The anode of the LED string should go to the LED+ terminal and the cathode should go to the LEDEXT- terminal.

Analog Dimming Control (REFI)

When J1 is closed, the LED current is set by external current sensing. The equation to set the LED current is as follows:

$$I_{LED} = \frac{V_{REFI} - 200mV}{6.67 \times R_{LED}}$$

In the case of the EV kit, ILED is set to 1A.

When J1 is open, the LED current is set by internal current sensing. The equation to set the LED current is $I_{LED} = 13125/R_{REFI}$.

PWM Dimming

The EV kit demonstrates the PWM dimming feature of the MAX25610A using either an external PWM signal or a DC voltage at the PWMDIM pin.

Analog-to-PWM dimming:

Keep J2 open and J7 closed as described in Table 1 and remove the 0.1µF C8 capacitor. PWM dimming duty cycle is set by the voltage at PWMDIM between 0.2V (0% duty) and 3V (100% duty). Alternatively, drive the PWMDIM test point with an external DC source. PWMDIM voltages greater than 3V set the dimming duty cycle to 100%.

External PWM dimming:

Keep J2 open and J7 open. Install the 0.1µF C8 capacitor (installed by default). Connect an external PWM signal to the PWMDIM test point. Vary the duty cycle to increase or decrease the intensity of the HB LED string. The PWMDIM input of the device has a 2V (max) rising threshold and a 0.4V (min) falling threshold, and is compatible with 3.3V and 5V logic-level signals.

Table 1. MAX25610 EV Kit Jumper Descriptions

JUMPER	SHUNT POSITION	DESCRIPTION
J1	Closed*	For external current sense. The voltage on the REFI pin is adjusted from 0.2V to 1.2V to set the LED current as follows: $I_{LED} = (V_{REFI} - 0.2)/6.67 \times R_{LED}$
	Open	For internal current sense. The potentiometer R23 is adjusted for setting the LED current as follows: $I_{LED} = 13125/R_{REFI}$
J2	1–2	Connects PWMDIM pin to GND and no switching
	2–3*	Connects PWMDIM pin to V_{EE} (Internal 5V) for 100% duty
J4	Open	Connect an external clock source to perform PWM dimming with J7 open. With J7 closed, the potentiometer R34 is adjusted to set the DC voltage on the PWMDIM pin to perform analog PWM dimming. The capacitor C8 must be removed to perform analog PWM dimming. See the IC datasheet for PWM frequency setting.
	1–2*	External current sense
	2–3	Internal current sense
J7	Open*	For external PWM dimming
	Closed	For analog PWM dimming

Current Sensing

External current sensing:

Keep J1 closed and J4 closed in the 1–2 position, as described in Table 1, and adjust the potentiometer R23 to set the LED current.

Internal current sensing:

Keep J1 open and J4 closed in the 2–3 position, as described in Table 1, and adjust the potentiometer R23 to set the LED current.

Faults

Open and Short LEDs:

When the IC detects the open or short fault conditions of the LEDs, the fault pin is pulled low. The fault pin also goes low when there is an overtemperature condition. The fault pin is an active-low, open-drain output.

Short to Battery:

The EV kit has a latch circuit with a switch for protection when there is a short on the LEDEXT- wire to battery positive voltage.
