

FEATURES

- Complete Step-Down Switch Mode Power Supply
- Wide Input Voltage Range: 3.6V to 36V
- 0.8V to 10V Output Voltage
- 1A Output Current
- Adjustable Switching Frequency: 200kHz to 2.4MHz
- Current Mode Control
- (e4) RoHS Compliant Package with Gold Pad Finish
- Programmable Soft-Start
- Tiny, Low Profile (11.25mm × 9mm × 2.82mm) Surface Mount LGA Package

APPLICATIONS

- Automotive Battery Regulation
- Power for Portable Products
- Distributed Supply Regulation
- Industrial Supplies
- Wall Transformer Regulation

DESCRIPTION

The LTM[®]8022 is a complete 1A, DC/DC step-down power supply. Included in the package are the switching controller, power switches, inductor, and all support components. Operating over an input voltage range of 3.6V to 36V, the LTM8022 supports an output voltage range of 0.8V to 10V, and a switching frequency range of 200kHz to 2.4MHz, each set by a single resistor. Only the bulk input and output filter capacitors are needed to finish the design.

The low profile package (2.82mm) enables utilization of unused space on the bottom of PC boards for high density point of load regulation.

The LTM8022 is packaged in a thermally enhanced, compact (11.25mm × 9mm) and low profile (2.82mm) overmolded land grid array (LGA) package suitable for automated assembly by standard surface mount equipment. The LTM8022 is RoHS compliant.

LT, LT, LTC, LTM, Linear Technology, Burst Mode and the Linear logo are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

TYPICAL APPLICATION

7V_{IN} to 36V_{IN}, 5V/1A μ Module[®] Regulator

| $V_{PG(TH)}$ | PG Threshold | V_{FB} Rising | | 730 | | mV |
| I_{PGO} | PG Leakage | $V_{PG} = 30\text{V}$ | | 0.1 | 1 | μA |
| $I_{PG(SINK)}$ | PG Sink Current | $V_{PG} = 0.4\text{V}$ | 200 | 800 | | μA |
| $V_{SYNC(IL)}$ | SYNC Low Threshold | $f_{SYNC} = 550\text{kHz}$, $C_{OUT} = 51\mu\text{F}$ | 0.5 | | | V |
| $V_{SYNC(IH)}$ | SYNC High Threshold | $f_{SYNC} = 550\text{kHz}$, $C_{OUT} = 51\mu\text{F}$ | | | 0.7 | V |
| $I_{SYNC(BIAS)}$ | SYNC Pin Bias Current | $V_{SYNC} = 0\text{V}$ | | 0.1 | | μA |

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: The LTM8022E is guaranteed to meet performance specifications from 0°C to 85°C ambient. Specifications over the full -40°C to 85°C ambient operating temperature range are assured by design, characterization and correlation with statistical process controls. The LTM8022I is guaranteed to meet specifications over the full -40°C to 85°C ambient operating temperature range. The LTM8022MP is guaranteed to

meet specifications over the full -55°C to 125°C temperature range. Note that the maximum internal temperature is determined by specific operating conditions in conjunction with board layout, the rated package thermal resistance and other environmental factors.

Note 3: Guaranteed by design.

Note 4: $C_{OUT} = 51\mu\text{F}$ is composed of a $4.7\mu\text{F}$ ceramic capacitor and a $47\mu\text{F}$ electrolytic.

Note 5: Short circuit current at $V_{IN} = 36\text{V}$ is guaranteed by characterization and correlation. 100% tested at $V_{IN} = 10\text{V}$.

PIN FUNCTIONS

V_{IN} (Bank 1): The V_{IN} pin supplies current to the LTM8022's internal regulator and to the internal power switch. This pin must be locally bypassed with an external, low ESR capacitor of at least 2.2μF.

V_{OUT} (Bank 2): Power Output Pins. Apply the output filter capacitor and the output load between these pins and GND pins.

AUX (Pin F5): Low current voltage source for BIAS. In many designs, the BIAS pin is simply connected to V_{OUT}. The AUX pin is internally connected to V_{OUT} and is placed adjacent to the BIAS pin to ease printed circuit board routing. Although this pin is internally connected to V_{OUT}, do NOT connect this pin to the load. If this pin is not tied to BIAS, leave it floating. The Application Information section gives specific information about the BIAS and AUX connections

BIAS (Pin G5): The BIAS pin connects to the internal power bus. Connect to a power source greater than 2.4V. If the output is greater than 2.4V, connect this pin there. If the output voltage is less, connect this to a voltage source between 2.4V and 16V. Also, make sure that BIAS + V_{IN} is less than 56V.

RUN/SS (Pin H5): Tie RUN/SS pin to ground to shut down the LTM8022. Tie to 2.5V or more for normal operation. If the shutdown feature is not used, tie this pin to the V_{IN} pin. RUN/SS also provides a soft-start function; see the Applications Information section.

GND (Bank 3): Tie these GND pins to a local ground plane below the LTM8022 and the circuit components. Return the feedback divider (R_{ADJ}) to this pin.

R_T (Pin G7): The R_T pin is used to program the switching frequency of the LTM8022 by connecting a resistor from this pin to ground. The Applications Information section of the data sheet includes a table to determine the resistance value based on the desired switching frequency. Minimize capacitance at this pin.

SHARE (Pin F7): Tie this to the SHARE pin of another LTM8022 when paralleling the outputs. Otherwise, leave this pin floating.

SYNC (Pin G6): External Clock Synchronization Input. Ground this pin for low ripple Burst Mode[®] operation at low output loads, or connect to a stable voltage source above 0.7V to disable Burst Mode operation. **Do not leave this pin floating.** Tie to a clock source for synchronization. Clock edges should have rise and fall times faster than 1μs. See Synchronization in the Applications Information section.

PG (Pin H6): Open Collector Output of an Internal Comparator. PG remains low until the ADJ pin is within 10% of the final regulation voltage. PG output is valid when V_{IN} is above 3.6V and RUN/SS is high. If this function is not used, leave this pin floating.

ADJ (Pin H7): The LTM8022 regulates its ADJ pin to 0.79V. Connect the adjust resistor from this pin to ground. The value of R_{ADJ} is given by the equation, $R_{ADJ} = 394.21 / (V_{OUT} - 0.79)$, where R_{ADJ} is in kΩ.

*Running voltage range. Please refer to Applications Information for start-up details.

APPLICATIONS INFORMATION

For most applications, the design process is straight forward, summarized as follows:

1. In Table 1, find the row that has the desired input voltage range and output voltage.
2. Apply the recommended C_{IN} , C_{OUT} , R_{ADJ} and R_T values.
3. Connect BIAS as indicated.

While these component combinations have been tested for proper operation, it is incumbent upon the user to verify proper operation over the intended system's line, load and environmental conditions.

If the desired output voltage is not listed in Table 1, set the output by applying an R_{ADJ} resistor whose value is given by the equation $R_{ADJ} = 394.21/(V_{OUT} - 0.79)$, where R_{ADJ} is in $k\Omega$ and V_{OUT} is in volts. Verify the LTM8022's operation over the system's intended line, load and environmental conditions.

Capacitor Selection Considerations

The C_{IN} and C_{OUT} capacitor values in Table 1 are the minimum recommended values for the associated operating conditions. Applying capacitor values below those indicated in Table 1 is not recommended, and may result in undesirable operation. Using larger values is generally acceptable, and can yield improved dynamic response, if it is necessary. Again, it is incumbent upon the user to verify proper operation over the intended system's line, load and environmental conditions.

Ceramic capacitors are small, robust and have very low ESR. However, not all ceramic capacitors are suitable. X5R and X7R types are stable over temperature and applied voltage and give dependable service. Other types, including Y5V and Z5U, have very large temperature and voltage coefficients of capacitance. In an application circuit they may have only a small fraction of their nominal capacitance, resulting in much higher output voltage ripple than expected.

Ceramic capacitors are also piezoelectric. In Burst Mode operation, the LTM8022's switching frequency depends on the load current, and can excite a ceramic capacitor at audio frequencies, generating audible noise. Since the LTM8022 operates at a lower current limit during Burst

Mode operation, the noise is typically very quiet to a casual ear.

If this audible noise is unacceptable, use a high performance electrolytic capacitor at the output. The input capacitor can be a parallel combination of a $2.2\mu F$ ceramic capacitor and a low cost electrolytic capacitor.

A final precaution regarding ceramic capacitors concerns the maximum input voltage rating of the LTM8022. A ceramic input capacitor combined with trace or cable inductance forms a high Q (under damped) tank circuit. If the LTM8022 circuit is plugged into a live supply, the input voltage can ring to twice its nominal value, possibly exceeding the device's rating. This situation is easily avoided; see the Hot-Plugging Safely section.

Frequency Selection

The LTM8022 uses a constant-frequency PWM architecture that can be programmed to switch from 200kHz to 2.4MHz by using a resistor tied from the R_T pin to ground. Table 2 provides a list of R_T resistor values and their resultant frequencies.

Table 2. Switching Frequency vs R_T Value

| SWITCHING FREQUENCY (MHz) | R_T VALUE ($k\Omega$) |
|---------------------------|---------------------------|
| 0.2 | 187 |
| 0.3 | 121 |
| 0.4 | 88.7 |
| 0.5 | 68.1 |
| 0.6 | 56.2 |
| 0.7 | 46.4 |
| 0.8 | 40.2 |
| 0.9 | 34 |
| 1.0 | 29.4 |
| 1.2 | 23.7 |
| 1.4 | 19.1 |
| 1.6 | 16.2 |
| 1.8 | 13.3 |
| 2.0 | 11.5 |
| 2.2 | 9.76 |
| 2.4 | 8.66 |

Operating Frequency Tradeoffs

It is recommended that the user apply the optimal R_T value given in Table 1 for the input and output operating condition. System level or other considerations, however, may necessitate another operating frequency. While the LTM8022 is flexible enough to accommodate a wide range

APPLICATIONS INFORMATION

of operating frequencies, a haphazardly chosen one may result in undesirable operation under certain operating or fault conditions. A frequency that is too high can reduce efficiency, generate excessive heat or even damage the LTM8022 if the output is overloaded or short-circuited. A frequency that is too low can result in a final design that has too much output ripple or too large of an output cap.

The maximum frequency and corresponding R_T value at which the LTM8022 should be allowed to switch is given in Table 1 in the $R_{T(MIN)}$ and f_{MAX} columns, while the recommended frequency and R_T value over the given input range is given in the $R_{T(OPTIMAL)}$ and $f_{OPTIMAL}$ columns.

There are additional conditions that must be satisfied if the synchronization function is used. Please refer to the Synchronization section for details.

Burst Mode Operation

To enhance efficiency at light loads, the LTM8022 automatically switches to Burst Mode operation which keeps the output capacitor charged to the proper voltage while minimizing the input quiescent current. During Burst Mode operation, the LTM8022 delivers single cycle bursts of current to the output capacitor followed by sleep periods where the output power is delivered to the load by the output capacitor. In addition, V_{IN} and BIAS quiescent currents are reduced to typically $20\mu A$ and $50\mu A$, respectively, during the sleep time. As the load current decreases towards a no load condition, the percentage of time that the LTM8022 operates in sleep mode increases and the average input current is greatly reduced, resulting in higher efficiency.

Burst Mode operation is enabled by tying SYNC to GND. To disable Burst Mode operation, tie SYNC to a stable voltage source above 0.7V. **Do not leave this pin floating.**

BIAS Pin Considerations

The BIAS pin is used to provide drive power for the internal power switching stage and operate internal circuitry. For proper operation, it must be powered by at least 2.4V. If the output voltage is programmed to be 2.4V or higher, simply tie BIAS to AUX, which is internally tied to V_{OUT} . If V_{OUT} is less than 2.4V, BIAS can be tied to V_{IN} or some other voltage source. In all cases, ensure that the

maximum voltage at the BIAS pin is less than 16V and the sum of $V_{IN} + BIAS$ is less than 56V. If BIAS power is applied from a remote or noisy voltage source, it may be necessary to apply a decoupling capacitor locally to the LTM8022.

Minimum Input Voltage

The LTM8022 is a step-down converter, so a minimum amount of headroom is required to keep the output in regulation. For most applications at full load, the input needs to be at least 1.5V above the desired output. In addition, the input voltage required to turn on depends upon how the RUN/SS pin is tied. As shown in Figure 1, it takes more input voltage to turn on if RUN/SS is tied to V_{IN} than if the turn-on is controlled by raising RUN/SS when V_{IN} is in the required operating range. This is shown in Figure 1.

APPLICATIONS INFORMATION

Load Sharing

Two or more LTM8022's may be paralleled to produce higher currents. To do this, tie the V_{IN} , V_{OUT} and SHARE pins of all the paralleled LTM8022's together. Synchronize the LTM8022s to avoid beat frequencies if required. To ensure that paralleled modules start up together, the RUN/SS pins may be tied together, as well. If the RUN/SS pins are not tied together, make sure that the same valued soft-start capacitors are used for each module. An example of two LTM8022 modules configured for load sharing is given in the Typical Applications section.

Soft-Start

The RUN/SS pin can be used to soft-start the LTM8022, reducing the maximum input current during start-up. The RUN/SS pin is driven through an external RC filter to create a voltage ramp at this pin. Figure 2 shows the start-up and shutdown waveforms with the soft-start circuit. By choosing an appropriate RC time constant, the peak start-up current can be reduced to the current that is required to regulate the output, with no overshoot. Choose the value of the resistor so that it can supply at least $20\mu\text{A}$ when the RUN/SS pin reaches 2.5V.

Synchronization

The internal oscillator of the LTM8022 can be synchronized by applying an external 250kHz to 2MHz clock signal to the SYNC pin. The resistor tied from the R_T pin to ground

Figure 2. To Soft-Start the LTM8022, Add a Resistor and Capacitor to the RUN/SS Pin

should be chosen such that the LTM8022 would free run 20% lower than the intended synchronization frequency (see Frequency Selection section).

When the LTM8022 is synchronized to an external clock source, Burst Mode operation is disabled. The part will skip power switching cycles as necessary to maintain regulation. Ensure that the SYNC pin is not left floating. Tie it to GND if not used.

Shorted Input Protection

Care needs to be taken in systems where the output will be held high when the input to the LTM8022 is absent. This may occur in battery charging applications, or in battery backup systems where a battery or some other supply is diode ORed with the LTM8022's output. If the V_{IN} pin is allowed to float, and the RUN/SS pin is held high (either by a logic signal or because it is tied to V_{IN}), then the LTM8022's internal circuitry will pull its quiescent current through its internal power switch. This is fine if your system can tolerate a few milliamps in this state. If you ground the RUN/SS pin, the internal switch current will drop to essentially zero. However, if the V_{IN} pin is grounded while the output is held high, then parasitic diodes inside the LTM8022 can pull large currents from the output through the V_{IN} pin. Figure 3 shows a circuit that will run only when the input voltage is present and that protects against a shorted or reversed input.

Figure 3. The Input Diode Prevents a Shorted Input from Discharging a Back-Up Battery Tied to the Output. It Also Protects the Circuit From a Reversed Input. The LTM8022 Runs Only When the Input is Present

APPLICATIONS INFORMATION

PCB Layout

Most of the headaches associated with PCB layout have been alleviated or even eliminated by the high level of integration of the LTM8022. The LTM8022 is nevertheless a switching power supply, and care must be taken to minimize EMI and ensure proper operation. Even with the high level of integration, you may fail to achieve specified operation with a haphazard or poor layout. See Figure 4 for a suggested layout.

Ensure that the grounding and heatsinking are acceptable. A few rules to keep in mind are:

1. Place the R_{ADJ} and R_T resistors as close to their respective pins as possible.
2. Place the C_{IN} capacitor as close as possible to the V_{IN} and GND connection of the LTM8022.
3. Place the C_{OUT} capacitor as close as possible to the V_{OUT} and GND connection of the LTM8022.
4. Place the C_{IN} and C_{OUT} capacitors such that their ground current flow directly adjacent or underneath the LTM8022.
5. Connect all of the GND connections to as large a copper pour or plane area as possible on the top layer. Avoid breaking the ground connection between the external components and the LTM8022.
6. Use vias to connect the GND copper area to the boards internal ground plane. Liberally distribute these GND vias to provide both a good ground connection and thermal path to the internal planes of the printed circuit board.

APPLICATIONS INFORMATION

Hot-Plugging Safely

The small size, robustness and low impedance of ceramic capacitors make them an attractive option for the input bypass capacitor of LTM8022. However, these capacitors can cause problems if the LTM8022 is plugged into a live supply (see Linear Technology Application Note 88 for a complete discussion). The low loss ceramic capacitor combined with stray inductance, in series with the power source, forms an underdamped tank circuit. In this case, the voltage at the V_{IN} pin of the LTM8022 can ring to twice the nominal input voltage, possibly exceeding the LTM8022's rating and damaging the part. If the input supply is poorly controlled or the user will be plugging the LTM8022 into an energized supply, the input network should be designed to prevent this overshoot. Figure 5 shows the waveforms that result when an LTM8022 circuit is connected to a 24V supply through six feet of 24-gauge twisted pair. The first plot is the response with a 2.2 μ F ceramic capacitor at the input. The input voltage rings as high as 35V and the input current peaks at 20A. One method of damping the tank circuit is to add another capacitor with a series resistor to the circuit. In Figure 5b an aluminum electrolytic capacitor has been added. This capacitor's high equivalent series resistance damps the circuit and eliminates the voltage overshoot. The extra capacitor improves low frequency ripple filtering and can slightly improve the efficiency of the circuit, though it is likely to be the largest component in the circuit. An alternative solution is shown in Figure 5c. A 0.7 Ω resistor is added in series with the input to eliminate the voltage overshoot (it also reduces the peak input current). A 0.1 μ F capacitor improves high frequency filtering. This solution is smaller and less expensive than the electrolytic capacitor. For high input voltages its impact on efficiency is minor, reducing efficiency less than one half percent for a 5V output at full load operating from 24V.

Thermal Considerations

The LTM8022 output current may need to be derated if it is required to operate in a high ambient temperature or deliver a large amount of power. The amount of current derating is dependent upon the input voltage, output power and ambient temperature. The derating curves in the Typical Performance Characteristics section can be used as a guide. These curves were generated by an LTM8022 mounted to a 33cm² 4-layer FR4 printed circuit board. Boards of other sizes and layer count can exhibit different thermal behavior, so it is incumbent upon the user to verify proper operation over the intended system's line, load and environmental operating conditions.

The junction to air and junction to board thermal resistances given in the Pin Configuration diagram may also be used to estimate the LTM8022 internal temperature. These thermal coefficients are determined per JEDEC 51-9 (JEDEC standard, test boards for area array surface mount package thermal measurements) through analysis and physical correlation. Bear in mind that the actual thermal resistance of the LTM8022 to the printed circuit board depends upon the design of the circuit board. The die temperature of the LTM8022 must be lower than the maximum rating of 125°C, so care should be taken in the layout of the circuit to ensure good heat sinking of the LTM8022.

The bulk of the heat flow out of the LTM8022 is through the bottom of the module and the LGA pads into the printed circuit board. Consequently a poor printed circuit board design can cause excessive heating, resulting in impaired performance or reliability. Please refer to the PCB Layout section for printed circuit board design suggestions.

Finally, be aware that at high ambient temperatures the internal Schottky diode will have significant leakage current (see Typical Performance Characteristics) increasing the quiescent current of the LTM8022.
