

PIC16F18446 Curiosity Nano

PIC16F18446 Curiosity Nano Hardware User Guide

Preface

The PIC16F18446 Curiosity Nano evaluation kit is a hardware platform to evaluate the PIC16F18446 microcontroller (MCU).

Supported by the MPLAB® X Integrated Development Environment (IDE), the kit provides easy access to the features of the PIC16F18446 and explains how to integrate the device into a custom design.

The Curiosity Nano series of evaluation kits include an on-board debugger, and no external tools are necessary to program the PIC16F18446.

1. Introduction

1.1 Features

- PIC16F18446-I/GZ Microcontroller
- One Yellow User LED
- One Mechanical User Switch
- One 32.768 kHz Crystal
- On-Board Debugger
 - Board identification in MPLAB X IDE
 - One green power and status LED
 - Programming and debugging
 - Virtual COM port (CDC)
 - One logic analyzer channel (DGI GPIO)
- USB Powered
- Adjustable Target Voltage
 - MIC5353 LDO regulator controlled by the on-board debugger
 - 2.3 - 5.1 V output voltage (limited by USB input voltage)
 - 500 mA maximum output current (limited by ambient temperature and output voltage)

1.2 Kit Overview

The PIC16F18446 Curiosity Nano evaluation kit is a hardware platform to evaluate the PIC16F18446.

Figure 1-1. PIC16F18446 Curiosity Nano Evaluation Kit Overview

2. Getting Started

2.1 Curiosity Nano Quick Start MPLAB® Xpress

Steps to start exploring the Curiosity Nano platform with MPLAB Xpress:

1. Go to <https://mplabxpress.microchip.com>, and open MPLAB Xpress.
2. Create a new standalone project for PIC16F18446.
3. Use the MPLAB Xpress Code Configurator, or write your own code.
4. Compile and download your application HEX file.
5. Connect a USB cable (Standard-A to Micro-B or Micro-AB) between the PC and the debug USB port on the kit.
6. Copy the application HEX file into the *CURIOSITY* mass storage drive to program the application into the PIC16F18446.

To use advanced debug features of the Curiosity Nano kit, package the MPLAB Xpress project for MPLAB X, and follow the quick start guide in the next section.

2.2 Curiosity Nano Quick Start

Steps to start exploring the Curiosity Nano platform:

1. Download MPLAB X IDE.
2. Launch MPLAB X IDE.
3. Connect a USB cable (Standard-A to Micro-B or Micro-AB) between the PC and the debug USB port on the kit.

When the Curiosity Nano kit is connected to your computer for the first time, the operating system will perform a driver software installation. The driver file supports both 32- and 64-bit versions of Microsoft® Windows® XP, Windows Vista®, Windows 7, Windows 8, and Windows 10. The drivers for the kit are included with MPLAB X IDE.

Once the Curiosity Nano board is powered the green status LED will be lit and MPLAB X IDE will auto-detect which Curiosity Nano board is connected. MPLAB X IDE will present relevant information like data sheets and kit documentation. The PIC16F18446 device is programmed and debugged by the on-board debugger and therefore no external programmer or debugger tool is required.

2.3 Design Documentation and Relevant Links

The following list contains links to the most relevant documents and software for the PIC16F18446 Curiosity Nano.

- **MPLAB® X IDE** - MPLAB® X IDE is a software program that runs on a PC (Windows®, Mac OS®, Linux®) to develop applications for Microchip microcontrollers and digital signal controllers. It is called an Integrated Development Environment (IDE) because it provides a single integrated "environment" to develop code for embedded microcontrollers.
- **MPLAB® Xpress Cloud-based IDE** - MPLAB® Xpress Cloud-Based IDE is an online development environment that contains the most popular features of our award-winning MPLAB X IDE. This simplified and distilled application is a faithful reproduction of our desktop-based program, which allows users to easily transition between the two environments.

PIC16F18446 Curiosity Nano

Getting Started

- [MPLAB® Code Configurator](#) - MPLAB® Code Configurator (MCC) is a free software plug-in that provides a graphical interface to configure peripherals and functions specific to your application.
- [Microchip Sample Store](#) - Microchip sample store where you can order samples of devices.
- [Data Visualizer](#) - Data Visualizer is a program used for processing and visualizing data. The Data Visualizer can receive data from various sources such as the EDBG Data Gateway Interface found on Curiosity Nano and Xplained Pro boards and COM Ports.
- [PIC16F18446 Curiosity Nano website](#) - Kit information, latest user guide and design documentation.
- [PIC16F18446 Curiosity Nano on microchipDIRECT](#) - Purchase this kit on microchipDIRECT.

3. Curiosity Nano

Curiosity Nano is an evaluation platform that provides a set of small boards with access to most of the microcontrollers I/Os. The platform consists of a series of low pin-count microcontroller (MCU) boards, which are integrated with MPLAB X IDE to present relevant user guides, application notes, data sheets, and example code. The platform features a Virtual COM port (CDC) for serial communication to a host PC and a Data Gateway Interface (DGI) GPIO.

3.1 On-Board Debugger

PIC16F18446 Curiosity Nano contains an onboard debugger for programming and debugging. The on-board debugger is a composite USB device of several interfaces: a debugger, a mass storage device, a data gateway, and a Virtual COM port (CDC).

Together with MPLAB X IDE, the on-board debugger interface can program and debug the PIC16F18446.

A Data Gateway Interface (DGI) is available for use with the logic analyzer channels for code instrumentation, to visualize program flow. DGI GPIOs can be graphed using the [Data Visualizer](#).

The Virtual COM port is connected to a UART on the PIC16F18446 and provides an easy way to communicate with the target application through terminal software.

The on-board debugger controls one Power and Status LED (marked PS) on the PIC16F18446 Curiosity Nano board. The table below shows how the LED is controlled in different operation modes.

Table 3-1. On-board Debugger LED Control

Operation Mode	Status LED
Boot Loader mode	LED blink at 1 Hz during power up.
Power-up	LED is lit - constant.
Normal operation	LED is lit - constant.
Programming	Activity indicator; the LED flashes slowly during programming/debugging.
Fault	The LED flashes fast if a power fault is detected.
Sleep/Off	LED is off. The on-board debugger is either in Sleep mode or powered down. This can occur if the kit is externally powered.

3.1.1 Virtual COM Port

A general purpose USB serial bridge between a host PC and a target device.

3.1.1.1 Overview

The debugger implements a composite USB device that includes a standard Communications Device Class (CDC) interface, which appears on the host as a Virtual COM Port. The CDC can be used to stream arbitrary data in both directions between the host and the target: characters sent from the host will appear in UART form on the CDC TX pin, and UART characters sent into the CDC RX pin will be sent back to the host.

On Windows machines, the CDC will enumerate as Curiosity Virtual COM Port and appear in the Ports section of the device manager. The COM port number is usually shown here.

Info: On older Windows systems a USB driver is required for CDC. This driver is included in Atmel[®] Studio and MPLAB X installations.

On Linux machines, the CDC will enumerate and appear as `/dev/ttyACM#`.

On MAC machines, the CDC will enumerate and appear as `/dev/tty.usbmodem#`. Depending on which terminal program is used, it will appear in the available list of modems as `usbmodem#`.

3.1.1.2 Limitations

Not all UART features are implemented in the debugger CDC. The constraints are outlined here:

- **Baud rate** must be in the range 1200 bps to 500 kbps. Values outside this range will be capped to these values, without warning. Baud rate can be changed on-the-fly.
- **Character format:** only 8-bit characters are supported.
- **Parity:** can be odd, even, or none.
- **Hardware flow control:** not supported.
- **Stop bits:** one or two bits are supported.

3.1.1.3 Signaling

During USB **enumeration**, the host OS will start both communication and data pipes of the CDC interface. At this point, it is possible to set and read back baud rate and other UART parameters of the CDC, but data sending and receiving will not be enabled.

When a terminal connects on the host, it must assert the **DTR signal**. This is a virtual control signal that is implemented on the USB interface but not in hardware on the debugger. Asserting DTR from the host will indicate to the debugger that a CDC session is active, and it will enable its level shifters (if available), and start the CDC data send and receive mechanisms.

Deasserting the **DTR signal** will *not* disable the level shifters, but it will disable the receiver, so no further data will be streamed to the host. Data packets that are already queued up for sending to the target will continue to be sent out, but no further data will be accepted.

3.1.1.4 Advanced Use

CDC Override Mode

In normal operation, the on-board debugger is a true UART bridge between the host and the device. However, under certain use cases, the debugger can override the Basic Operating mode and use the CDC pins for other purposes.

Dropping a text file (with extension `.txt`) into the debugger's mass storage drive can be used to send characters out of the CDC TX pin. The text file must start with the characters:

```
CMD:SEND_UART=
```

The maximum message length is 50 characters - all remaining data in the frame is ignored.

The default baud rate used in this mode is 9600 bps, but if the CDC is already active or has been configured, the baud rate last used still applies.

USB-Level Framing Considerations

Sending data from the host to the CDC can be done byte-wise or in blocks, which will be chunked into 64-byte USB frames. Each such frame will be queued up for sending to the CDC TX pin. Sending a small amount of data per frame can be inefficient, particularly at low baud rates, since the debugger buffers frames, not bytes. A maximum of 4 x 64-byte frames can be active at any time, the debugger will throttle the incoming frames accordingly. Sending full 64-byte frames containing data is the most efficient.

When **receiving data** from the target, the debugger will queue up incoming bytes into 64-byte frames, which are sent to the USB queue for transmission to the host when they are full. Incomplete frames are also pushed to the USB queue at approximately 100 ms intervals, triggered by USB start-of-frame tokens. Up to 8 x 64-byte frames can be active at any time. If the host, or software running on it, fails to receive data fast enough, an overrun will occur. When this happens the last-filled buffer frame will be recycled instead of being sent to the USB queue, and a full frame of data will be lost. To prevent this occurrence, the user must ensure that the CDC data pipe is being read continuously, or the incoming data rate must be reduced.

3.1.2 Mass Storage Disk

A simple way to program the target device is through drag and drop with *.hex*-files.

3.1.2.1 Mass Storage Device

The debugger implements a highly optimized variant of the FAT12 file system that has a number of limitations, partly due to the nature of FAT12 itself, and partly due to optimizations made to fulfill its purpose in this development kit.

The CURIOSITY drive *is* USB Chapter 9 compliant as a mass storage device but does not in any way fulfill the expectations of a general purpose mass storage device. This behavior is intentional.

The debugger enumerates as a Curiosity Nano USB device that can be found in the disk drives section of the Windows device manager. The CURIOSITY drive appears in the file manager and claims the next available drive letter in the system.

The CURIOSITY drive contains approximately 1 MB of free space. This does *not* reflect the size of the target device's Flash in any way. When programming a hex file, the binary data is encoded in ASCII with metadata providing a large overhead, so 1 MB is a trivially chosen value for disk size.

It is *not* possible to format the CURIOSITY drive. When programming a file to the target, the filename may appear in the disk directory listing - this is merely the operating system's view of the directory, which, in reality, has not been updated. It is not possible to read out the file contents. Removing and replugging the kit will return the file system to its original state, but the target will still contain the application that has been previously programmed.

To erase the target device, simply copy a text file starting with "CMD:ERASE" onto the disk.

By default the CURIOSITY drive contains several read-only files for generating icons as well as reporting status and linking to further information:

- AUTORUN.ICO - Icon file for the Microchip logo.
- AUTORUN.INF - System file required for Windows Explorer to show the icon file.
- KIT-INFO.HTM - Redirect to the development board web site.
- KIT-INFO.TXT - A text file containing details about the kit firmware, name, serial number, and device.
- STATUS.TXT - A text file containing the programming status of the board.

Info: When STATUS.TXT is updated by the debugger dynamically, the contents may be cached by the OS and not reflect the correct status.

3.1.2.2 Configuration Words/Fuse Bytes

Configuration Words (PIC® MCU Targets)

Configuration Word settings included in the project being programmed after program Flash is programmed. The debugger will *not* mask out any bits in the Configuration Words when writing them, but since it uses Low-Voltage Programming mode, it is unable to clear the LVP Configuration bit. If the incorrect clock source is selected, for example, and the board does not boot, it is always possible to perform a bulk erase (always done before programming) and restore the device to its default settings.

3.2 Curiosity Nano Standard Pinout

The twelve edge connections closest to the USB connector on Curiosity Nano kits have a standardized pinout. The program/debug pins have different functions depending on the target programming interface as shown in the table and figure below.

Table 3-2. Curiosity Nano Standard Pinout

Debugger Signal	ICSP Target	Description
ID	-	ID line for extensions.
CDC TX	UART RX	USB CDC TX line.
CDC RX	UART TX	USB CDC RX line.
DBG0	ICSPDAT	Debug data line.
DBG1	ICSPCLK	Debug clock line/DGI GPIO
DBG2	GPIO0	DGI GPIO
DBG3	MCLR	Reset line.
NC	-	No connect.
VBUS	-	VBUS voltage for external use.
VOFF	-	Voltage Off input.
VTG	-	Target voltage.
GND	-	Common ground.

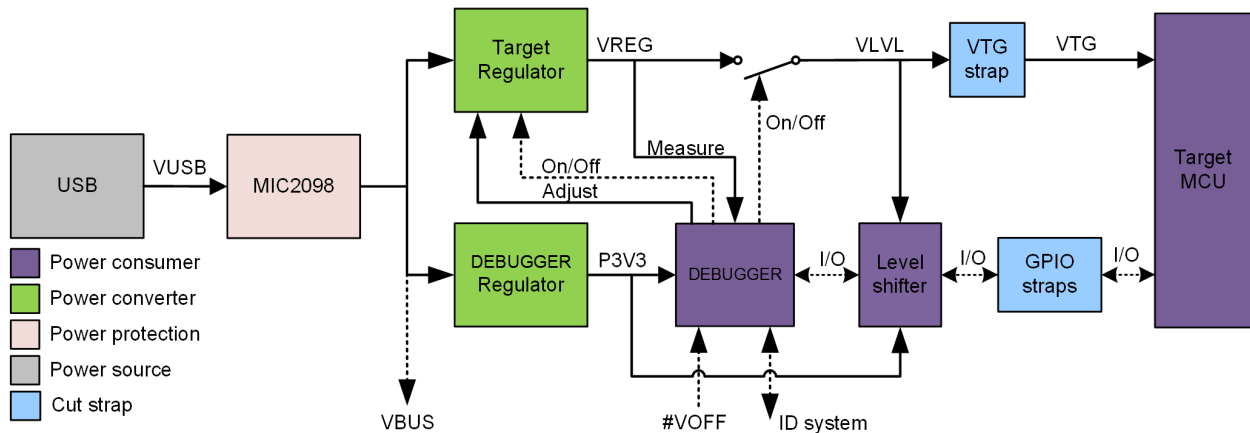

Figure 3-1. Curiosity Nano Standard Pinout

3.3 Power Supply

The kit is powered through the USB port and contains two regulators for generating 3.3V for the debugger and an adjustable regulator for the target. The voltage from the USB connector can vary between 4.4V to 5.25V (according to the USB specification) and will limit the maximum voltage to the target. The figure below shows the entire power supply system on PIC16F18446 Curiosity Nano.

Figure 3-2. Power Supply Block Diagram

3.3.1 Target Regulator

The target voltage regulator is a MIC5353 variable output LDO. The on-board debugger can adjust the voltage output that is supplied to the kit target section by manipulating the MIC5353's feedback voltage. The hardware implementation is limited to an approximate voltage range from 1.7V to 5.1V. Additional output voltage limits are configured in the debugger firmware to ensure that the output voltage never exceeds the hardware limits of the PIC16F18446 microcontroller. The voltage limits configured in the on-board debugger on PIC16F18446 Curiosity Nano are 2.3 - 5.1 V.

The target voltage is set to 3.3V in production and can be changed through Atmel Studio. Any change to the target voltage done in Atmel Studio is persistent, even through a power toggle.

The MIC5353 supports a maximum current load of 500 mA. It is an LDO regulator in a small package, placed on a small PCB, and the thermal shutdown condition can be reached at lower loads than 500 mA. The maximum current load depends on the input voltage, set output voltage, and the ambient temperature. The figure below shows the safe operation area for the regulator, with an input voltage of 5.1V and an ambient temperature of 23°C.

Figure 3-3. Target Regulator Safe Operation Area

3.3.2 External Supply

PIC16F18446 Curiosity Nano can be powered by an external voltage instead of the on-board target regulator. When the Voltage Off (*VOFF*) pin is shorted to ground (*GND*) the on-board debugger firmware disables the target regulator and it is safe to apply an external voltage to the VTG pin.

Applying an external voltage to the VTG pin without shorting *VOFF* to *GND* may cause permanent damage to the kit.

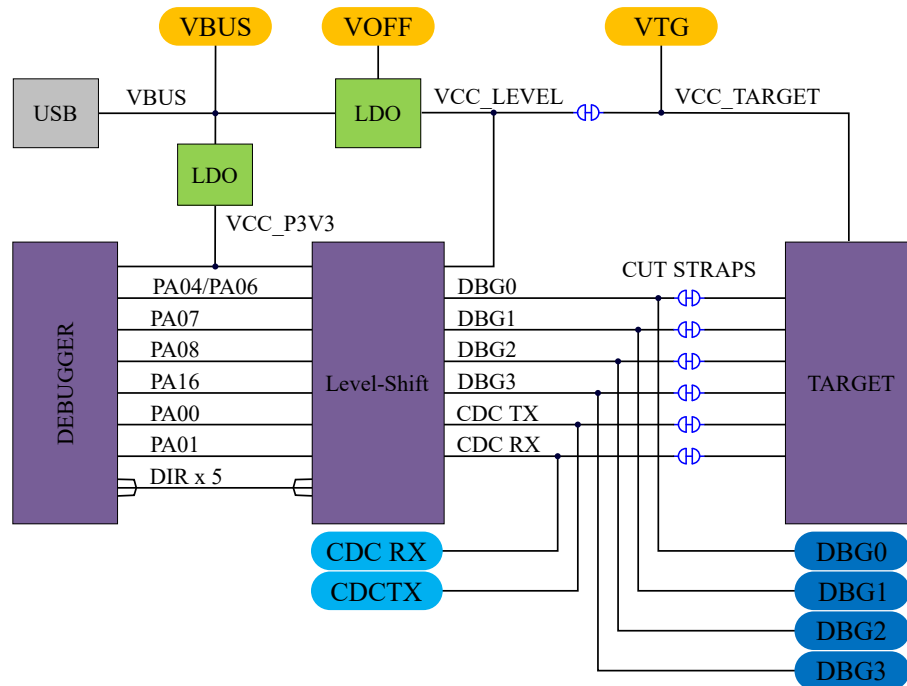

Absolute maximum external voltage is 5.5V for the level shifters on board. Applying a higher voltage may cause permanent damage to the kit.

Programming, debugging, and data streaming is still possible while using external power: the debugger and signal level shifters will be powered from the USB cable. Both regulators, the debugger, and the level shifters are powered down when the USB cable is removed.

3.4 Disconnecting the On-Board Debugger

The block diagram below shows all connections between the debugger and the PIC16F18446 microcontroller. The rounded boxes represent connections to the board edge on PIC16F18446 Curiosity Nano. The signal names are shown in [Figure 3-1](#) and printed in silkscreen on the bottom side of the board.

Figure 3-4. On-board Debugger Connections to the PIC16F18446

By cutting the *GPIO straps* with a sharp tool, as shown in [Figure 3-5](#), all I/Os connected between the debugger and the PIC16F18446 are completely disconnected. To completely disconnect the target regulator, cut the VTG strap shown in [Figure 3-5](#).

Info: Cutting the connections to the debugger will disable programming, debugging, data streaming, and the target power supply. The signals will also be disconnected from the board edge next to the on-board debugger section.

Info: Solder in 0Ω resistors across the footprints or short-circuit them with tin solder to reconnect any cut signals.

Figure 3-5. Kit Modifications

3.5 Current Measurement

The power to the PIC16F18446 is connected from the on-board power supply to the target voltage supply (VTG) with a cut strap as shown in Section 3.4 [Disconnecting the On-Board Debugger](#). To measure the power consumption of the PIC16F18446 and other peripherals connected to the board, cut the strap and connect an ammeter over the strap. The ammeter can be connected between the target VTG pad edge connector and an external power supply for easy measurement. Alternatively, an external power supply can be used as described in Section 3.3.2 [External Supply](#).

Info: The on-board level shifters will draw a small amount of current even when they are not in use. A maximum of 10 μA can be drawn from the VTG net and an additional 2 μA can be drawn from each I/O pin connected to a level shifter for a total of 20 μA . Disconnect the on-board debugger and level shifters as described in Section 3.4 [Disconnecting the On-Board Debugger](#) to prevent any leakage.

4. Hardware User Guide

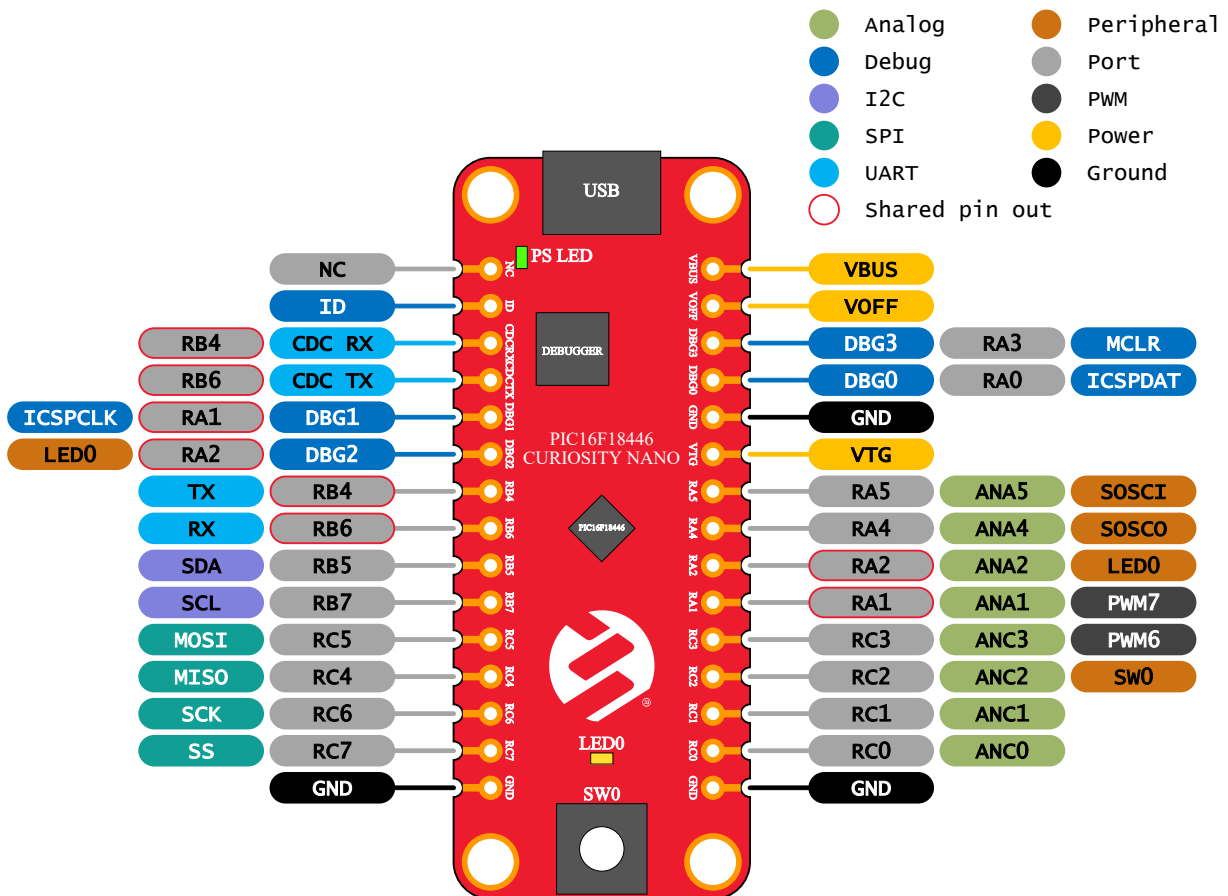

4.1 Connectors

4.1.1 PIC16F18446 Curiosity Nano Pinout

All of the PIC16F18446 I/O pins are accessible at the edge connectors on PIC16F18446 Curiosity Nano. The image below shows the kit pinout.

RA0 and RA3 are only available at the edge connector in the debugger section as long as the cut straps on the bottom are not cut.

Figure 4-1. PIC16F18446 Curiosity Nano Pinout

4.2 Peripherals

4.2.1 LED

There is one yellow user LED available on the PIC16F18446 Curiosity Nano kit that can be controlled with either GPIO or PWM. The LED can be activated by driving the connected I/O line to GND.

Table 4-1. LED Connection

PIC16F18446 Pin	Function	Shared Functionality
RA2	Yellow LED0	DBG2 and Edge connector

4.2.2 Mechanical Switch

PIC16F18446 Curiosity Nano has one mechanical switch. This is a generic user configurable switch and when the switch is pressed, it will drive the I/O line to ground (GND).

Info: There is no pull-up resistor connected to the generic user switch. Remember to enable the internal pull-up in the PIC16F18446 to use the switch.

Table 4-2. Mechanical Switch

PIC16F18446 Pin	Description	Shared Functionality
RC2	User switch (SW0)	Edge connector

4.2.3 Crystal

The PIC16F18446 Curiosity Nano board has a 32.768 kHz crystal mounted.

The crystal is not connected to the PIC16F18446 by default, as the GPIO's are routed out to the edge connector. To use the crystal, some hardware modifications are required. The two I/O lines routed to the edge connector should be disconnected to reduce the chance of contention to the crystal, and to remove excessive capacitance on the lines. This can be done by cutting the two straps on the bottom side of the board, marked RA4 and RA5 as shown in the figure below. Next, solder on a solder blob on each of the circular solder points next to the crystal on the top side of the board as shown in the figure below.

The 32.768 kHz crystal on PIC16F18446 Curiosity Nano is a Kyocera Corporation ST3215SB32768C0HPWBB 7 pF crystal.

The crystal has been formally tested and matched to the PIC16F18446 by Kyocera. The test report is available in the design documentation distributed with this document for PIC16F18446 Curiosity Nano.

Info: Kyocera Crystal Device Corporation crystals that are matched with specific products can be found on their website: http://prdct-search.kyocera.co.jp/crystal-ic/?p=en_search/

Table 4-3. Crystal Connections

PIC16F18446 Pin	Function	Shared Functionality
RA4	SOSCO (Crystal output)	Edge connector
RA5	SOSCI (Crystal input)	Edge connector

Figure 4-2. Crystal Connection and Cut Straps

4.3 On-Board Debugger Implementation

PIC16F18446 Curiosity Nano features an on-board debugger that can be used to program and debug the PIC16F18446 using In-Circuit Serial Programming™ (ICSP™). The on-board debugger also includes a Virtual Com port interface over UART and DGI GPIO. MPLAB X IDE can be used as a front-end for the on-board debugger for programming and debugging. [Data Visualizer](#) can be used as a front-end for the CDC and DGI GPIO.

4.3.1 On-Board Debugger Connections

The table below show the connections between the target and the debugger section. All connections between the target and the debugger are tri-stated as long as the debugger is not actively using the interface, hence there is little contamination of the signals and the pins can be configured to the application requirements.

For further information on how to use the capabilities of the on-board debugger, see [3. Curiosity Nano](#).

Table 4-4. On-Board Debugger Connections

PIC16F18446 Pin	Debugger Pin	Function	Shared Functionality
RB6	CDC TX	UART RX (PIC16F18446 RX line)	Edge connector
RB4	CDC RX	UART TX (PIC16F18446 TX line)	Edge connector
RA0	DBG0	ICSP DAT	
RA1	DBG1	ICSP CLK	Edge connector
RA2	DBG2	GPIO	LED and Edge connector
RA3	DBG3	$\overline{\text{MCLR}}$	
VCC_TARGET	VCC_LEVEL	2.3 - 5.1 V Supply voltage	
GND	GND	Common ground	

5. Hardware Revision History

This user guide provides the latest available revision of the kit. This chapter contains information about known issues, a revision history of older revisions, and how older revisions differ from the latest revision.

5.1 Identifying Product ID and Revision

The revision and product identifier of Curiosity Nano boards can be found in two ways; either through MPLAB X IDE or by looking at the sticker on the bottom side of the PCB.

By connecting a Curiosity Nano board to a computer with MPLAB X IDE running, an information window will pop up. The first six digits of the serial number, which is listed under kit details, contain the product identifier and revision.

The same information can be found on the sticker on the bottom side of the PCB. Most kits will print the identifier and revision in plain text as A09-nnnn\rr, where nnnn is the identifier and rr is the revision. Boards with limited space have a sticker with only a QR-code, which contains a serial number string.

The serial number string has the following format:

```
"nnnnrrssssssss"  
n = product identifier  
r = revision  
s = serial number
```

The product identifier for PIC16F18446 Curiosity Nano is A09-3120.

5.2 Revision 5

Revision 5 is the initially released revision.

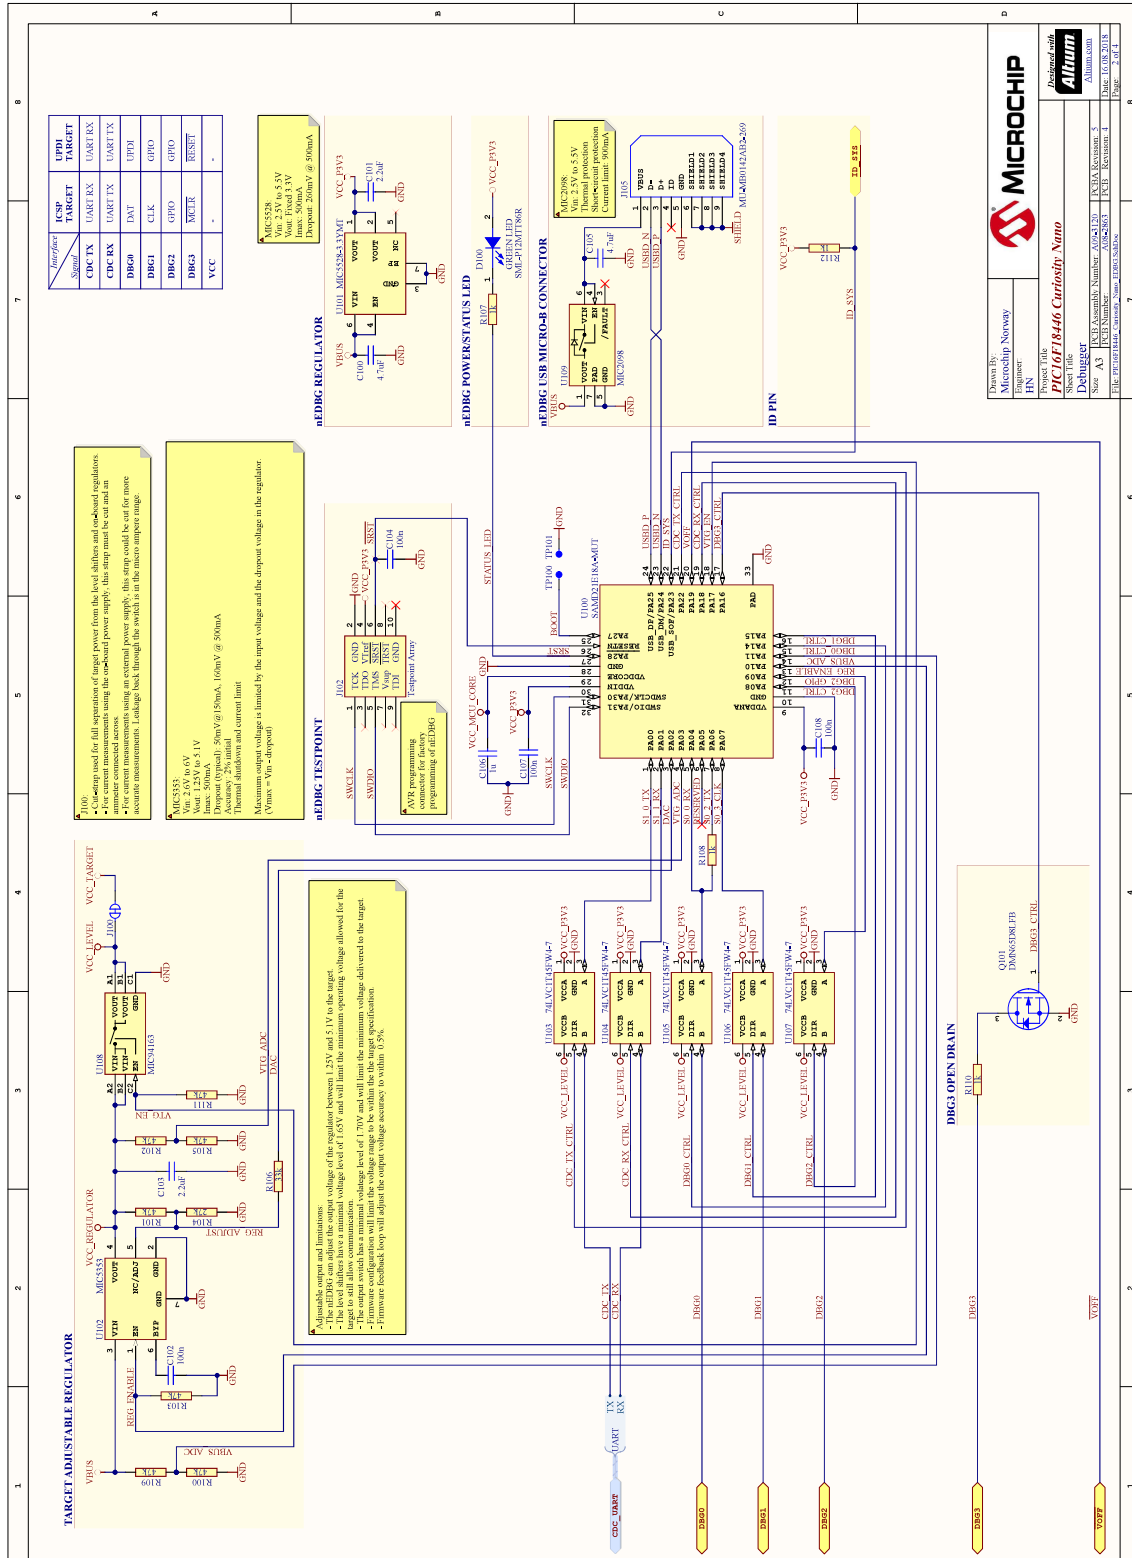

6. Document Revision History

Doc. rev.	Date	Comment
A	10/2018	Initial document release.

7. Appendix

7.1 Schematic

Figure 7-1. PIC16F18446 Curiosity Nano Schematic

PIC16F18446 Curiosity Nano

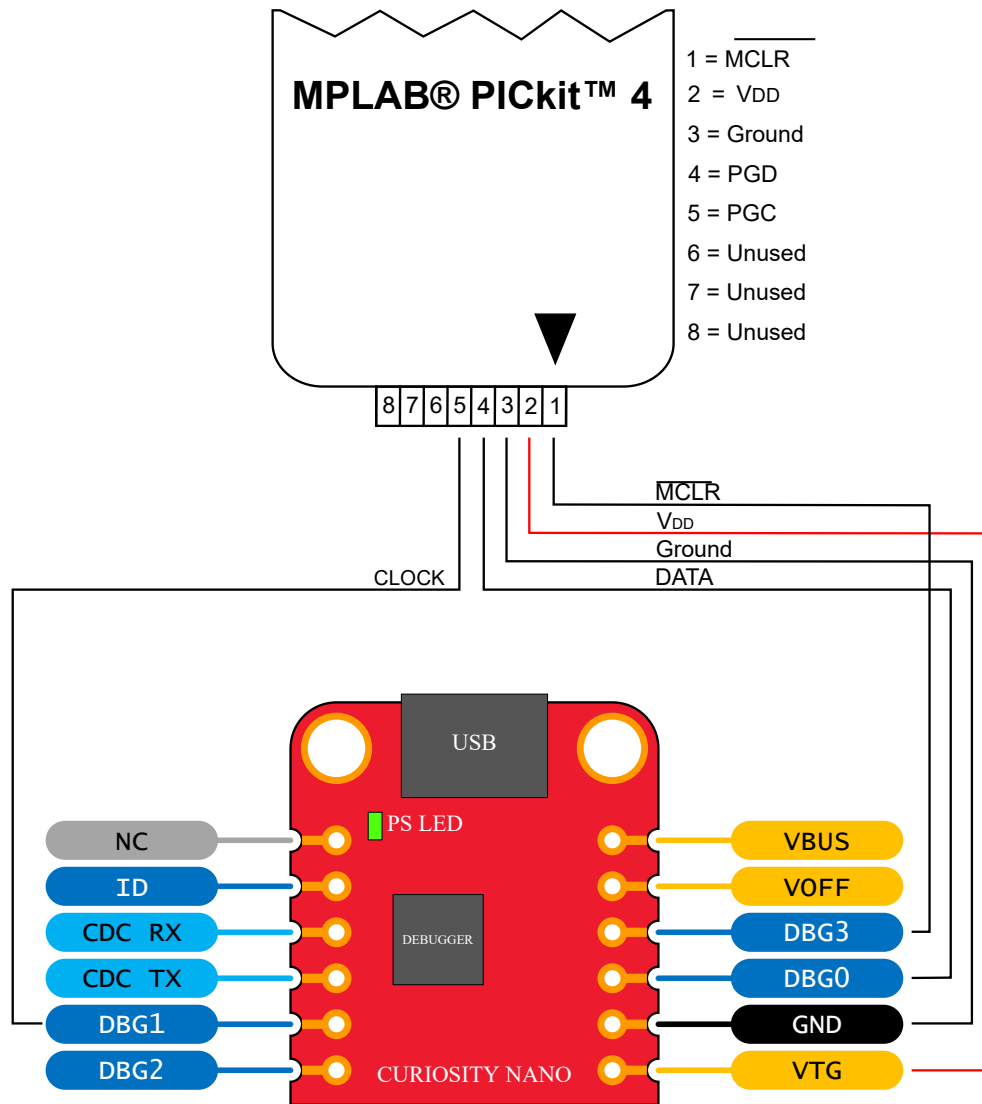

Appendix

7.2 Connecting External Debuggers

Even though there is an on-board debugger, external debuggers can be connected directly to PIC16F18446 Curiosity Nano to program/debug the PIC16F18446. The on-board debugger keeps all the pins connected to the PIC16F18446 and board edge in tri-state when not actively used. Therefore, the on-board debugger will not interfere with any external debug tools.

Figure 7-2. Connecting the MPLAB PICKit™ 4 In-circuit Debugger/Programmer to PIC16F18446 Curiosity Nano

To avoid contention between the external debugger and the on-board debugger, do not start any programming/debug operation with the on-board debugger through MPLAB X IDE or mass storage programming while the external tool is active.

The Microchip Web Site

Microchip provides online support via our web site at <http://www.microchip.com/>. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Customer Change Notification Service

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at <http://www.microchip.com/>. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://www.microchip.com/support>

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.

- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Trademarks

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, Klear, LANCheck, LINK MD, maXStylus, maXTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prochip Designer, QTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, INICnet, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, memBrain, Mindi, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICKit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

Quality Management System Certified by DNV

ISO/TS 16949

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC[®] MCUs and dsPIC[®] DSCs, KEELOQ[®] code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
