Description

The Si550 VCXO utilizes Skyworks Solutions' advanced DSPLL® circuitry to provide a low-jitter clock at high frequencies. The Si550 supports any frequency from 10 to 945 MHz and select frequencies to 1417 MHz. Unlike traditional VCXOs, where a different crystal is required for each output frequency, the Si550 uses one fixed crystal to provide a wide range of output frequencies. This IC-based approach allows the crystal resonator to provide exceptional frequency stability and reliability. In addition, DSPLL clock synthesis provides superior supply noise rejection, simplifying the task of generating low-jitter clocks in noisy environments typically found in communication systems. The Si550 IC-based VCXO is factory-configurable for a wide variety of user specifications, including frequency, supply voltage, output format, tuning slope, and temperature stability. Specific configurations are factory programmed at time of shipment, thereby eliminating the long lead times associated with custom oscillators.

3. Ordering Information

The Si550 supports a variety of options including frequency, temperature stability, tuning slope, output format, and V_{DD}. Specific device configurations are programmed into the Si550 at time of shipment. Configurations are specified using the Part Number Configuration chart shown below. Skyworks Solutions provides a web browser-based part number configuration utility to simplify this process. Refer to https://www.skyworksinc.com/en/Products/Timing to access this tool and for further ordering instructions. The Si550 VCXO series is available in an industry-standard, RoHS compliant, lead-free, 6-pad, 5 x 7 mm package. Tape and reel packaging is an ordering option.

Notes:
1. For best jitter and phase noise performance, always choose the smallest Kv that meets the application s minimum APR requirements. Unlike SAW-based solutions which require higher higher Kv values to account for their higher temperature dependence, the Si55x series provides lower Kv options to minimize noise coupling and jitter in real-world PLL designs. See AN255 and AN266 for more information.
2. APR is the ability of a VCXO to track a signal over the product lifetime A VCXO with an APR of ±25 ppm is able to lock to a clock with a ±25 ppm stability over 15 years over all operating conditions.
3. Nominal Pull range (±) = 0.5 x V_{DD} x tuning slope.
4. Nominal Absolute Pull Range (±APR) = Pull range – stability – lifetime aging
   = 0.5 x V_{DD} x tuning slope – stability – 10 ppm
5. Minimum APR values noted above include worst case values for all parameters.
6. Combination not available.

Example Part Number: 550AF622M080DGR is a 5 x 7 mm VCXO in a 6 pad package. The nominal frequency is 622.080 MHz, with a 3.3 V supply, LVPECL output, and Output Enable active high polarity. Temperature stability is specified as ±50 ppm and the tuning slope is 135 ppm/V. The part is specified for a –40 to +85 C° ambient temperature range operation and is shipped in tape and reel format.
