RICOH

0.5A/1A PWM/VFM Step-down DC/DC Converter with Synchronous Rectifier

OUTLINE

The RP519Z is a low supply current CMOS-based PWM/VFM step-down DC/DC converter with synchronous rectifier featuring 0.5 A / 1 A output current[1]. Internally, a single converter consists of a reference voltage unit, an error amplifier, a switching control circuit, a mode control circuit, a soft-start circuit, an under-voltage lockout (UVLO) circuit, a thermal shutdown circuit, and switching transistors. The RP519Z is employing synchronous rectification for improving the efficiency of rectification by replacing diodes with built-in switching transistors. Using synchronous rectification not only increases circuit performance but also allows a design to reduce parts count. Output voltage controlling method is selectable between a forced PWM control type and a PWM/VFM auto-switching control type, and can be set by the MODE pin. Output voltage type is selectable between an internally fixed output voltage type and an externally adjustable output voltage type. Protection circuits in the RP519Z is current limit circuit and thermal shutdown circuit. LX current limit value (Typ.) is selectable between 1.6 A and 1.0 A.

The RP519Z is available in WLCSP−6−P8 which achieves high-density mounting on boards. Using capacitor of 0402- / 1005-size (inch / mm) and inductor of 0603- /1608-size (inch / mm) as external parts help to save space for devices.

FEATURES

- Input Voltage Range (Maximum Rating) ··························2.3 V to 5.5 V (6.5 V)
- Output Voltage Range (Fixed Output Voltage Type) ··········0.6 V to 3.3 V - Settable in 0.1 V Step
  (Adjustable Output Voltage Type)··········0.6 V to 5.5 V
- Output Voltage Accuracy (Fixed Output Voltage Type) ·······±1.5% (V_{SET}[2] ≥ 1.2 V), ±18 mV (V_{SET} < 1.2 V)
- Feedback Voltage Accuracy
  (Adjustable Output Voltage Type)··········±9 mV (V_{FB} = 0.6 V)
- Output Voltage/Feedback Voltage Temperature Coefficient···±100 ppm/°C
- Selectable Oscillator Frequency ································Typ. 6.0 MHz
- Oscillator Maximum Duty ··Min. 100%
- Built-in Driver ON Resistance (VIN = 3.6 V)····················Typ. Pch. 0.175 Ω, Nch. 0.155 Ω (RP519Z)
- Standby Current···Typ. 0 μA
- UVLO Detector Threshold ···Typ. 2.0 V
- Soft-start Time ···Typ. 0.15 ms
- Inductor Current Limit Circuit····································Typ. 1.6 A / 1.0 A - Selectable Current Limit
- Package ···WLCSP−6−P8 (1.28 mm x 0.88 mm x 0.36mm)

---

[1] This is an approximate value. The output current is dependent on conditions and external components.
[2] V_{SET} = Set Output Voltage

NO.EA-419-180711

APPLICATION

- Power source for Portable communication equipment such as mobile/smart phone, digital camera, and Note-PC
- Power source for Li-ion battery-used equipment

SELECTION GUIDE

The set output voltage, the output voltage type, the auto-discharge function[1], and the LX current limit for the ICs are user-selectable options.

Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
RP519ZxxX$-E2-F	WLCSP−6−P8	5,000 pcs	Yes	Yes

xx: Designation of the set output voltage (V_{SET})

For Fixed Output Voltage Type: 0.6 V (06) to 3.3 V (33) in 0.1 V steps[2]

For Adjustable Output Voltage Type: 00 only

X: Designation of LX Current Limit

1) Typ. 1.6 A

2) Typ. 1.0 A

$: Designation of Version

Version	Output Voltage Type	Auto-discharge Function	Oscillator Frequency	V_{SET}
A	Fixed	No	6.0 MHz	0.6 V to 3.3 V
B		Yes		
C	Adjustable	No		0.6 V to 5.5 V
D		Yes		

---

[1] Auto-discharge function quickly lowers the output voltage to 0 V, when the chip enable signal is switched from the active mode to the standby mode, by releasing the electrical charge accumulated in the external capacitor.

[2] 0.05 V step is also available as a custom code.

WLCSP-6 Pin Configurations

WLCSP-6 Pin Description

Pin No.	Symbol	Description
A1	MODE	Mode Control Pin ("H": forced PWM control, "L": PWM/VFM auto-switching control)
B1	LX	Switching Pin
C1	VOUT/ VFB	Output / Feedback Voltage Pin
A2	VIN	Input Voltage Pin
B2	CE	Chip Enable Pin (Active "H")
C2	GND	Ground Pin

RICOH

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings (GND = 0 V)

Symbol	Item	Rating	Unit
V_{IN}	Input Voltage	−0.3 to 6.5	V
V_{LX}	LX Pin Voltage	−0.3 to V_{IN} +0.3	V
V_{CE}	CE Pin Voltage	−0.3 to 6.5	V
V_{MODE}	MODE Pin Voltage	−0.3 to 6.5	V
V_{OUT}/V_{FB}	VOUT/VFB Pin Voltage	−0.3 to 6.5	V
I_{LX}	LX Pin Output Current	1.6	A
P_D	Power Dissipation[1] (WLCSP-6-P8, JEDEC STD. 51-9 Test Land Pattern)	880	mW
Tj	Junction Temperature	−40 to 125	°C
Tstg	Storage Temperature Range	−55 to 125	°C

ABSOLUTE MAXIMUM RATINGS
Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS

Symbol	Item	Rating	Unit
V_{IN}	Input Voltage	2.3 to 5.5	V
Ta	Operating Temperature Range	−40 to 85	°C

RECOMMENDED OPERATING CONDITIONS
All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

RICOH

OPERATING DESCRIPTIONS

Soft-start Time

Starting-up with CE Pin

The IC starts to operate when the CE pin voltage (V_{CE}) exceeds the threshold voltage. The threshold voltage is preset between CE "H" input voltage (V_{CEH}) and CE "L" input voltage (V_{CEL}).

After the start-of the start-up of the IC, soft-start circuit starts to operate. Then, after a certain period of time, the reference voltage (V_{REF}) in the IC gradually increases up to the specified value.

Notes: Soft start time (t_{START})[1] is not always equal to the turn-on speed of the step-down DC/DC converter. Please note that the turn-on speed could be affected by the power supply capacity, the output current, the inductance value and the C_{OUT} value.
Timing Chart when Starting-up with CE Pin

---

[1] Soft-start time (t_{START}) indicates the duration until the reference voltage (VREF) reaches the specified voltage after soft-start circuit's activation.

RICOH

Starting-up with Power Supply

After the power-on, when V_{IN} exceeds the UVLO released voltage (V_{UVLO2}), the IC starts to operate. Then, soft-start circuit starts to operate and after a certain period of time, V_{REF} gradually increases up to the specified value.

Notes: Please note that the turn-on speed of V_{OUT} could be affected by the power supply capacity, the output current, the inductance value, the C_{OUT} value and the turn-on speed of V_{IN} determined by C_{IN}.
Timing Chart when Starting-up with Power Supply

RICOH

Under Voltage Lockout (UVLO) Circuit

If V_{IN} becomes lower than V_{SET}, the step-down DC/DC converter stops the switching operation and ON duty becomes 100%, and then V_{OUT} gradually drops according to V_{IN}.

If the V_{IN} drops more and becomes lower than the UVLO detector threshold (V_{UVLO1}), the UVLO circuit starts to operate, V_{REF} stops, and Pch. and Nch. built-in switch transistors turn "OFF". As a result, V_{OUT} drops according to the C_{OUT} capacitance value and the load.

To restart the operation, V_{IN} needs to be higher than V_{UVLO2}. The timing chart below shows the voltage shifts of V_{REF}, V_{LX} and V_{OUT} when V_{IN} value is varied.

Notes: Falling edge (operating) and rising edge (releasing) waveforms of V_{OUT} could be affected by the initial voltage of C_{OUT} and the output current of V_{OUT}.
Timing Chart with Variations in Input Voltage (V_{IN})

RICOH

Current limit Circuit

Current limit circuit supervises the inductor peak current (the peak current flowing through Pch. Tr.) in each switching cycle, and if the current exceeds the LX current limit (I_{LXLIM}), it turns off Pch. Tr. I_{LXLIM} of the RP519Z is set to Typ.1.6 A or Typ.1.0 A.

Notes: I_{LXLIM} could be easily affected by self-heating or ambient environment. If the V_{IN} drops dramatically or becomes unstable due to short-circuit, protection operation could be affected.

Over-Current Protection Operation
Operation of Step-down DC/DC Converter and Output Current

The step-down DC/DC converter charges energy in the inductor when LX Tr. turns "ON", and discharges the energy from the inductor when LX Tr. turns "OFF" and controls with less energy loss, so that a lower output voltage (V_{OUT}) than the input voltage (V_{IN}) can be obtained. The operation of the step-down DC/DC converter is explained in the following figures.
Basic Circuit
Inductor Current (I_L) flowing through Inductor (L)

Step1. Pch. Tr. turns "ON" and I_L (i1) flows, L is charged with energy. At this moment, i1 increases from the minimum inductor current (I_{LMIN}), which is 0 A, and reaches the maximum inductor current (I_{LMAX}) in proportion to the on-time period (t_{ON}) of Pch. Tr.

Step2. When Pch. Tr. turns "OFF", L tries to maintain I_L at I_{LMAX}, so L turns Nch Tr. "ON" and I_L (i2) flows into L.

Step3. i2 decreases gradually and reaches I_{LMIN} after the open-time period (t_{OPEN}) of Nch. Tr., and then Nch. Tr. turns "OFF". This is called discontinuous current mode.

As the output current (I_{OUT}) increases, the off-time period (t_{OFF}) of Pch. Tr. runs out before I_L reaches I_{LMIN}. The next cycle starts, and Pch. Tr. turns "ON" and Nch. Tr. turns "OFF", which means I_L starts increasing from I_{LMIN}. This is called continuous current mode.

In PWM mode, V_{OUT} is maintained by controlling ton. The oscillator frequency (f_{OSC}) is maintained constant during PWM mode.

When the step-down DC/DC operation is constant, I_{LMIN} and I_{LMAX} during ton of Pch. Tr. would be same as during t_{OFF} of Pch. Tr. The current differential between I_{LMAX} and I_{LMIN} is described as ΔI, as the following equation 1.

$$\Delta I = I_{LMAX} - I_{LMIN} = V_{OUT} \times t_{OPEN} / L = (V_{IN} - V_{OUT}) \times t_{ON} / L \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \text{Equation 1}$$

The above equation is predicated on the following requirements.

$T = 1 / f_{OSC} = t_{ON} + t_{OFF}$

duty (%) $= t_{ON} / T \times 100 = t_{ON} \times f_{OSC} \times 100$

$t_{OPEN} \leq t_{OFF}$

In Equation 1, "$V_{OUT} \times t_{OPEN} / L$" shows the amount of current change in "OFF" state. Also, "$(V_{IN} - V_{OUT}) \times t_{ON} / L$" shows the amount of current change at "ON" state.

RICOH

Discontinuous Mode and Continuous Mode

As illustrated in Figure A., when I_{OUT} is relatively small, $t_{OPEN} < t_{OFF}$. In this case, the energy charged into L during t_{ON} will be completely discharged during t_{OFF}, as a result, $I_{LMIN} = 0$. This is called discontinuous mode. When I_{OUT} is gradually increased, eventually $t_{OPEN} = t_{OFF}$ and when I_{OUT} is increased further, eventually $I_{LMIN} > 0$ as illustrated in Figure B. This is called continuous mode.
Figure A. Discontinuous Mode
Figure B. Continuous Mode

In the continuous mode, the solution of Equation 1 is described as t_{ONC}.

$$t_{ONC} = T \times V_{OUT} / V_{IN} \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \text{Equation 2}$$

When $t_{ON} < t_{ONC}$, it is discontinuous mode, and when $t_{ON} = t_{ONC}$, it is continuous mode.

RICOH

NO.EA-419-180711

Forced PWM Mode and VFM Mode

Output voltage controlling method is selectable between a forced PWM control type and a PWM/VFM auto-switching control type, and can be set by the MODE pin. The forced PWM control switches at fixed frequency rate in order to reduce noise in low output current. The PWM/VFM auto-switching control automatically switches from PWM mode to VFM mode in order to achieve high efficiency in low output current.

Forced PWM Mode

By setting the MODE pin to "H", the IC switches the frequency at the fixed rate to reduce noise even when the output load is light. Therefore, when I_{OUT} is $\Delta I_L/2$ or less, I_{LMIN} becomes less than "0". That is, the accumulated electricity in CL is discharged through the IC side while I_L is increasing from I_{LMIN} to "0" during ton, and also while I_L is decreasing from "0" to I_{LMIN} during t_{OFF}.

VFM Mode

By setting the MODE pin to "L", in low output current, the IC automatically switches into VFM mode in order to achieve high efficiency. In VFM mode, ton is determined depending on V_{IN} and V_{OUT}.
Forced PWM Mode   **VFM Mode**

Cautions in selecting external parts

- Choose a low ESR ceramic capacitor. The capacitance of C_{IN} between V_{IN} and GND should be more than or equal to 4.7 µF. The capacitance of a ceramic capacitor (C_{OUT}) should be 10 µF. Also, choose the capacitor with consideration for bias characteristics and input/output voltages. See the above tables of "Input Voltage vs. Capacitance" and "Set Output Voltage vs. Capacitance".

- The phase compensation of this device is designed according to the C_{OUT} and L values. The inductance range of an inductor should be between 0.47µH to 0.56 µH in order to gain stability. See the above table of "Inductance Range vs. PWM Frequency".

- Choose an inductor that has small DC resistance, has enough permissible current and is hard to cause magnetic saturation. If the inductance value of the inductor becomes extremely small under the load conditions, the peak current of LX may increase along with the load current. As a result, over current protection circuit may start to operate when the peak current of LX reaches to LX limit current. Therefore, choose an inductor with consideration for the value of I_{LXMAX}. See the following page of "Calculation Conditions of LX Pin Maximum Output Current (I_{LXMAX})".

- As for the fixed output voltage type (RP519Z00XC/D), Output Voltage (V_{SET}) is settable by changing values of R1 and R2. V_{SET} is given by the following expression.

- As for the adjustable output voltage type, the set output voltage (V_{SET}) is adjustable by changing the resistance values of resistors (R1, R2) as follows. See the following table for each recommended value of R1, R2 and C1.

  $V_{SET} = V_{FB} \times (R1 + R2) / R2$

Set Output Voltage (V$_{SET}$) vs. R1 / R2 / C1 (Adjustable Output Voltage Type)

V$_{SET}$ [V]	R1 [kΩ]	R2 [kΩ]	C1 [pF]
0.6	0	220	Open
0.6 < V$_{SET}$ ≤ 0.9	R1 = (V$_{SET}$ / V$_{FB}$ -1) x R2	220	47
0.9 < V$_{SET}$ ≤ 1.8		220	33
1.8 < V$_{SET}$ ≤ 2.1		150	10
2.1 < V$_{SET}$ ≤ 2.4		100	10
2.4 < V$_{SET}$ ≤ 2.7		68	10
2.7 < V$_{SET}$ ≤ 3.0		47	10
3.0 < V$_{SET}$ ≤ V$_{IN}$		47	6.8

Calculation Conditions of LX Pin Maximum Output Current (I$_{LXMAX}$)

The following equations explain the relationship to determine I$_{LXMAX}$ at the ideal operation of the ICs in continuous mode.

Ripple Current P-P value is described as I$_{RP}$, ON resistance of Pch. Tr. is described as R$_{ONP}$, ON resistance of Nch. Tr. is described as R$_{ONN}$, and DC resistor of the inductor is described as R$_L$.

First, when Pch. Tr. is "ON", Equation 1 is satisfied.

$$V_{IN} = V_{OUT} + (R_{ONP} + R_L) \times I_{OUT} + L \times I_{RP} / t_{ON} \quad \text{Equation 1}$$

Second, when Pch. Tr. is "OFF" (Nch. Tr. is "ON"), Equation 2 is satisfied.

$$L \times I_{RP} / t_{OFF} = R_{ONN} \times I_{OUT} + V_{OUT} + R_L \times I_{OUT} \quad \text{Equation 2}$$

Put Equation 2 into Equation 1 to solve ON duty of Pch. Tr. (D$_{ON}$ = t$_{ON}$ / (t$_{OFF}$ + t$_{ON}$)):

$$D_{ON} = (V_{OUT} + R_{ONN} \times I_{OUT} + R_L \times I_{OUT}) / (V_{IN} + R_{ONN} \times I_{OUT} - R_{ONP} \times I_{OUT}) \quad \text{Equation 3}$$

Ripple Current is described as follows:

$$I_{RP} = (V_{IN} - V_{OUT} - R_{ONP} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / f_{OSC} / L \quad \text{Equation 4}$$

Peak current that flows through L, and LX Tr. is described as follows:

$$I_{LXMAX} = I_{OUT} + I_{RP} / 2 \quad \text{Equation 5}$$

RICOH

TECHNICAL NOTES

The performance of power source circuits using this IC largely depends on peripheral circuits. When selecting the peripheral components, please consider the conditions of use. Do not allow each component, PCB pattern or the IC to exceed their respected rated values (voltage, current, and power) when designing the peripheral circuits.

- Set the external components as close as possible to the IC and minimize the wiring between the components and the IC. Especially, place a capacitor (C_{IN}) as close as possible to the VIN pin and GND.

- Ensure the VIN and GND lines are sufficiently robust. If their impedance is too high, noise pickup or unstable operation may result.

- The VIN line, the GND line, the VOUT line, an inductor, and LX should make special considerations for the large switching current flows.

- The wiring between the VOUT pin and an inductor (L) (RP519ZxxXA/B) or between a resistor for setting output voltage (R1) and L (RP519Z00XC/D) should be separated from the wiring between L and Load.

- Over current protection circuit may be affected by self-heating or power dissipation environment.

- For any setting type of output voltage, the input/output voltage ratio must meet the following requirement to achieve a stable VFM mode at light load when the MODE pin is "L" (at PWM/VFM Auto Switching).

$$V_{OUT} / V_{IN} < 0.7$$
Available Voltage Area with Stable VFM Mode
