

TPS7A6650H-Q1 40-V, Ultralow- $I_{(q)}$, 150°C-Ambient-Temperature Regulator

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature: -40°C to 150°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level H2
 - Device CDM ESD Classification Level C4
- 4-V to 40-V Wide V_{in} Input Voltage Range With up to 45-V Transient
- Output Current: 50 mA
- Low Quiescent Current, $I_{(q)}$:
 - 2 μA when EN = Low (Shutdown Mode)
 - 12 μA Typical at Light Loads
- Low ESR Ceramic Output Stability Capacitor (2.2 μF –100 μF)
- 130-mV Dropout Voltage at 50 mA (Typical, $V_{(Vin)} = 4\text{ V}$)
- Fixed 5-V Output Voltage
- Low Input Voltage Tracking
- Integrated Power-On Reset
 - Programmable Reset-Pulse Delay
 - Open-Drain Reset Output
- Integrated Fault Protection
 - Thermal Shutdown
 - Short-Circuit Protection
- 8-Pin MSOP-DGN Package

2 Applications

- Powertrain Sensor Module
- Infotainment Systems With Sleep Mode
- Body Control Modules
- Always-On Battery Applications
 - Gateway Applications
 - Remote Keyless Entry Systems
 - Immobilizers

3 Description

The TPS7A6650H-Q1 is a low-dropout linear regulator designed for up to 40-V V_{in} operations. With only 12- μA quiescent current at no load, it is quite suitable for standby microprocessor control-unit systems, especially in automotive applications.

The device features integrated short-circuit and overcurrent protection. The device implements reset delay on power up to indicate the output voltage is stable and in regulation. One can program the delay with an external capacitor. A low-voltage tracking feature allows for a smaller input capacitor and can possibly eliminate the need of using a boost converter during cold-crank conditions.

The device operates in the -40°C to 150°C temperature range, which makes it well suited for power supplies in various automotive applications.

5 Pin Configuration and Functions

NC – No internal connection

NU – Make no external connection

Pin Functions

| PIN NAME | PIN NO. | TYPE | DESCRIPTION |
|----------|---------|------|--|
| CT | 4 | O | Reset-pulse delay adjustment. Connect this pin via a capacitor to GND |
| EN | 2 | I | Enable pin. The device enters the standby state when the enable pin becomes lower than the threshold. |
| NU | 7 | I | Not-used pin; make no external connection |
| GND | 5 | G | Ground reference |
| NC | 3 | — | Not-connected pin |
| PG | 6 | O | Output ready. This open-drain pin must connect to Vout via an external resistor. The output voltage going below threshold pulls it down. |
| Vin | 1 | P | Input power-supply voltage |
| Vout | 8 | O | Output voltage |
| — | — | — | Thermal pad |

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted) ⁽¹⁾

| | | MIN | MAX | UNIT |
|------------------|---|------|------|------|
| Vin, EN | Unregulated input ⁽²⁾ ⁽³⁾ | –0.3 | 45 | V |
| Vout | Regulated output | –0.3 | 7 | V |
| CT | | –0.3 | 25 | V |
| PG | | –0.3 | Vout | V |
| T _J | Operating junction temperature range | –40 | 160 | °C |
| T _{stg} | Storage temperature range | –65 | 160 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to GND

(3) Absolute maximum voltage, withstand 45 V for 200 ms

6.2 ESD Ratings

| | | | VALUE | UNIT | |
|--------------------|-------------------------|---|------------------------------|------|-------|
| V _(ESD) | Electrostatic discharge | Human body model (HBM), per AEC Q100-002 ⁽¹⁾ | ±4000 | V | |
| | | Charged device model (CDM), per AEC Q100-011 | All pins | | ±1000 |
| | | | Corner pins (1, 4, 5, and 8) | | ±1000 |

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

| | | | MIN | MAX | UNIT |
|------------------|-------------------------------|--|-----|-----|------|
| V _{in} | Unregulated input | | 4 | 40 | V |
| EN | | | 0 | 40 | V |
| CT | | | 0 | 20 | V |
| V _{out} | | | 1.5 | 5.5 | V |
| PG | Low voltage (I/O) | | 0 | 5.5 | V |
| T _A | Operating ambient temperature | | −40 | 150 | °C |

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | TPS7A6650H-Q1 | UNIT |
|-------------------------------|---|---------------|------|
| | | DGN (HVSSOP) | |
| | | 8 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 63.4 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 53 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance ⁽²⁾ | 37.4 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 3.7 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 37.1 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 13.5 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report (SPRA953).

(2) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

6.5 Electrical Characteristics

V_(Vin) = 14 V, 1 mΩ < ESR < 2 Ω, T_J = −40°C to 160°C (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--|-------------------------|--|-----|-----|------|
| SUPPLY VOLTAGE AND CURRENT (V_{in}) | | | | | |
| V _(Vin) | Input voltage | I _O = 1 mA | 5.5 | 40 | V |
| I _(q) | Quiescent current | V _(Vin) = 5.5 V to 40 V, EN = ON, I _O = 0.2 mA | 12 | 22 | μA |
| I _(Sleep) | Input sleep current | No load current and EN = OFF | | 4 | μA |
| I _(EN) | EN pin current | V _(EN) = 40 V | | 1 | μA |
| V _(VinUVLO) | Undervoltage detection | Ramp V _(Vin) down until output turns OFF | | 2.6 | V |
| V _(UVLOhys) | Undervoltage hysteresis | | 1 | | V |
| ENABLE INPUT (EN) | | | | | |
| V _{IL} | Logic input low level | | 0 | 0.4 | V |
| V _{IH} | Logic input high level | | 1.7 | | V |

Electrical Characteristics (continued)

(1) Design information – Not tested

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------------|----------------------|---|-----|-----|-----|---------------|
| TIMING FOR RESET (PG) | | | | | | |
| $t_{(\text{POR})}$ | Power-on-reset delay | Where C = delay capacitor value; capacitance C = 100 nF ⁽¹⁾ | 50 | 100 | 180 | ms |
| $t_{(\text{POR-fixed})}$ | | No capacitor on pin | 100 | 290 | 650 | μs |
| $t_{(\text{Deglitch})}$ | Reset deglitch time | | 20 | 250 | | μs |

(1) This information only is not tested in production and equation basis is $(C \times 1) / 1 \times 10^{-6} = t_d$ (delay time).
Where C = Delay capacitor value. Capacitance C range = 100 pF to 100 nF .

6.7 Qualification Summary

The TPS7A6650H-Q1 device has passed all the Grade 0 level qualification items required in AEC-Q100 with one exception: High temperature storage lifetime (HTSL). For the HTSL item, the Grade 0 level requirement is passing 175°C for 1000 hours of stress. For this device, it passed at 160°C for 1000 hours stress.

7 Detailed Description

7.1 Overview

This product is a combination of a low-dropout linear regulator with reset function. The power-on reset initializes once the V_{out} output exceeds 91.6% of the target value. The power-on-reset delay is a function of the value set by an external capacitor on the CT pin before releasing the PG pin high.

7.2 Functional Block Diagram

Figure 13. TPS7A6650H-Q1 Functional Block Diagram

7.3 Feature Description

7.3.1 Enable (EN)

This is a high-voltage-tolerant pin; high input activates the device and turns the regulator ON. One can connect this input to the V_{in} pin for self-bias applications.

7.3.2 Regulated Output (V_{out})

This is the regulated output based on the required voltage. The output has current limitation. During initial power up, the regulator has a soft start incorporated to control initial current through the pass element and the output capacitor.

Feature Description (continued)

In the event the regulator drops out of regulation, the output tracks the input minus a drop based on the load current. When the input voltage drops below the UVLO threshold, the regulator shuts down until the input voltage recovers above the minimum start-up level.

7.3.3 Power-On Reset (PG)

This is an output with an external pullup resistor to the regulated supply. The output remains low until the regulated V_{out} has exceeded approximately 90% of the set value and the power-on-reset delay has expired. The on-chip oscillator presets the delay. The regulated output falling below the 90% level asserts this output low after a short de-glitch time of approximately 250 μ s (typical).

7.3.4 Reset Delay Timer (CT)

An external capacitor on this pin sets the timer delay before the reset pin is asserted high. The constant output current charges an external capacitor until the voltage exceeds a threshold to trip an internal comparator. If this pin is open, the default delay time is 290 μ s (typ). After releasing the PG pin high, the capacitor on this pin discharges, thus allowing the capacitor to charge from approximately 0.2 V for the next power-on-reset delay-timer function.

An external capacitor, CT, defines the reset-pulse delay time, $t_{(POR)}$, with the charge time of:

$$t_{(POR)} = \frac{C_{(CT)} \times 1V}{1\mu A} \quad (1)$$

The power-on reset initializes once the output $V_{(Vout)}$ exceeds 91.6% of the programmed value. The power-on-reset delay is a function of the value set by an external capacitor on the CT pin before the releasing of the PG pin high.

Figure 14. Conditions for Activation of Reset

Feature Description (continued)

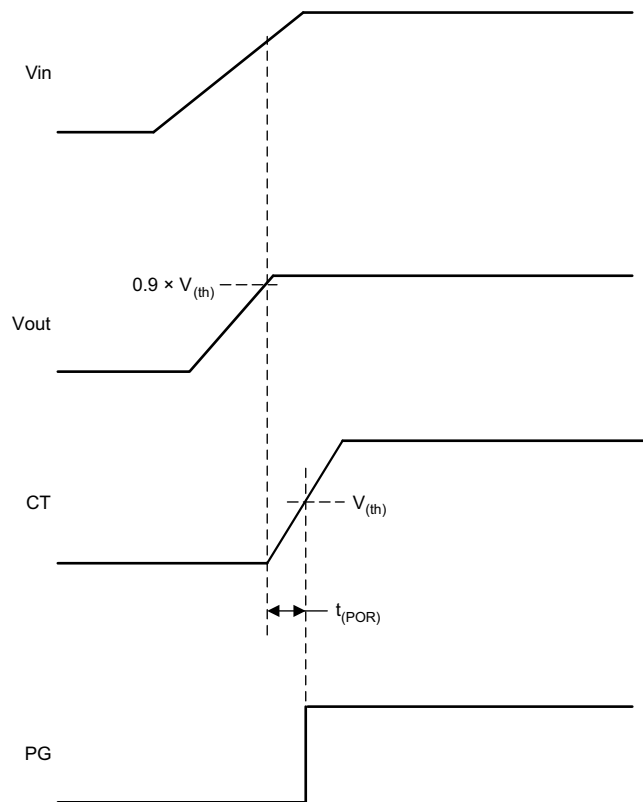

Figure 15. External Programmable Reset Delay

7.3.5 Undervoltage Shutdown

There is an internally fixed undervoltage shutdown threshold. Undervoltage shutdown activates when the input voltage on V_{in} drops below $V_{(inUVLO)}$. This ensures the regulator is not latched into an unknown state during low input supply voltage. If the input voltage has a negative transient which drops below the UVLO threshold and recovers, the regulator shuts down and powers up with a normal power-up sequence once the input voltage is above the required levels.

7.3.6 Low-Voltage Tracking

At low input voltages, the regulator drops out of regulation and the output voltage tracks input minus a voltage based on the load current (I_O) and switch resistance ($R_{(SW)}$). This allows for a smaller input capacitor and can possibly eliminate the need of using a boost convertor during cold-crank conditions.

7.3.7 Thermal Shutdown

These devices incorporate a thermal shutdown (TSD) circuit as a protection from overheating. For continuous normal operation, the junction temperature should not exceed the TSD trip point. If the junction temperature exceeds the TSD trip point, the output turns off. When the junction temperature falls below the TSD trip point, the output turns on again.

Thermal protection disables the output when the junction temperature rises to approximately 175°C, allowing the device to cool. Cooling of the junction temperature to approximately 155°C enables the output circuitry. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

Feature Description (continued)

The purpose of the design of the internal protection circuitry of the TPS7A6650H-Q1 is for protection against overload conditions, not as a replacement for proper heat-sinking. Continuously running the TPS7A6650H-Q1 device into thermal shutdown degrades device reliability.

7.4 Device Functional Modes

7.4.1 Operation With $V_{(VIN)} < 4\text{ V}$

The devices operate with input voltages above 4 V. The maximum UVLO voltage is 2.6 V, and the devices operate at an input voltage above 4 V. The devices can also operate at lower input voltages; no minimum UVLO voltage is specified. At input voltages below the actual UVLO voltage, the devices do not operate.

7.4.2 Operation With EN Control

The enable rising edge threshold voltage is 1.7 V (maximum). With the EN pin held above that voltage and the input voltage above 4 V, the device becomes active. The enable falling edge is 0.4 V (minimum). Holding the EN pin below that voltage disables the device, thus reducing the IC quiescent current.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS7A6650H-Q1 device is a 150-mA low-dropout linear regulator designed for up to 40-V V_{in} operation with only 12- μ A quiescent current at no load.

8.2 Typical Application

Figure 16 shows a typical application circuits for the TPS7A6650H-Q1. One may use different values of external components, depending on the end application. An application may require a larger output capacitor during fast load steps in order to prevent reset from occurring. TI recommends a low-ESR ceramic capacitor with dielectric of type X7R or X8R.

8.2.1 TPS7A6650H-Q1 Typical Application

Figure 16. Typical Application Schematic for TPS7A6650H-Q1

8.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 1 as the design parameters.

Table 1. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|----------------------------|----------------------------|
| Input voltage range | 4 V to 40 V |
| Output voltage | 5 V |
| Output current rating | 50 mA |
| Output capacitor range | 2.2 μ F to 100 μ F |
| Output capacitor ESR range | 1 m Ω to 2 Ω |
| CT capacitor range | 100 pF to 100 nF |

8.2.1.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
- Output voltage
- Output current rating
- Input capacitor
- Output capacitor
- Power-up-reset delay time

8.2.1.2.1 Input Capacitor

The device requires an input decoupling capacitor, the value of which depends on the application. The typical recommended value for the decoupling capacitor is 10 μF . The voltage rating must be greater than the maximum input voltage.

8.2.1.2.2 Output Capacitor

The device requires an output capacitor to stabilize the output voltage. The capacitor value should be between 2.2 μF and 100 μF . The ESR range should be between 1 $\text{m}\Omega$ and 2 Ω . TI recommends to selecting a ceramic capacitor with low ESR to improve the load transient response.

8.2.1.3 Application Performance Plot

Figure 17. Power Up (5 V), 20 ms/div, $I_L = 20 \text{ mA}$

9 Power Supply Recommendations

Design of the device is for operation from an input voltage supply with a range between 4 V and 28 V. This input supply must be well regulated. If the input supply is located more than a few inches from the TPS7A6650H-Q1 device, TI recommends adding an electrolytic capacitor with a value of 22 μF and a ceramic bypass capacitor at the input.

10 Layout

10.1 Layout Guidelines

10.1.1 Package Mounting

Solder pad footprint recommendations for the TPS7A6650H-Q1 are available at the end of this product data sheet and at www.ti.com.

10.1.2 Board Layout Recommendations to Improve PSRR and Noise Performance

For the layout of TPS7A6650H-Q1, place the input and output capacitors close to the devices as shown in [Figure 18](#). In order to enhance the thermal performance, TI recommends surrounding the device with some vias.

To improve ac performance such as PSRR, output noise, and transient response, TI recommends a board design with separate ground planes for Vin and Vout, with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor should connect directly to the GND pin of the device.

Minimize equivalent series inductance (ESL) and ESR in order to maximize performance and ensure stability. Place every capacitor as close as possible to the device and on the same side of the PCB as the regulator itself.

Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. TI strongly discourages the use of vias and long traces because they may impact system performance negatively and even cause instability.

If possible, and to ensure the maximum performance specified in this product data sheet, use the same layout pattern used for the TPS7A6650H-Q1 evaluation board, available at www.ti.com.

10.2 Layout Example

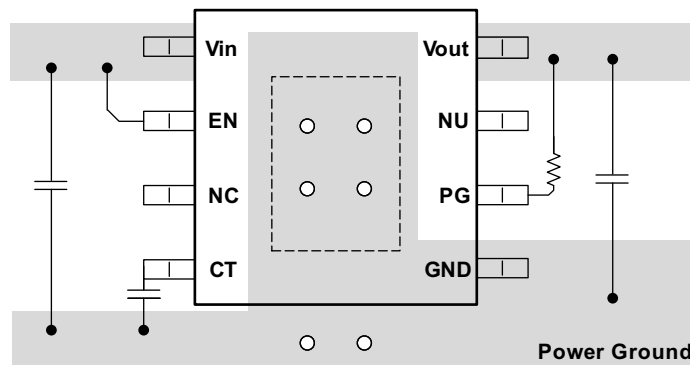

Figure 18. TPS7A6650H-Q1 Board Layout Diagram

10.3 Power Dissipation and Thermal Considerations

Calculate power dissipated in the device using [Equation 2](#).

$$P_D = I_O \times (V_{(Vin)} - V_{(Vout)}) + I_{(q)} \times V_{(Vin)} \quad (2)$$

where:

- P_D = continuous power dissipation
- I_O = output current
- $V_{(Vin)}$ = input voltage
- $V_{(Vout)}$ = output voltage

As $I_{(q)} \ll I_O$, therefore ignore the term $I_{(q)} \times V_{(Vin)}$ in [Equation 2](#).

For a device under operation at a given ambient air temperature (T_A), calculate the junction temperature (T_J) using [Equation 3](#).

Power Dissipation and Thermal Considerations (continued)

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (3)$$

where:

$R_{\theta JA}$ = junction-to-ambient air thermal impedance

$$\Delta T = T_J - T_A = (R_{\theta JA} \times P_D) \quad (4)$$

11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.3 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|-------------------|---------------|-------------------|-----------------|------|-------------|----------------------------|-------------------------|----------------------|--------------|-------------------------|---------|
| TPS7A6650HQDGNRQ1 | ACTIVE | MSOP- PowerPAD | DGN | 8 | 2500 | Green (RoHS & no Sb/Br) | CU NIPDAUAG | Level-2-260C-1 YEAR | -40 to 150 | 13LV | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|-------------------|----------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| TPS7A6650HQDGNRQ1 | MSOP-Power PAD | DGN | 8 | 2500 | 330.0 | 12.4 | 5.3 | 3.4 | 1.4 | 8.0 | 12.0 | Q1 |

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Length (mm) | Width (mm) | Height (mm) |
|-------------------|---------------|-----------------|------|------|-------------|------------|-------------|
| TPS7A6650HQDGNRQ1 | MSOP-PowerPAD | DGN | 8 | 2500 | 366.0 | 364.0 | 50.0 |

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
