

MPXH6300A, 20 to 300 kPa, Absolute, Integrated, Pressure Sensor

Freescale's MPXH6300A series sensor integrates on-chip, bipolar op amp circuitry and thin film resistor networks to provide a high output signal and temperature compensation. The small form factor and high reliability of on-chip integration make the Freescale pressure sensor a logical and economical choice for the system designer.

The MPXH6300A series piezoresistive transducer is a state-of-the-art, monolithic, signal conditioned, silicon pressure sensor. This sensor combines advanced micromachining techniques, thin film metallization, and bipolar semiconductor processing to provide an accurate, high level analog output signal that is proportional to applied pressure.

Features

- Improved accuracy at high temperature
- Available in super small outline package
- 1.5% maximum error over 0 °C to 85 °C
- Fully calibrated and compensated
- Ideally suited for microprocessor or microcontroller-based systems
- Temperature compensated from -40 °C to +125 °C
- Durable thermoplastic surface mount package
- Package porting and mounting options enable tube attachment for liquefied natural gas (LPG) or remote sensing applications

Typical applications

- Fuel injected car engines
- Vehicles powered by green gases (for example LPG and CNG)
- Small engines
- Industrial controls

2. In the Keyword search box at the top of the page, enter the device number MPXH6300A.
3. In the Refine Your Result pane on the left, click on the Documentation link.

MPXH6300A

1 General Description

1.1 Block diagram

Figure 1 shows a block diagram of the internal circuitry integrated on a pressure sensor chip.

Figure 1. Integrated pressure sensor block diagram

1.2 Pinout

Figure 2. Device pinout (top view)

Table 1. Pin functions

Pin	Name	Function
1	DNC	Do not connect to external circuitry or ground. Pin 1 is notated by chamfered corner.
2	V_S	Voltage supply
3	GND	Ground
4	V_{OUT}	Output voltage
5	DNC	Do not connect to external circuitry or ground.
6	DNC	Do not connect to external circuitry or ground.
7	DNC	Do not connect to external circuitry or ground.
8	DNC	Do not connect to external circuitry or ground.

2 Mechanical and Electrical Specifications

2.1 Maximum ratings

Table 2. Maximum ratings⁽¹⁾

Parametrics	Symbol	Value	Units
Maximum pressure (P1 > P2)	P_{max}	1200	kPa
Storage temperature	T_{stg}	-40 to +125	°C
Operating temperature	T_A	-40 to +125	°C
Output source current @ full-scale output ⁽²⁾	I_{o+}	0.5	mAdc
Output sink current @ minimum pressure offset ⁽²⁾	I_{o-}	-0.5	mAdc

1.Exposure beyond the specified limits may cause permanent damage or degradation to the device.

2.Maximum output current is controlled by effective impedance from V_{OUT} to GND or V_{OUT} to V_S in the application circuit.

2.2 Operating characteristics

Table 3. Operating characteristics ($V_S = 5.1 V_{DC}$, $T_A = 25 °C$ unless otherwise noted, $P1 > P2$.)

Characteristic	Symbol	Min	Typ	Max	Unit
Pressure range	P_{OP}	20	—	304	kPa
Supply voltage ⁽¹⁾	V_S	4.74	5.1	5.46	V_{DC}
Supply current	I_O	—	6.0	10	mAdc
Minimum pressure offset ⁽²⁾ (0 to 85 °C) @ $V_S = 5.1$ Volts	V_{OFF}	0.241	0.306	0.371	V_{DC}
Full-scale output ⁽³⁾ (0 to 85 °C) @ $V_S = 5.1$ Volts	V_{FSO}	4.847	4.912	4.977	V_{DC}
Full-scale span ⁽⁴⁾ (0 to 85 °C) @ $V_S = 5.1$ Volts	V_{FSS}	4.476	4.606	4.736	V_{DC}
Accuracy ⁽⁵⁾ (0 to 85 °C)	—	—	—	±1.5	% V_{FSS}
Sensitivity	V/P	—	16.2	—	mV/kPa
Response time ⁽⁶⁾	t_R	—	1.0	—	ms
Warm-up time ⁽⁷⁾	—	—	20	—	ms
Offset stability ⁽⁸⁾	—	—	±0.25	—	% V_{FSS}

1.Device is ratiometric within this specified excitation range.

2.Offset (V_{OFF}) is defined as the output voltage at the minimum rated pressure.

3.Full-scale output (V_{FSO}) is defined as the output voltage at the maximum or full-rated pressure.

4.Full-scale span (V_{FSS}) is defined as the algebraic difference between the output voltage at full-rated pressure and the output voltage at the minimum rated pressures

5.Accuracy is the deviation in actual output from nominal output over the entire pressure range and temperature range as a percent of span at 25 °C due to all sources of error including the following:

Linearity: Output deviation from a straight line relationship with pressure over the specified pressure range.

Temperature hysteresis: Output deviation at any temperature within the operating temperature range, after the temperature is cycled to and from the minimum or maximum operating temperature points, with zero differential pressure applied.

Pressure hysteresis: Output deviation at any pressure within the specified range, when this pressure is cycled to and from minimum or maximum rated pressure at 25 °C

TcSpan: Output deviation over the temperature range of 0 to 85 °C, relative to 25 °C.

TcOffset: Output deviation with minimum rated pressure applied, over the temperature range of 0 to 85 °C, relative to 25 °C.

Variation from Nominal: The variation from nominal values, for offset or full-scale span, as a percent of V_{FSS} , at 25 °C.

6.Response time is defined as the time for the incremental change in the output to go from 10% to 90% of its final value when subjected to a specified step change in pressure.

7.Warm-up time is defined as the time required for the product to meet the specified output voltage after the pressure has been stabilized.

8.Offset stability is the product's output deviation when subjected to 1000 cycles of pulsed pressure, temperature cycling with bias test.

3 On-chip Temperature Compensation and Calibration

Figure 3 illustrates the absolute sensing chip in the basic super small outline chip carrier (case 98ARH99066A).

Figure 4 shows a typical application circuit (output source current operation).

Figure 5 shows the sensor output signal relative to pressure input. Typical minimum and maximum output curves are shown for operation over 0 to 85 °C temperature range. The output will saturate outside of the rated pressure range.

A fluorosilicone gel isolates the die surface and wire bonds from the environment, while allowing the pressure signal to be transmitted to the silicon diaphragm. The MPXH6300A pressure sensor operating characteristics, internal reliability and qualification tests are based on use of dry air as the pressure media. Media other than dry air may have adverse effects on sensor performance and long-term reliability. Contact the factory for information regarding media compatibility in your application.

Figure 3. Cross-sectional diagram (not-to-scale)

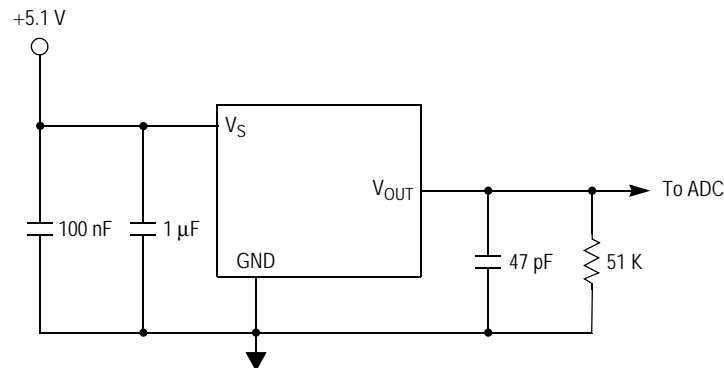

Figure 4. Recommended power supply decoupling and output filtering

Figure 5. Output vs. absolute pressure

Nominal Transfer Value: $V_{out} = V_S \times (0.00318 \times P - 0.00353)$
 $\pm (\text{Pressure Error} \times \text{Temp Factor} \times 0.00318 \times V_S)$
 $V_S = 5.1 \pm 0.36 \text{ Vdc}$

Figure 6. Transfer function

NOTE: The Temperature Multiplier is a linear response from 0 °C to -40 °C and from 85 °C to 125 °C.

4 Package Information

4.1 Minimum recommended footprint for surface mounted applications

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor package must be the correct size to ensure proper solder connection interface between the board and the package. With the correct pad geometry, the packages will self-align when subjected to a solder reflow process. It is always recommended to fabricate boards with a solder mask layer to avoid bridging and/or shorting between solder pads, especially on tight tolerances and/or tight layouts.
