## ENHANCED PRODUCT FEATURES

Supports defense and aerospace applications (AQEC)
Military temperature range $\left(-55^{\circ} \mathrm{C}\right.$ to $+125^{\circ} \mathrm{C}$ )
Controlled manufacturing baseline
Enhanced product change notification
Qualification data available on request

## APPLICATIONS

Size-critical multichannel isolation SPI interface/data converter isolation RS-232/RS-422/RS-485 transceiver isolation Digital field bus isolation

## GENERAL DESCRIPTION

The ADuM1200-EP ${ }^{1}$ is a dual-channel, digital isolator based on the Analog Devices, Inc., iCoupler ${ }^{\bullet}$ technology. Combining high speed CMOS and monolithic transformer technologies, this isolation component provides outstanding performance characteristics superior to alternatives, such as optocouplers.

By avoiding the use of LEDs and photodiodes, $i$ Coupler devices remove the design difficulties commonly associated with optocouplers. The typical optocoupler concerns regarding uncertain current transfer ratios, nonlinear transfer functions, and temperature and lifetime effects are eliminated with the simple $i$ Coupler digital interfaces and stable performance characteristics. The need for external drivers and other discrete components is eliminated with these $i$ Coupler products. Furthermore, $i$ Coupler devices consume one-tenth to one-sixth the power of optocouplers at comparable signal data rates.

The ADuM1200-EP isolator provides two independent isolation channels with a supply voltage on either side ranging from 3.0 V to 5.5 V . In addition, the ADuM1200-EP provides low pulse width distortion and tight channel-to-channel matching. Unlike other optocoupler alternatives, the ADuM1200-EP isolator has a patented refresh feature that ensures dc correctness in the absence of input logic transitions and during power-up/ power-down conditions.

Full details about this enhanced product are available in the ADuM1200/ADuM1201 data sheet, which should be consulted in conjunction with this data sheet.

${ }^{1}$ The supply current values are for both channels combined when running at identical data rates. Output supply current values are specified with no output load present.
${ }^{2}$ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
${ }^{3}$ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{1 \times}$ signal to the $50 \%$ level of the falling edge of the $V_{0 x}$ signal. $t_{\text {PLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{1 \times}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{\text {ox }}$ signal.
${ }^{5} \mathrm{t}_{\text {PSK }}$ is the magnitude of the worst-case difference in $\mathrm{t}_{\text {PHL }}$ and/or $\mathrm{t}_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{H}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{OX}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{o x}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in the signal data rate.

## ELECTRICAL CHARACTERISTICS-3 V OPERATION

All voltages are relative to their respective ground; $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 3.6 \mathrm{~V}, 3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operating range, unless otherwise noted; all typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD} 2}=3 \mathrm{~V}$.

${ }^{1}$ The supply current values are for both channels combined when running at identical data rates. Output supply current values are specified with no output load present.
${ }^{2}$ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
${ }^{3}$ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{1 \times}$ signal to the $50 \%$ level of the falling edge of the $V_{\text {Ox }}$ signal. $t_{\text {PLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{1 \times}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \times}$ signal.
${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ and/or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{H}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{OX}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0 \mathrm{x}}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in the signal data rate.

${ }^{1}$ All voltages are relative to their respective ground.
${ }^{2} V_{D D I}$ and $V_{D D O}$ refer to the supply voltages on the input and output sides of a given channel, respectively.
${ }^{3}$ See Figure 2 for maximum rated current values for various temperatures.
${ }^{4}$ Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings can cause latch-up or permanent damage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
