512+16+4KB RAM, USB OTG HS/FS, 28 com IF, LCD, DSI

Datasheet - production data

## Features

### Includes ST state-of-the-art patented technology

- Core: Arm<sup>®</sup> 32-bit Cortex<sup>®</sup>-M7 CPU with DPFPU, ART Accelerator and L1-cache: 16 Kbytes I/D cache, allowing 0-wait state execution from embedded Flash and external memories, up to 216 MHz, MPU, 462 DMIPS/2.14 DMIPS/MHz (Dhrystone 2.1), and DSP instructions.
- Memories
  - Up to 2 Mbytes of Flash memory organized into two banks allowing read-while-write
  - SRAM: 512 Kbytes (including 128 Kbytes of data TCM RAM for critical real-time data) + 16 Kbytes of instruction TCM RAM (for critical real-time routines) + 4 Kbytes of backup SRAM
  - Flexible external memory controller with up to 32-bit data bus: SRAM, PSRAM, SDRAM/LPSDR SDRAM, NOR/NAND memories
- Dual mode Quad-SPI
- Graphics
  - Chrom-ART Accelerator (DMA2D), graphical hardware accelerator enabling enhanced graphical user interface
  - Hardware JPEG codec
  - LCD-TFT controller supporting up to XGA resolution
  - MIPI<sup>®</sup> DSI host controller supporting up to 720p 30 Hz resolution
- Clock, reset and supply management
  - 1.7 V to 3.6 V application supply and I/Os
  - POR, PDR, PVD and BOR
  - Dedicated USB power
  - 4-to-26 MHz crystal oscillator
  - Internal 16 MHz factory-trimmed RC (1% accuracy)

- 32 kHz oscillator for RTC with calibration
- Internal 32 kHz RC with calibration
- Low-power
  - Sleep, Stop and Standby modes
  - V<sub>BAT</sub> supply for RTC, 32×32 bit backup registers + 4 Kbytes backup SRAM
- 3×12-bit, 2.4 MSPS ADC: up to 24 channels
- Digital filters for sigma delta modulator (DFSDM), 8 channels / 4 filters
- 2×12-bit D/A converters
- General-purpose DMA: 16-stream DMA controller with FIFOs and burst support
- Up to 18 timers: up to thirteen 16-bit (1x low-power 16-bit timer available in Stop mode) and two 32-bit timers, each with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input. All 15 timers running up to 216 MHz. 2x watchdogs, SysTick timer
- Debug mode
  - SWD and JTAG interfaces
  - Cortex<sup>®</sup>-M7 Trace Macrocell<sup>™</sup>
- Up to 168 I/O ports with interrupt capability
  - Up to 164 fast I/Os up to 108 MHz
  - Up to 166 5 V-tolerant I/Os

- Up to 28 communication interfaces
  - Up to 4 I<sup>2</sup>C interfaces (SMBus/PMBus)
  - Up to 4 USARTs/4 UARTs (12.5 Mbit/s, ISO7816 interface, LIN, IrDA, modem control)
  - Up to 6 SPIs (up to 54 Mbit/s), 3 with muxed simplex I<sup>2</sup>S for audio
  - 2 x SAs (serial audio interface)
  - 3 × CANs (2.0B Active) and 2x SDMMCs
  - SPDIFRX interface
  - HDMI-CEC
  - MDIO slave interface
- Advanced connectivity
  - USB 2.0 full-speed device/host/OTG controller with on-chip PHY
  - USB 2.0 high-speed/full-speed device/host/OTG controller with dedicated DMA, on-chip full-speed PHY and ULPI
  - 10/100 Ethernet MAC with dedicated DMA: supports IEEE 1588v2 hardware, MII/RMII
- 8- to 14-bit camera interface up to 54 Mbyte/s
- True random number generator
- CRC calculation unit
- RTC: subsecond accuracy, hardware calendar
- 96-bit unique ID

## 2 Description

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx devices are based on the high-performance Arm® Cortex®-M7 32-bit RISC core operating at up to 216 MHz frequency. The Cortex®-M7 core features a floating point unit (FPU) which supports Arm® double-precision and single-precision data-processing instructions and data types. It also implements a full set of DSP instructions and a memory protection unit (MPU) which enhances the application security.

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx devices incorporate high-speed embedded memories with a Flash memory up to 2 Mbytes, 512 Kbytes of SRAM (including 128 Kbytes of Data TCM RAM for critical real-time data), 16 Kbytes of instruction TCM RAM (for critical real-time routines), 4 Kbytes of backup SRAM available in the lowest power modes, and an extensive range of enhanced I/Os and peripherals connected to two APB buses, two AHB buses, a 32-bit multi-AHB bus matrix and a multi layer AXI interconnect supporting internal and external memories access.

All the devices offer three 12-bit ADCs, two DACs, a low-power RTC, twelve general-purpose 16-bit timers including two PWM timers for motor control, two general-purpose 32-bit timers, a true random number generator (RNG). They also feature standard and advanced communication interfaces:

- Up to four I2Cs
- Six SPIs, three I2Ss in half-duplex mode. To achieve audio class accuracy, the I2S peripherals can be clocked via a dedicated internal audio PLL or via an external clock to allow synchronization.
- Four USARTs plus four UARTs
- An USB OTG full-speed and a USB OTG high-speed with full-speed capability (with the ULPI)
- Three CANs
- Two SAI serial audio interfaces
- Two SDMMC host interfaces
- Ethernet and camera interfaces
- LCD-TFT display controller
- Chrom-ART Accelerator
- SPDIFRX interface
- HDMI-CEC

Advanced peripherals include two SDMMC interfaces, a flexible memory control (FMC) interface, a Quad-SPI Flash memory interface, a camera interface for CMOS sensors.

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx devices operate in the -40 to +105 °C temperature range from a 1.7 to 3.6 V power supply. Dedicated supply inputs for USB (OTG\_FS and OTG\_HS) and SDMMC2 (clock, command and 4-bit data) are available on all the packages except LQFP100 for a greater power supply choice.

The supply voltage can drop to 1.7 V with the use of an external power supply supervisor. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx devices offer devices in 11 packages ranging from 100 pins to 216 pins. The set of included peripherals changes with the device chosen.

These features make the STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx microcontrollers suitable for a wide range of applications:

- Motor drive and application control
- Medical equipment
- Industrial applications: PLC, inverters, circuit breakers
- Printers, and scanners
- Alarm systems, video intercom, and HVAC
- Home audio appliances
- Mobile applications, Internet of Things
- Wearable devices: smartwatches

The following table lists the peripherals available on each part number.

1. For the LQFP100 package, only FMC Bank1 is available. Bank1 can only support a multiplexed NOR/PSRAM memory using the NE1 Chip Select.
2. The SPI1, SPI2 and SPI3 interfaces give the flexibility to work in an exclusive way in either the SPI mode or the I2S audio mode.
3. SDMMC2 supports a dedicated power rail for clock, command and data 0..4 lines, feature available starting from 144 pin package.
4. DSI host interface is only available on STM32F769x sales types.
5. 216 MHz maximum frequency for - 40°C to + 85°C ambient temperature range (200 MHz maximum frequency for - 40°C to + 105°C ambient temperature range).
6.  $V_{DD}V_{DDA}$  minimum value of 1.7 V is obtained when the internal reset is OFF (refer to [Section 3.18.2: Internal reset OFF](#)).
7. UFBGA176 is not available for STM32F769x sales types.

### Full compatibility throughout the family

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx devices are fully pin-to-pin, compatible with the STM32F4xxx devices, allowing the user to try different peripherals, and reaching higher performances (higher frequency) for a greater degree of freedom during the development cycle.

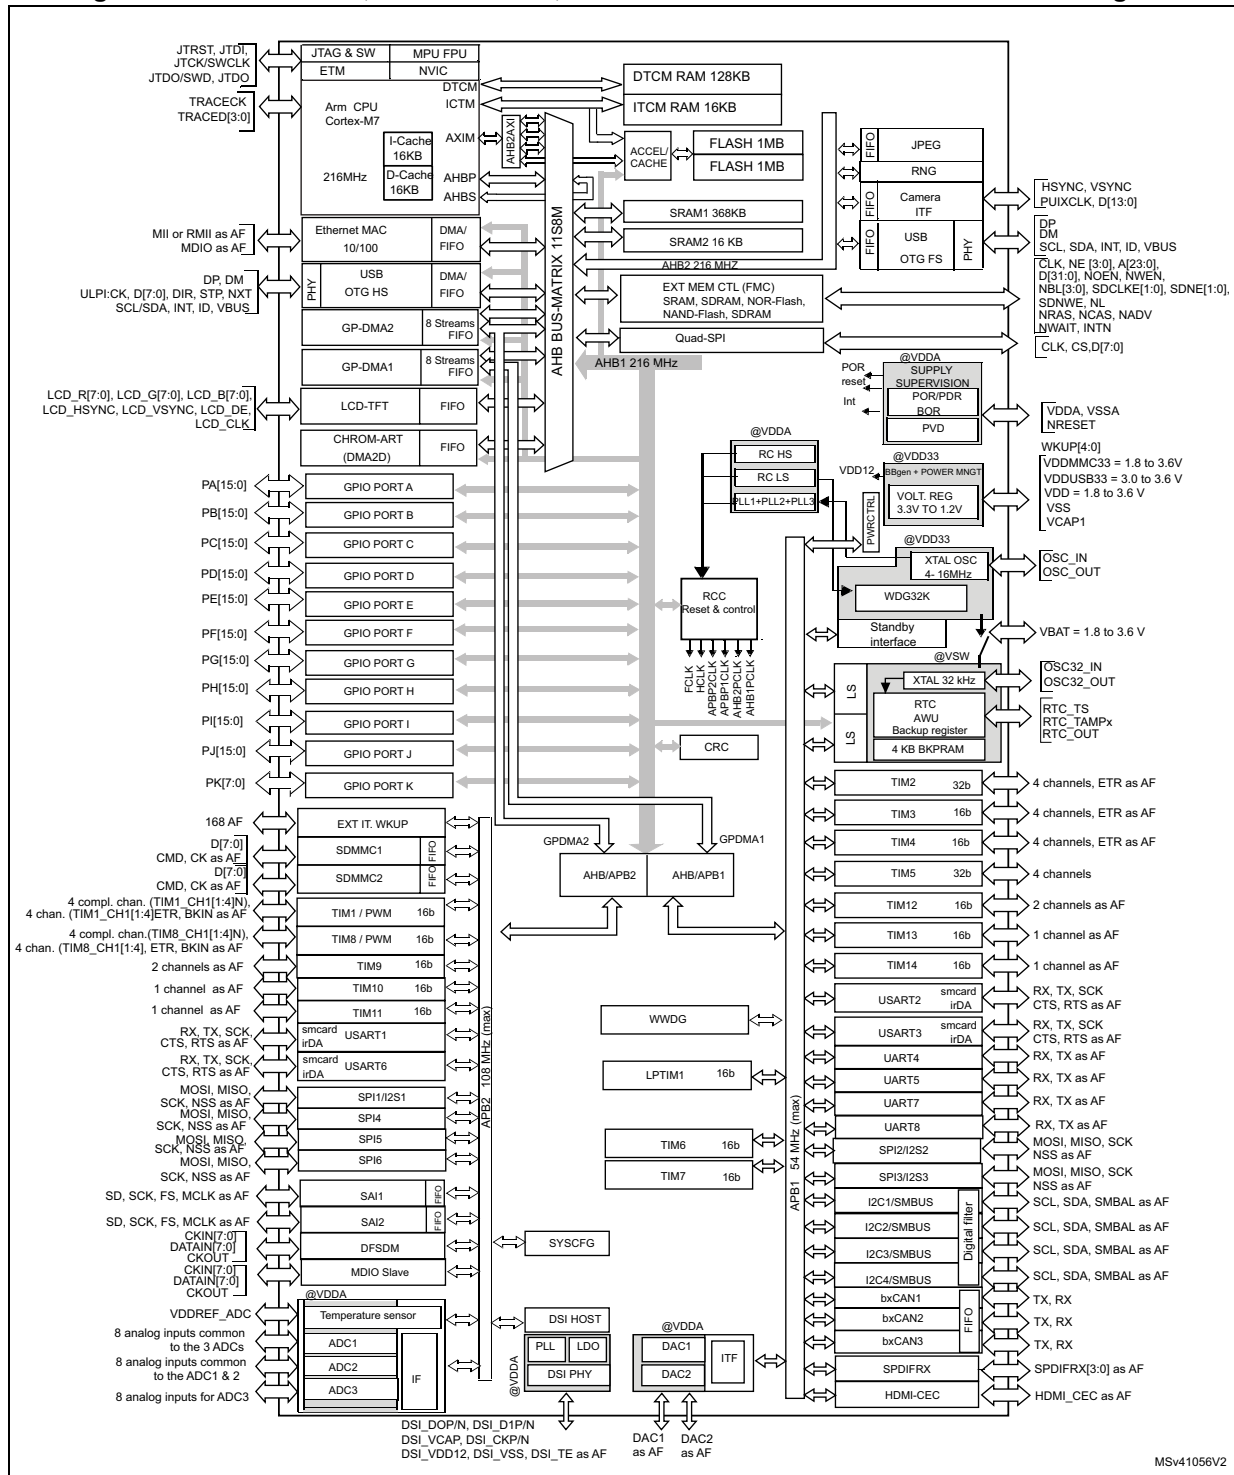

Figure 1 gives compatible board designs between the STM32F7xx and STM32F4xx families.

Figure 1. Compatible board design for LQFP100 package

The STM32F76x LQFP144, LQFP176, LQFP208, TFBGA216, UFBGA176 packages are fully pin to pin compatible with STM32F4xx devices.

1. The timers connected to APB2 are clocked from TIMxCLK up to 216 MHz, while the timers connected to APB1 are clocked from TIMxCLK either up to 108 MHz or 216 MHz depending on TIMPRE bit configuration in the RCC\_DCKCFGR register.

## 3 Functional overview

### 3.1 Arm<sup>®</sup> Cortex<sup>®</sup>-M7 with FPU

The Arm<sup>®</sup> Cortex<sup>®</sup>-M7 with FPU processor is the latest generation of Arm processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering an outstanding computational performance and low interrupt latency.

The Cortex<sup>®</sup>-M7 processor is a highly efficient high-performance featuring:

- Six-stage dual-issue pipeline
- Dynamic branch prediction
- Harvard caches (16 Kbytes of I-cache and 16 Kbytes of D-cache)
- 64-bit AXI4 interface
- 64-bit ITCM interface
- 2x32-bit DTCM interfaces

The processor supports the following memory interfaces:

- Tightly Coupled Memory (TCM) interface.
- Harvard instruction and data caches and AXI master (AXIM) interface.
- Dedicated low-latency AHB-Lite peripheral (AHBP) interface.

The processor supports a set of DSP instructions which allow an efficient signal processing and a complex algorithm execution.

It supports single and double precision FPU (floating point unit), speeds up software development by using metalanguage development tools, while avoiding saturation.

*Figure 2* shows the general block diagram of the STM32F76xxx family.

*Note:* The Cortex<sup>®</sup>-M7 with FPU core is binary compatible with the Cortex<sup>®</sup>-M4 core.

### 3.2 Memory protection unit

The memory protection unit (MPU) is used to manage the CPU accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task. This memory area is organized into up to 8 protected areas that can in turn be divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory.

The MPU is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

### 3.3 Embedded Flash memory

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx devices embed a Flash memory of up to 2 Mbytes available for storing programs and data. The Flash interface features:

- Single /or Dual bank operating modes,
- Read-While-Write (RWW) in Dual bank mode.

### 3.4 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

### 3.5 Embedded SRAM

All the devices feature:

- System SRAM up to 512 Kbytes:
  - SRAM1 on AHB bus Matrix: 368 Kbytes
  - SRAM2 on AHB bus Matrix: 16 Kbytes
  - DTCM-RAM on TCM interface (Tightly Coupled Memory interface): 128 Kbytes for critical real-time data.
- Instruction RAM (ITCM-RAM) 16 Kbytes:
  - It is mapped on TCM interface and reserved only for CPU Execution/Instruction useful for critical real-time routines.

The Data TCM RAM is accessible by the GP-DMA's and peripherals DMA's through specific AHB slave of the CPU. The instruction TCM RAM is reserved only for CPU. It is accessed at CPU clock speed with 0 wait states.

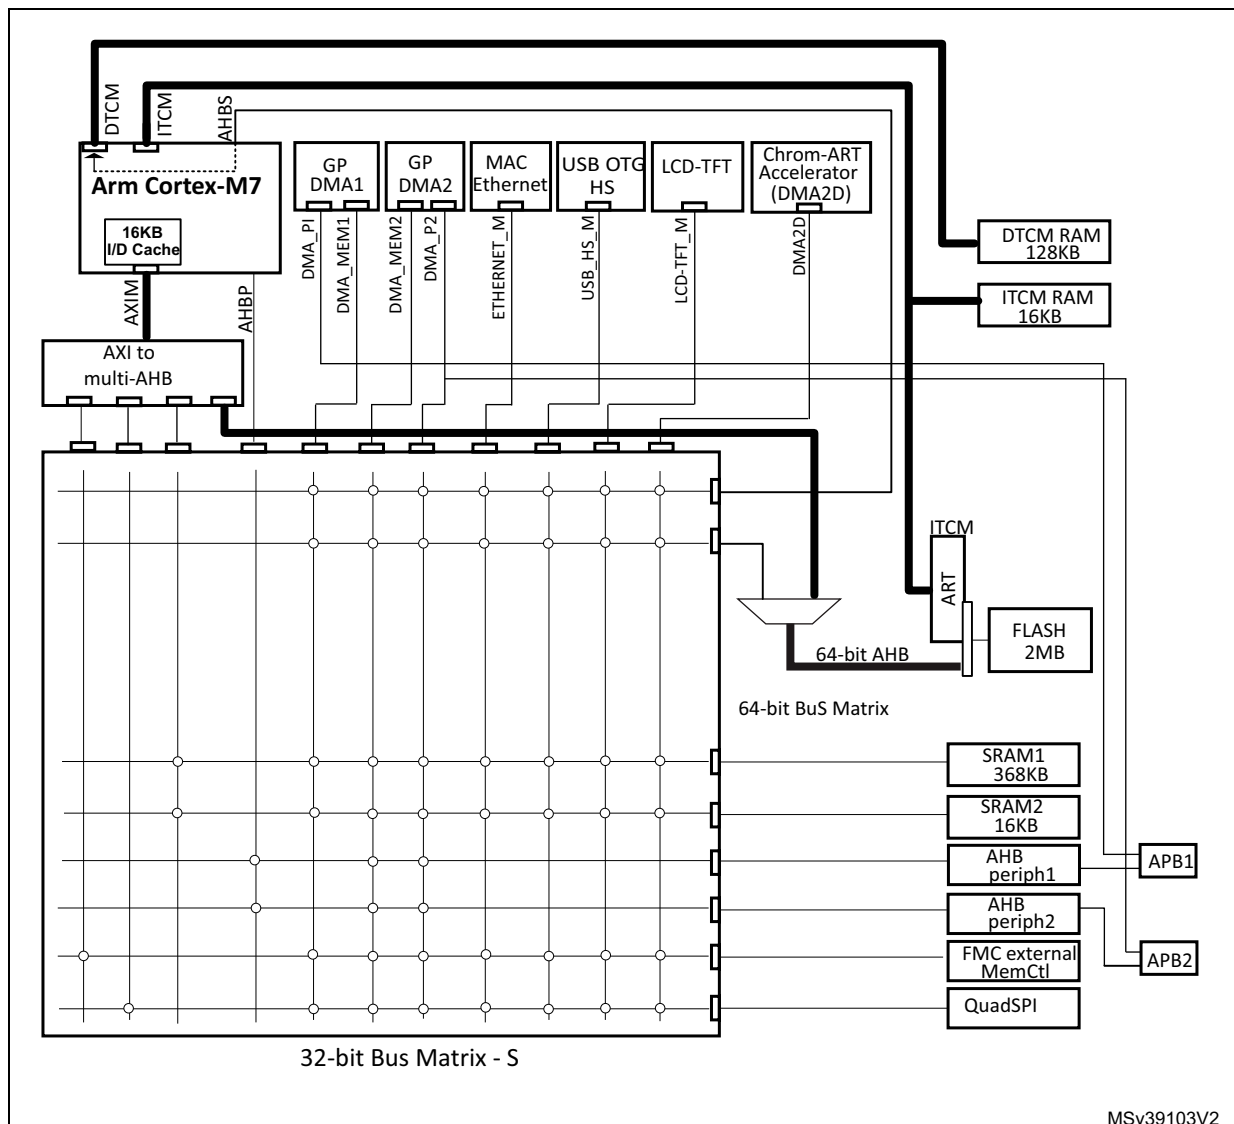

- 4 Kbytes of backup SRAM
  - This area is accessible only from the CPU. Its content is protected against possible unwanted write accesses, and is retained in Standby or VBAT mode.

### 3.6 AXI-AHB bus matrix

The STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx system architecture is based on 2 sub-systems:

- An AXI to multi AHB bridge converting AXI4 protocol to AHB-Lite protocol:
  - 3x AXI to 32-bit AHB bridges connected to AHB bus matrix
  - 1x AXI to 64-bit AHB bridge connected to the embedded Flash memory
- A multi-AHB Bus-Matrix
  - The 32-bit multi-AHB bus matrix interconnects all the masters (CPU, DMAs, Ethernet, USB HS, LCD-TFT, and DMA2D) and the slaves (Flash memory, RAM, FMC, Quad-SPI, AHB and APB peripherals) and ensures a seamless and efficient operation even when several high-speed peripherals work simultaneously.

**Figure 3. STM32F765xx, STM32F767xx, STM32F768Ax and STM32F769xx AXI-AHB bus matrix architecture<sup>(1)</sup>**

1. The above figure has large wires for 64-bits bus and thin wires for 32-bits bus.

### 3.7 DMA controller (DMA)

The devices feature two general-purpose dual-port DMAs (DMA1 and DMA2) with 8 streams each. They are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. They feature dedicated FIFOs for APB/AHB peripherals, support burst transfer and are designed to provide the maximum peripheral bandwidth (AHB/APB).

The two DMA controllers support circular buffer management, so that no specific code is needed when the controller reaches the end of the buffer. The two DMA controllers also have a double buffering feature, which automates the use and switching of two memory buffers without requiring any special code.

Each stream is connected to dedicated hardware DMA requests, with support for software trigger on each stream. The configuration is made by software and the transfer sizes between the source and the destination are independent.

The DMA can be used with the main peripherals:

- SPI and I<sup>2</sup>S
- I<sup>2</sup>C
- USART
- General-purpose, basic and advanced-control timers TIMx
- DAC
- SDMMC
- Camera interface (DCMI)
- ADC
- SAI
- SPDIFRX
- Quad-SPI
- HDMI-CEC
- JPEG codec
- DFSDM1

### 3.8 Flexible memory controller (FMC)

The Flexible memory controller (FMC) includes three memory controllers:

- The NOR/PSRAM memory controller
- The NAND/memory controller
- The Synchronous DRAM (SDRAM/Mobile LPDDR SDRAM) controller

The main features of the FMC controller are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR Flash memory/OneNAND Flash memory
  - PSRAM (4 memory banks)
  - NAND Flash memory with ECC hardware to check up to 8 Kbytes of data
- Interface with synchronous DRAM (SDRAM/Mobile LPDDR SDRAM) memories
- 8-, 16-, 32-bit data bus width
- Independent Chip Select control for each memory bank
- Independent configuration for each memory bank
- Write FIFO
- Read FIFO for SDRAM controller
- The maximum FMC\_CLK/FMC\_SDCLK frequency for synchronous accesses is HCLK/2

#### LCD parallel interface

The FMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes, and is flexible enough to adapt to specific LCD interfaces. This LCD parallel interface capability makes it easy to build cost-effective graphic applications using LCD modules with embedded controllers or high performance solutions using external controllers with dedicated acceleration.

### 3.9 Quad-SPI memory interface (QUADSPI)

All the devices embed a Quad-SPI memory interface, which is a specialized communication interface targeting Single, Dual or Quad-SPI Flash memories. It can work in:

- Direct mode through registers
- External Flash status register polling mode
- Memory mapped mode.

Up to 256 Mbytes external Flash are memory mapped, supporting 8, 16 and 32-bit access. Code execution is supported.

The opcode and the frame format are fully programmable. The communication can be either in Single Data Rate or Dual Data Rate.

### 3.10 LCD-TFT controller

The LCD-TFT display controller provides a 24-bit parallel digital RGB (Red, Green, Blue) and delivers all signals to interface directly to a broad range of LCD and TFT panels up to XGA (1024x768) resolution with the following features:

- 2 display layers with dedicated FIFO (64x32-bit)
- Color Look-Up table (CLUT) up to 256 colors (256x24-bit) per layer
- Up to 8 input color formats selectable per layer
- Flexible blending between two layers using alpha value (per pixel or constant)
- Flexible programmable parameters for each layer
- Color keying (transparency color)
- Up to 4 programmable interrupt events

### 3.11 Chrom-ART Accelerator (DMA2D)

The Chrom-Art Accelerator (DMA2D) is a graphic accelerator which offers advanced bit blitting, row data copy and pixel format conversion. It supports the following functions:

- Rectangle filling with a fixed color
- Rectangle copy
- Rectangle copy with pixel format conversion
- Rectangle composition with blending and pixel format conversion

Various image format codings are supported, from indirect 4bpp color mode up to 32bpp direct color. It embeds dedicated memory to store color lookup tables.

An interrupt can be generated when an operation is complete or at a programmed watermark.

All the operations are fully automatized and are running independently from the CPU or the DMAs.

### 3.12 Nested vectored interrupt controller (NVIC)

The devices embed a nested vectored interrupt controller able to manage 16 priority levels, and handle up to 110 maskable interrupt channels plus the 16 interrupt lines of the Cortex<sup>®</sup>-M7 with FPU core.

- Closely coupled NVIC gives low-latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Allows early processing of interrupts
- Processing of late arriving, higher-priority interrupts
- Support tail chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimum interrupt latency.

### 3.13 JPEG codec (JPEG)

The JPEG codec provides an fast and simple hardware compressor and decompressor of JPEG images with full management of JPEG headers.

The JPEG codec main features:

- 8-bit/channel pixel depths
- Single clock per pixel encoding and decoding
- Support for JPEG header generation and parsing
- Up to four programmable quantization tables
- Fully programmable Huffman tables (two AC and two DC)
- Fully programmable minimum coded unit (MCU)
- Encode/decode support (non simultaneous)
- Single clock Huffman coding and decoding
- Two-channel interface: Pixel/Compress In, Pixel/Compressed Out
- Stallable design
- Support for single, greyscale component
- Functionality to enable/disable header processing
- Internal register interface
- Fully synchronous design
- Configured for high-speed decode mode

### 3.14 External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 25 edge-detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 168 GPIOs can be connected to the 16 external interrupt lines.

### 3.15 Clocks and startup

On reset the 16 MHz internal HSI RC oscillator is selected as the default CPU clock. The 16 MHz internal RC oscillator is factory-trimmed to offer 1% accuracy. The application can then select as system clock either the RC oscillator or an external 4-26 MHz clock source. This clock can be monitored for failure. If a failure is detected, the system automatically switches back to the internal RC oscillator and a software interrupt is generated (if enabled). This clock source is input to a PLL thus allowing to increase the frequency up to 216 MHz. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example if an indirectly used external oscillator fails).

Several prescalers allow the configuration of the two AHB buses, the high-speed APB (APB2) and the low-speed APB (APB1) domains. The maximum frequency of the two AHB buses is 216 MHz while the maximum frequency of the high-speed APB domains is 108 MHz. The maximum allowed frequency of the low-speed APB domain is 54 MHz.

The devices embed two dedicated PLL (PLLI2S and PLLSAI) which allow to achieve audio class performance. In this case, the I<sup>2</sup>S and SAI master clock can generate all standard sampling frequencies from 8 kHz to 192 kHz.

### 3.16 Boot modes

At startup, the boot memory space is selected by the BOOT pin and BOOT\_ADDx option bytes, allowing to program any boot memory address from 0x0000 0000 to 0x3FFF FFFF which includes:

- All Flash address space mapped on ITCM or AXIM interface
- All RAM address space: ITCM, DTCM RAMs and SRAMs mapped on AXIM interface
- The System memory bootloader

The boot loader is located in system memory. It is used to reprogram the Flash memory through a serial interface. Refer to *STM32 microcontroller system memory boot mode* application note (AN2606) for details.

### 3.17 Power supply schemes

- $V_{DD} = 1.7$  to  $3.6$  V: external power supply for I/Os and the internal regulator (when enabled), provided externally through  $V_{DD}$  pins.
- $V_{SSA}$ ,  $V_{DDA} = 1.7$  to  $3.6$  V: external analog power supplies for ADC, DAC, Reset blocks, RCs and PLL.  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$ , respectively.
- $V_{BAT} = 1.65$  to  $3.6$  V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present.

*Note:*  $V_{DD}/V_{DDA}$  minimum value of 1.7 V is obtained when the internal reset is OFF (refer to [Section 3.18.2: Internal reset OFF](#)). Refer to [Table 3: Voltage regulator configuration mode versus device operating mode](#) to identify the packages supporting this option.

- $V_{DDSDMMC}$  can be connected either to  $V_{DD}$  or an external independent power supply (1.8 to 3.6V) for SDMMC2 pins (clock, command, and 4-bit data). For example, when the device is powered at 1.8V, an independent power supply 2.7V can be connected to  $V_{DDSDMMC}$ . When the  $V_{DDSDMMC}$  is connected to a separated power supply, it is independent from  $V_{DD}$  or  $V_{DDA}$  but it must be the last supply to be provided and the first to disappear. The following conditions  $V_{DDSDMMC}$  must be respected:
  - During the power-on phase ( $V_{DD} < V_{DD\_MIN}$ ),  $V_{DDSDMMC}$  should be always lower than  $V_{DD}$
  - During the power-down phase ( $V_{DD} < V_{DD\_MIN}$ ),  $V_{DDSDMMC}$  should be always lower than  $V_{DD}$
  - The  $V_{DDSDMMC}$  rising and falling time rate specifications must be respected
  - In operating mode phase,  $V_{DDSDMMC}$  could be lower or higher than  $V_{DD}$ : All associated GPIOs powered by  $V_{DDSDMMC}$  are operating between  $V_{DDSDMMC\_MIN}$  and  $V_{DDSDMMC\_MAX}$ .
- $V_{DDUSB}$  can be connected either to  $V_{DD}$  or an external independent power supply (3.0 to 3.6V) for USB transceivers (refer to [Figure 4](#) and [Figure 5](#)). For example, when the device is powered at 1.8V, an independent power supply 3.3V can be connected to  $V_{DDUSB}$ . When the  $V_{DDUSB}$  is connected to a separated power supply, it is independent from  $V_{DD}$  or  $V_{DDA}$  but it must be the last supply to be provided and the first to

disappear. The following conditions  $V_{DDUSB}$  must be respected:

- During the power-on phase ( $V_{DD} < V_{DD\_MIN}$ ),  $V_{DDUSB}$  should be always lower than  $V_{DD}$
- During the power-down phase ( $V_{DD} < V_{DD\_MIN}$ ),  $V_{DDUSB}$  should be always lower than  $V_{DD}$
- The  $V_{DDUSB}$  rising and falling time rate specifications must be respected
- In operating mode phase,  $V_{DDUSB}$  could be lower or higher than  $V_{DD}$ :
  - If USB (USB OTG\_HS/OTG\_FS) is used, the associated GPIOs powered by  $V_{DDUSB}$  are operating between  $V_{DDUSB\_MIN}$  and  $V_{DDUSB\_MAX}$ .
  - The  $V_{DDUSB}$  supply both USB transceiver (USB OTG\_HS and USB OTG\_FS). If only one USB transceiver is used in the application, the GPIOs associated to the other USB transceiver are still supplied by  $V_{DDUSB}$ .
  - If USB (USB OTG\_HS/OTG\_FS) is not used, the associated GPIOs powered by  $V_{DDUSB}$  are operating between  $V_{DD\_MIN}$  and  $V_{DD\_MAX}$ .

**Figure 4.  $V_{DDUSB}$  connected to  $V_{DD}$  power supply**

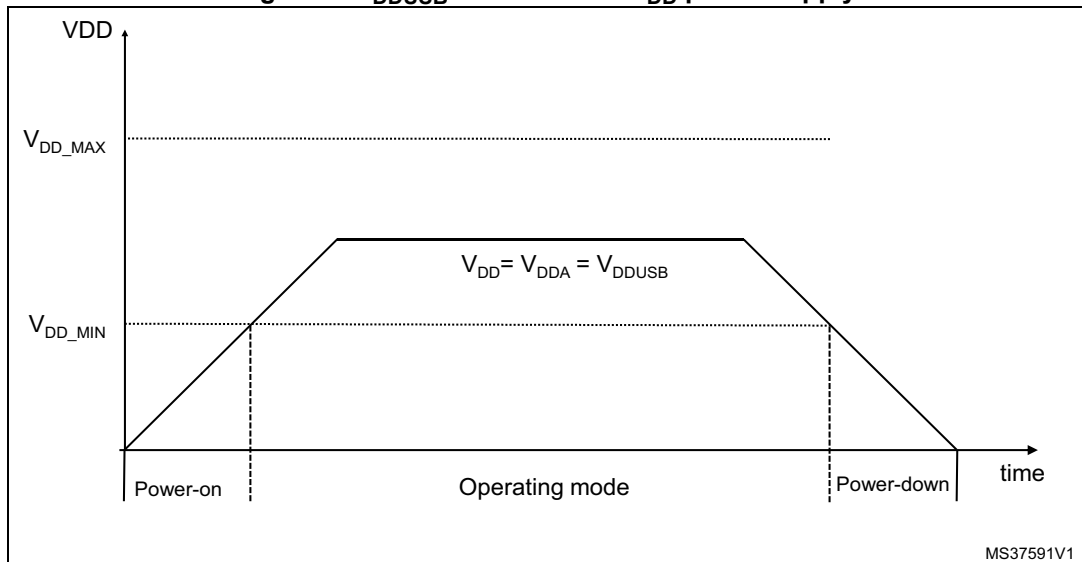

Figure 5.  $V_{DDUSB}$  connected to external power supply

The DSI (Display Serial Interface) sub-system uses several power supply pins which are independent from the other supply pins:

- $V_{DDDSI}$  is an independent DSI power supply dedicated for DSI Regulator and MIPI D-PHY. This supply must be connected to global  $V_{DD}$ .
- The  $V_{CAPDSI}$  pin is the output of DSI Regulator (1.2V) which must be connected externally to  $V_{DD12DSI}$ .
- The  $V_{DD12DSI}$  pin is used to supply the MIPI D-PHY, and to supply the clock and data lanes pins. An external capacitor of 2.2  $\mu F$  must be connected on the  $V_{DD12DSI}$  pin.
- The  $V_{SSDSI}$  pin is an isolated supply ground used for DSI sub-system.
- If the DSI functionality is not used at all, then:
  - The  $V_{DDDSI}$  pin must be connected to global  $V_{DD}$ .
  - The  $V_{CAPDSI}$  pin must be connected externally to  $V_{DD12DSI}$  but the external capacitor is no more needed.
  - The  $V_{SSDSI}$  pin must be grounded.

## 3.18 Power supply supervisor

### 3.18.1 Internal reset ON

On packages embedding the PDR\_ON pin, the power supply supervisor is enabled by holding PDR\_ON high. On the other packages, the power supply supervisor is always enabled.

The device has an integrated power-on reset (POR)/ power-down reset (PDR) circuitry coupled with a Brownout reset (BOR) circuitry. At power-on, POR/PDR is always active and ensures proper operation starting from 1.8 V. After the 1.8 V POR threshold level is reached, the option byte loading process starts, either to confirm or modify default BOR thresholds, or to disable BOR permanently. Three BOR thresholds are available through

option bytes. The device remains in reset mode when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$  or  $V_{BOR}$ , without the need for an external reset circuit.

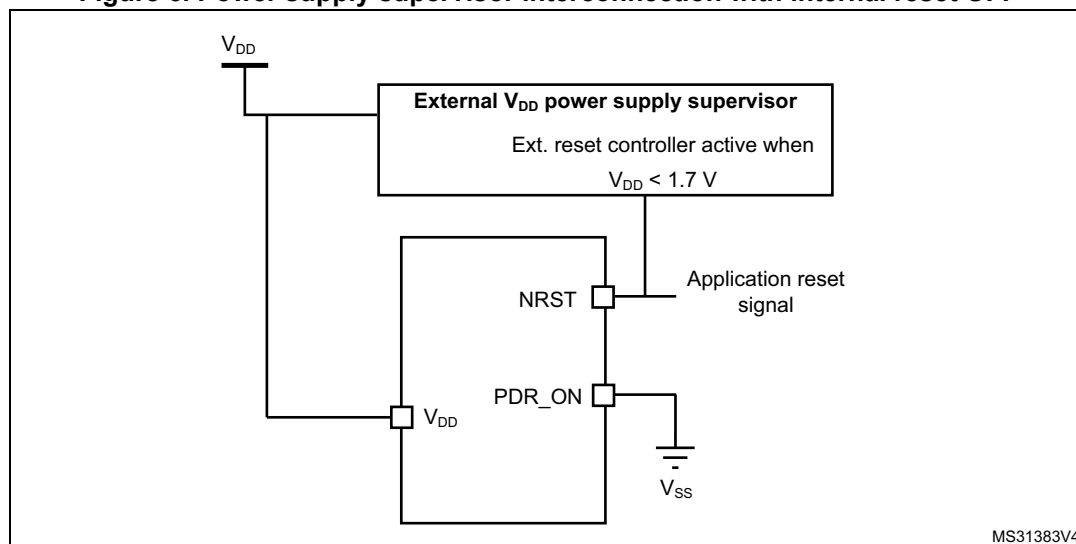

The device also features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. An interrupt can be generated when  $V_{DD}/V_{DDA}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}/V_{DDA}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.18.2 Internal reset OFF

This feature is available only on packages featuring the PDR\_ON pin. The internal power-on reset (POR) / power-down reset (PDR) circuitry is disabled through the PDR\_ON pin.

An external power supply supervisor should monitor  $V_{DD}$  and NRST and should maintain the device in reset mode as long as  $V_{DD}$  is below a specified threshold. PDR\_ON should be connected to  $V_{SS}$ . Refer to [Figure 6: Power supply supervisor interconnection with internal reset OFF](#).

**Figure 6. Power supply supervisor interconnection with internal reset OFF**

The  $V_{DD}$  specified threshold, below which the device must be maintained under reset, is 1.7 V (see [Figure 7](#)).

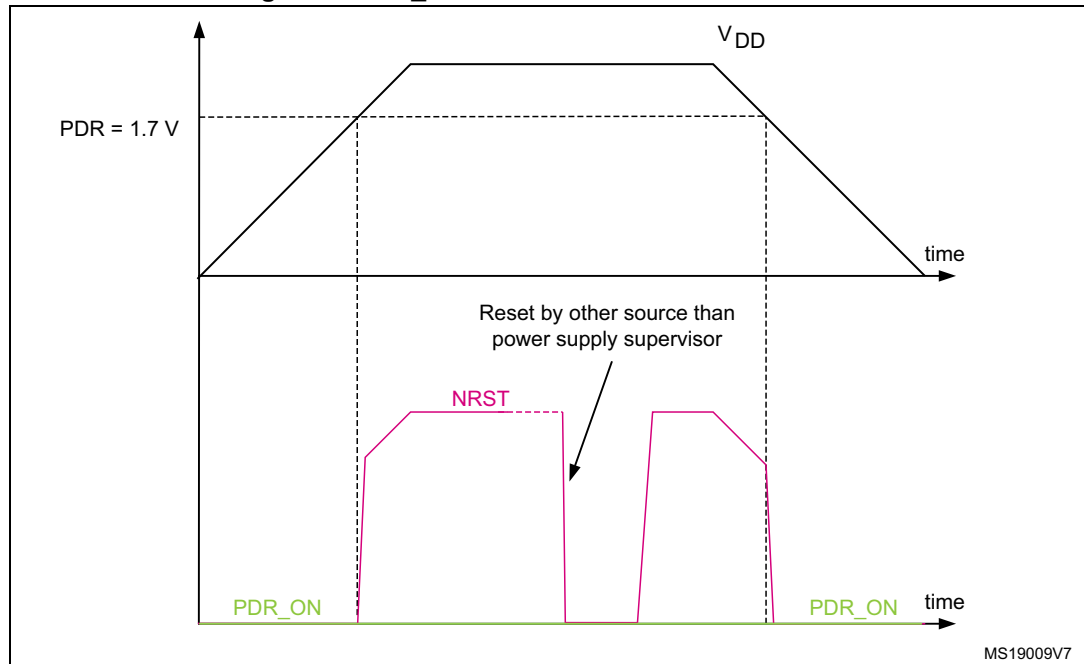

A comprehensive set of power-saving mode allows to design low-power applications.

When the internal reset is OFF, the following integrated features are no more supported:

- The integrated power-on reset (POR) / power-down reset (PDR) circuitry is disabled
- The brownout reset (BOR) circuitry must be disabled
- The embedded programmable voltage detector (PVD) is disabled
- $V_{BAT}$  functionality is no more available and  $V_{BAT}$  pin should be connected to  $V_{DD}$ .

All the packages, except for the LQFP100, allow to disable the internal reset through the PDR\_ON signal when connected to  $V_{SS}$ .

Figure 7. PDR\_ON control with internal reset OFF

### 3.19 Voltage regulator

The regulator has four operating modes:

- Regulator ON
  - Main regulator mode (MR)
  - Low power regulator (LPR)
  - Power-down
- Regulator OFF

#### 3.19.1 Regulator ON

On packages embedding the `BYPASS_REG` pin, the regulator is enabled by holding `BYPASS_REG` low. On all other packages, the regulator is always enabled.

There are three power modes configured by software when the regulator is ON:

- MR mode used in Run/sleep modes or in Stop modes
  - In Run/Sleep modes
 

The MR mode is used either in the normal mode (default mode) or the over-drive mode (enabled by software). Different voltages scaling are provided to reach the best compromise between maximum frequency and dynamic power consumption. The over-drive mode allows operating at a higher frequency than the normal mode for a given voltage scaling.
  - In Stop modes
 

The MR can be configured in two ways during stop mode:  
 MR operates in normal mode (default mode of MR in stop mode)  
 MR operates in under-drive mode (reduced leakage mode).

- LPR is used in the Stop modes:  
 The LP regulator mode is configured by software when entering Stop mode.  
 Like the MR mode, the LPR can be configured in two ways during stop mode:
  - LPR operates in normal mode (default mode when LPR is ON)
  - LPR operates in under-drive mode (reduced leakage mode).
- Power-down is used in Standby mode.  
 The Power-down mode is activated only when entering in Standby mode. The regulator output is in high impedance and the kernel circuitry is powered down, inducing zero consumption. The contents of the registers and SRAM are lost.

Refer to [Table 3](#) for a summary of voltage regulator modes versus device operating modes.

Two external ceramic capacitors should be connected on V<sub>CAP\_1</sub> and V<sub>CAP\_2</sub> pin.

All packages have the regulator ON feature.

**Table 3. Voltage regulator configuration mode versus device operating mode<sup>(1)</sup>**

Voltage regulator configuration	Run mode	Sleep mode	Stop mode	Standby mode
Normal mode	MR	MR	MR or LPR	-
Over-drive mode <sup>(2)</sup>	MR	MR	-	-
Under-drive mode	-	-	MR or LPR	-
Power-down mode	-	-	-	Yes

1. '-' means that the corresponding configuration is not available.
2. The over-drive mode is not available when V<sub>DD</sub> = 1.7 to 2.1 V.

### 3.19.2 Regulator OFF

This feature is available only on packages featuring the BYPASS\_REG pin. The regulator is disabled by holding BYPASS\_REG high. The regulator OFF mode allows to supply externally a V<sub>12</sub> voltage source through V<sub>CAP\_1</sub> and V<sub>CAP\_2</sub> pins.

Since the internal voltage scaling is not managed internally, the external voltage value must be aligned with the targeted maximum frequency. The two 2.2 µF ceramic capacitors should be replaced by two 100 nF decoupling capacitors.

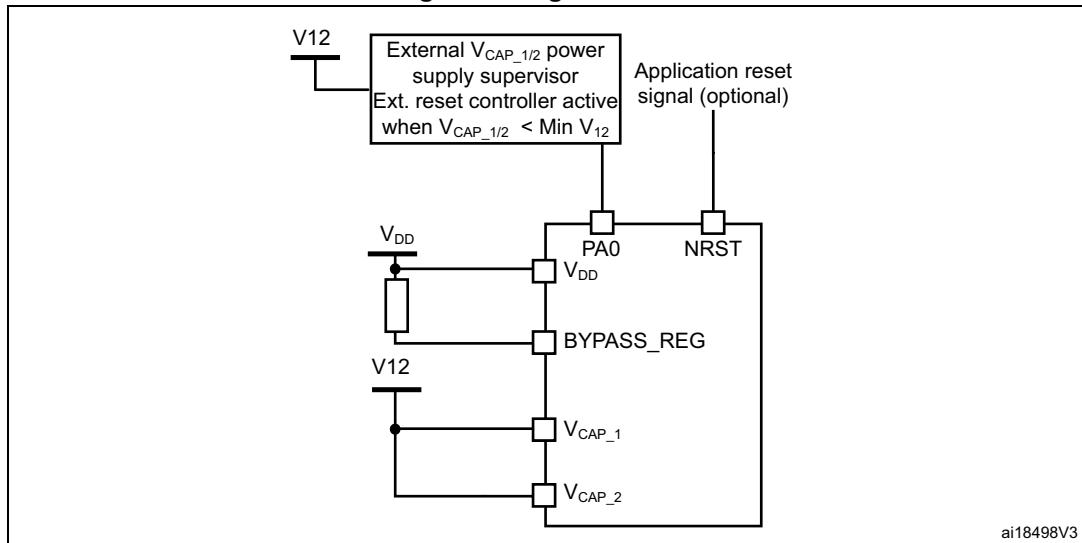

When the regulator is OFF, there is no more internal monitoring on V<sub>12</sub>. An external power supply supervisor should be used to monitor the V<sub>12</sub> of the logic power domain. PA0 pin should be used for this purpose, and act as power-on reset on V<sub>12</sub> power domain.

In the regulator OFF mode, the following features are no more supported:

- PA0 cannot be used as a GPIO pin since it allows to reset a part of the V<sub>12</sub> logic power domain which is not reset by the NRST pin.
- As long as PA0 is kept low, the debug mode cannot be used under power-on reset. As a consequence, PA0 and NRST pins must be managed separately if the debug connection under reset or pre-reset is required.
- The over-drive and under-drive modes are not available.
- The Standby mode is not available.

Figure 8. Regulator OFF

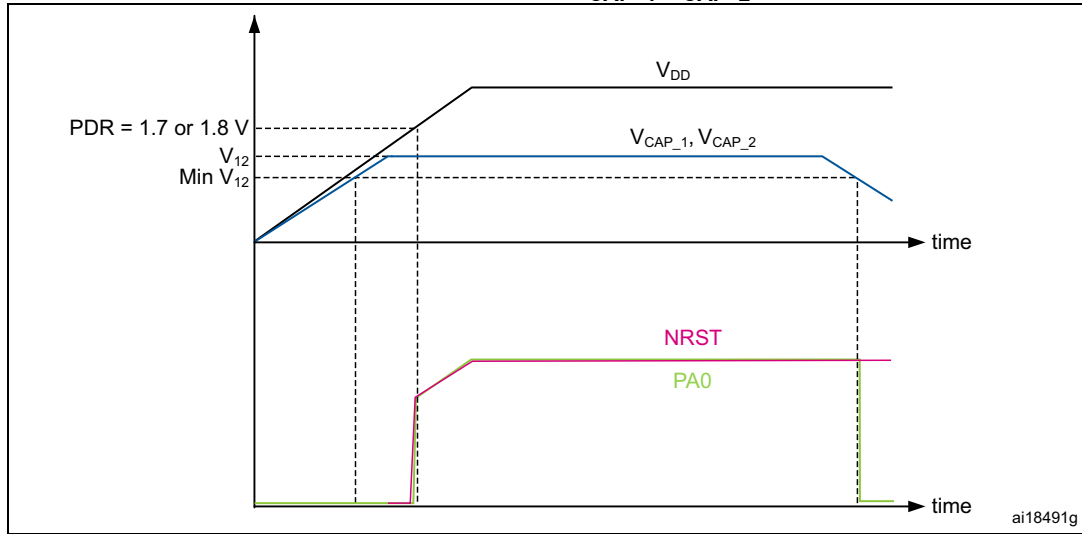

The following conditions must be respected:

- $V_{DD}$  should always be higher than  $V_{CAP\_1}$  and  $V_{CAP\_2}$  to avoid current injection between power domains.
- If the time for  $V_{CAP\_1}$  and  $V_{CAP\_2}$  to reach  $V_{12}$  minimum value is faster than the time for  $V_{DD}$  to reach 1.7 V, then PA0 should be kept low to cover both conditions: until  $V_{CAP\_1}$  and  $V_{CAP\_2}$  reach  $V_{12}$  minimum value and until  $V_{DD}$  reaches 1.7 V (see [Figure 9](#)).
- Otherwise, if the time for  $V_{CAP\_1}$  and  $V_{CAP\_2}$  to reach  $V_{12}$  minimum value is slower than the time for  $V_{DD}$  to reach 1.7 V, then PA0 could be asserted low externally (see [Figure 10](#)).
- If  $V_{CAP\_1}$  and  $V_{CAP\_2}$  go below  $V_{12}$  minimum value and  $V_{DD}$  is higher than 1.7 V, then a reset must be asserted on PA0 pin.

*Note:* The minimum value of  $V_{12}$  depends on the maximum frequency targeted in the application.

## 3.20 Real-time clock (RTC), backup SRAM and backup registers

The RTC is an independent BCD timer/counter. It supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Two programmable alarms.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision.
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy.
- Three anti-tamper detection pins with programmable filter.
- Timestamp feature which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event, or by a switch to V<sub>BAT</sub> mode.
- 17-bit auto-reload wakeup timer (WUT) for periodic events with programmable resolution and period.

The RTC and the 32 backup registers are supplied through a switch that takes power either from the V<sub>DD</sub> supply when present or from the V<sub>BAT</sub> pin.

The backup registers are 32-bit registers used to store 128 bytes of user application data when V<sub>DD</sub> power is not present. They are not reset by a system or power reset, or when the device wakes up from Standby mode.

The RTC clock sources can be:

- A 32.768 kHz external crystal (LSE)
- An external resonator or oscillator(LSE)
- The internal low power RC oscillator (LSI, with typical frequency of 32 kHz)
- The high-speed external clock (HSE) divided by 32

The RTC is functional in  $V_{BAT}$  mode and in all low-power modes when it is clocked by the LSE. When clocked by the LSI, the RTC is not functional in  $V_{BAT}$  mode, but is functional in all low-power modes.

All RTC events (Alarm, WakeUp Timer, Timestamp or Tamper) can generate an interrupt and wakeup the device from the low-power modes.

### 3.21 Low-power modes

The devices support three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- **Stop mode**

The Stop mode achieves the lowest power consumption while retaining the contents of SRAM and registers. All clocks in the 1.2 V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled.

The voltage regulator can be put either in main regulator mode (MR) or in low-power mode (LPR). Both modes can be configured as follows (see [Table 5: Voltage regulator modes in stop mode](#)):

- Normal mode (default mode when MR or LPR is enabled)
- Under-drive mode.

The device can be woken up from the Stop mode by any of the EXTI line (the EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm / wakeup / tamper / time stamp events, the USB OTG FS/HS wakeup or the Ethernet wakeup and LPTIM1 asynchronous interrupt).

**Table 5. Voltage regulator modes in stop mode**

Voltage regulator configuration	Main regulator (MR)	Low-power regulator (LPR)
Normal mode	MR ON	LPR ON
Under-drive mode	MR in under-drive mode	LPR in under-drive mode

- **Standby mode**

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.2 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering

Standby mode, the SRAM and register contents are lost except for registers in the backup domain and the backup SRAM when selected.

The device exits the Standby mode when an external reset (NRST pin), an IWDG reset, a rising or falling edge on one of the 6 WKUP pins (PA0, PA2, PC1, PC13, PI8, PI11), or an RTC alarm / wakeup / tamper /time stamp event occurs.

The Standby mode is not supported when the embedded voltage regulator is bypassed and the 1.2 V domain is controlled by an external power.

### 3.22 $V_{BAT}$ operation

The  $V_{BAT}$  pin allows to power the device  $V_{BAT}$  domain from an external battery, an external supercapacitor, or from  $V_{DD}$  when no external battery and an external supercapacitor are present.

$V_{BAT}$  operation is activated when  $V_{DD}$  is not present.

The  $V_{BAT}$  pin supplies the RTC, the backup registers and the backup SRAM.

*Note:* When the microcontroller is supplied from  $V_{BAT}$ , external interrupts and RTC alarm/events do not exit it from  $V_{BAT}$  operation.

*When the PDR\_ON pin is connected to  $V_{SS}$  (Internal Reset OFF), the  $V_{BAT}$  functionality is no more available and the  $V_{BAT}$  pin should be connected to  $V_{DD}$ .*

### 3.23 Timers and watchdogs

The devices include two advanced-control timers, eight general-purpose timers, two basic timers and two watchdog timers.

All timer counters can be frozen in debug mode.

[Table 6](#) compares the features of the advanced-control, general-purpose and basic timers.

Table 6. Timer feature comparison

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary output	Max interface clock (MHz)	Max timer clock (MHz) <sup>(1)</sup>
Advanced -control	TIM1, TIM8	16-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	Yes	108	216
General purpose	TIM2, TIM5	32-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	No	54	108/216
	TIM3, TIM4	16-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	No	54	108/216

	TIM12	16-bit	Up	Any integer between 1 and 65536	No	2	No	54	108/216
	TIM13, TIM14	16-bit	Up	Any integer between 1 and 65536	No	1	No	54	108/216
Basic	TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No	54	108/216

1. The maximum timer clock is either 108 or 216 MHz depending on TIMPRE bit configuration in the RCC\_DCKCFGR register.

### 3.23.1 Advanced-control timers (TIM1, TIM8)

The advanced-control timers (TIM1, TIM8) can be seen as three-phase PWM generators multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead times. They can also be considered as complete general-purpose timers. Their 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge- or center-aligned modes)
- One-pulse mode output

If configured as standard 16-bit timers, they have the same features as the general-purpose TIMx timers. If configured as 16-bit PWM generators, they have full modulation capability (0-100%).

The advanced-control timer can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

TIM1 and TIM8 support independent DMA request generation.

### 3.23.2 General-purpose timers (TIMx)

There are ten synchronizable general-purpose timers embedded in the STM32F76xxx devices (see [Table 6](#) for differences).

- **TIM2, TIM3, TIM4, TIM5**

The STM32F76xxx include 4 full-featured general-purpose timers: TIM2, TIM5, TIM3, and TIM4. The TIM2 and TIM5 timers are based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler. The TIM3 and TIM4 timers are based on a 16-bit auto-reload up/downcounter and a 16-bit prescaler. They all feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. This gives up to 16 input capture/output compare/PWMs on the largest packages.

The TIM2, TIM3, TIM4, TIM5 general-purpose timers can work together, or with the other general-purpose timers and the advanced-control timers TIM1 and TIM8 via the Timer Link feature for synchronization or event chaining.

Any of these general-purpose timers can be used to generate PWM outputs.

TIM2, TIM3, TIM4, TIM5 all have independent DMA request generation. They are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 4 hall-effect sensors.

- **TIM9, TIM10, TIM11, TIM12, TIM13, and TIM14**

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM10, TIM11, TIM13, and TIM14 feature one independent channel, whereas TIM9 and TIM12 have two independent channels for input capture/output compare, PWM or one-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers. They can also be used as simple time bases.

### 3.23.3 Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger and waveform generation. They can also be used as a generic 16-bit time base.

TIM6 and TIM7 support independent DMA request generation.

### 3.23.4 Low-power timer (LPTIM1)

The low-power timer has an independent clock and is running also in Stop mode if it is clocked by LSE, LSI or an external clock. It is able to wakeup the devices from Stop mode.

This low-power timer supports the following features:

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output: pulse, PWM
- Continuous / one-shot mode
- Selectable software / hardware input trigger
- Selectable clock source:
  - Internal clock source: LSE, LSI, HSI or APB clock
  - External clock source over LPTIM input (working even with no internal clock source running, used by the Pulse Counter Application)
- Programmable digital glitch filter
- Encoder mode

### 3.23.5 Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes.

### 3.23.6 Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### 3.23.7 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard downcounter. It features:

- A 24-bit downcounter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source

### 3.24 Inter-integrated circuit interface (I<sup>2</sup>C)

The devices embed 4 I2C. Refer to table [Table 7: I2C implementation](#) for the features implementation.

The I<sup>2</sup>C bus interface handles communications between the microcontroller and the serial I<sup>2</sup>C bus. It controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing.

The I2C peripheral supports:

- I<sup>2</sup>C-bus specification and user manual rev. 5 compatibility:
  - Slave and master modes, multimaster capability
  - Standard-mode (Sm), with a bitrate up to 100 kbit/s
  - Fast-mode (Fm), with a bitrate up to 400 kbit/s
  - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
  - 7-bit and 10-bit addressing mode, multiple 7-bit slave addresses
  - Programmable setup and hold times
  - Optional clock stretching
- System Management Bus (SMBus) specification rev 2.0 compatibility:
  - Hardware PEC (Packet Error Checking) generation and verification with ACK control
  - Address resolution protocol (ARP) support
  - SMBus alert
- Power System Management Protocol (PMBus™) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent from the PCLK reprogramming.
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

**Table 7. I2C implementation**

I2C features <sup>(1)</sup>	I2C1	I2C2	I2C3	I2C4

### 3.25 Universal synchronous/asynchronous receiver transmitters (USART)

The devices embed USART. Refer to [Table 8: USART implementation](#) for the features implementation.

The universal synchronous asynchronous receiver transmitter (USART) offers a flexible means of full-duplex data exchange with external equipment requiring an industry standard NRZ asynchronous serial data format.

The USART peripheral supports:

- Full-duplex asynchronous communications
- Configurable oversampling method by 16 or 8 to give flexibility between speed and clock tolerance
- Dual clock domain allowing convenient baud rate programming independent from the PCLK reprogramming
- A common programmable transmit and receive baud rate of up to 27 Mbit/s when the USART clock source is system clock frequency (max is 216 MHz) and oversampling by 8 is used.
- Auto baud rate detection
- Programmable data word length (7 or 8 or 9 bits) word length
- Programmable data order with MSB-first or LSB-first shifting
- Programmable parity (odd, even, no parity)
- Configurable stop bits (1 or 1.5 or 2 stop bits)
- Synchronous mode and clock output for synchronous communications
- Single-wire half-duplex communications
- Separate signal polarity control for transmission and reception
- Swappable Tx/Rx pin configuration
- Hardware flow control for modem and RS-485 transceiver
- Multiprocessor communications
- LIN master synchronous break send capability and LIN slave break detection capability
- IrDA SIR encoder decoder supporting 3/16 bit duration for normal mode
- Smartcard mode ( T=0 and T=1 asynchronous protocols for Smartcards as defined in the ISO/IEC 7816-3 standard )
- Support for Modbus communication

[Table 8](#) summarizes the implementation of all U(S)ARTs instances

### 3.26 Serial peripheral interface (SPI)/inter- integrated sound interfaces (I2S)

The devices feature up to six SPIs in slave and master modes in full-duplex and simplex communication modes. SPI1, SPI4, SPI5, and SPI6 can communicate at up to 54 Mbits/s, SPI2 and SPI3 can communicate at up to 25 Mbit/s. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable from 4 to 16 bits. The SPI interfaces support NSS pulse mode, TI mode and Hardware CRC calculation. All the SPIs can be served by the DMA controller.

Three standard I<sup>2</sup>S interfaces (multiplexed with SPI1, SPI2 and SPI3) are available. They can be operated in master or slave mode, in simplex communication modes, and can be configured to operate with a 16-/32-bit resolution as an input or output channel. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both of the I<sup>2</sup>S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

All I2Sx can be served by the DMA controller.

### 3.27 Serial audio interface (SAI)

The devices embed two serial audio interfaces.

The serial audio interface is based on two independent audio subblocks which can operate as transmitter or receiver with their FIFO. Many audio protocols are supported by each block: I2S standards, LSB or MSB-justified, PCM/DSP, TDM, AC'97 and SPDIF output, supporting audio sampling frequencies from 8 kHz up to 192 kHz. Both subblocks can be configured in master or in slave mode.

In master mode, the master clock can be output to the external DAC/CODEC at 256 times of the sampling frequency.

The two sub-blocks can be configured in synchronous mode when full-duplex mode is required.

SAI1 and SAI2 can be served by the DMA controller

### 3.28 SPDIFRX Receiver Interface (SPDIFRX)

The SPDIFRX peripheral, is designed to receive an S/PDIF flow compliant with IEC-60958 and IEC-61937. These standards support simple stereo streams up to high sample rate, and compressed multi-channel surround sound, such as those defined by Dolby or DTS (up to 5.1).

The main features of the SPDIFRX are the following:

- Up to 4 inputs available
- Automatic symbol rate detection
- Maximum symbol rate: 12.288 MHz
- Stereo stream from 32 to 192 kHz supported
- Supports Audio IEC-60958 and IEC-61937, consumer applications
- Parity bit management
- Communication using DMA for audio samples
- Communication using DMA for control and user channel information
- Interrupt capabilities

The SPDIFRX receiver provides all the necessary features to detect the symbol rate, and decode the incoming data stream. The user can select the wanted SPDIF input, and when a valid signal is available, the SPDIFRX re-samples the incoming signal, decodes the manchester stream, recognizes frames, sub-frames and blocks elements. It delivers to the CPU decoded data, and associated status flags.

The SPDIFRX also offers a signal named `spdif_frame_sync`, which toggles at the S/PDIF sub-frame rate that is used to compute the exact sample rate for clock drift algorithms.

### 3.29 Audio PLL (PLLI2S)

The devices feature an additional dedicated PLL for audio I<sup>2</sup>S and SAI applications. It allows to achieve error-free I<sup>2</sup>S sampling clock accuracy without compromising on the CPU performance, while using USB peripherals.

The PLLI2S configuration can be modified to manage an I<sup>2</sup>S/SAI sample rate change without disabling the main PLL (PLL) used for CPU, USB and Ethernet interfaces.

The audio PLL can be programmed with very low error to obtain sampling rates ranging from 8 KHz to 192 KHz.

In addition to the audio PLL, a master clock input pin can be used to synchronize the I<sup>2</sup>S/SAI flow with an external PLL (or Codec output).

### 3.30 Audio and LCD PLL (PLLSAI)

An additional PLL dedicated to audio and LCD-TFT is used for SAI1 peripheral in case the PLLI2S is programmed to achieve another audio sampling frequency (49.152 MHz or 11.2896 MHz) and the audio application requires both sampling frequencies simultaneously.

The PLLSAI is also used to generate the LCD-TFT clock.

### 3.31 SD/SDIO/MMC card host interface (SDMMC)

SDMMC host interfaces are available, that support the MultiMediaCard System Specification Version 4.2 in three different databus modes: 1-bit (default), 4-bit and 8-bit.

The interface allows data transfer at up to 50 MHz, and is compliant with the SD Memory Card Specification Version 2.0.

The SDMMC Card Specification Version 2.0 is also supported with two different databus modes: 1-bit (default) and 4-bit.

The current version supports only one SD/SDMMC/MMC4.2 card at any one time and a stack of MMC4.1 or previous.

The SDMMC can be served by the DMA controller

### 3.32 Ethernet MAC interface with dedicated DMA and IEEE 1588 support

The devices provide an IEEE-802.3-2002-compliant media access controller (MAC) for ethernet LAN communications through an industry-standard medium-independent interface (MII) or a reduced medium-independent interface (RMII). The microcontroller requires an external physical interface device (PHY) to connect to the physical LAN bus (twisted-pair, fiber, etc.). The PHY is connected to the device MII port using 17 signals for MII or 9 signals for RMII, and can be clocked using the 25 MHz (MII) from the microcontroller.

The devices include the following features:

- Supports 10 and 100 Mbit/s rates
- Dedicated DMA controller allowing high-speed transfers between the dedicated SRAM and the descriptors
- Tagged MAC frame support (VLAN support)
- Half-duplex (CSMA/CD) and full-duplex operation
- MAC control sublayer (control frames) support
- 32-bit CRC generation and removal
- Several address filtering modes for physical and multicast address (multicast and group addresses)
- 32-bit status code for each transmitted or received frame
- Internal FIFOs to buffer transmit and receive frames. The transmit FIFO and the receive FIFO are both 2 Kbytes.
- Supports hardware PTP (precision time protocol) in accordance with IEEE 1588 2008 (PTP V2) with the time stamp comparator connected to the TIM2 input
- Triggers interrupt when system time becomes greater than target time

### 3.33 Controller area network (bxCAN)

The three CANs are compliant with the 2.0A and B (active) specifications with a bit rate up to 1 Mbit/s. They can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. Each CAN has three transmit mailboxes, two receive FIFOs with 3 stages and 28 shared scalable filter banks (all of them can be used even if one CAN is used). 256 bytes of SRAM are allocated for CAN1 and CAN2. 512 bytes of SRAM are dedicated for CAN3.

### 3.34 Universal serial bus on-the-go full-speed (OTG\_FS)

The devices embed an USB OTG full-speed device/host/OTG peripheral with integrated transceivers. The USB OTG FS peripheral is compliant with the USB 2.0 specification and with the OTG 2.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG controller requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator.

The major features are:

- Combined Rx and Tx FIFO size of 1.28 Kbytes with dynamic FIFO sizing
- Supports the session request protocol (SRP) and host negotiation protocol (HNP)
- 1 bidirectional control endpoint + 5 IN endpoints + 5 OUT endpoints
- 12 host channels with periodic OUT support
- Software configurable to OTG1.3 and OTG2.0 modes of operation
- USB 2.0 LPM (Link Power Management) support
- Battery Charging Specification Revision 1.2 support
- Internal FS OTG PHY support
- HNP/SNP/IP inside (no need for any external resistor)

For the OTG/Host modes, a power switch is needed in case bus-powered devices are connected

### 3.35 Universal serial bus on-the-go high-speed (OTG\_HS)

The devices embed a USB OTG high-speed (up to 480 Mbit/s) device/host/OTG peripheral. The USB OTG HS supports both full-speed and high-speed operations. It integrates the transceivers for full-speed operation (12 Mbit/s) and features a UTMI low-pin interface (ULPI) for high-speed operation (480 Mbit/s). When using the USB OTG HS in HS mode, an external PHY device connected to the ULPI is required.

The USB OTG HS peripheral is compliant with the USB 2.0 specification and with the OTG 2.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG controller requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator.

The major features are:

- Combined Rx and Tx FIFO size of 4 Kbytes with dynamic FIFO sizing
- Supports the session request protocol (SRP) and host negotiation protocol (HNP)
- 8 bidirectional endpoints
- 16 host channels with periodic OUT support

- Software configurable to OTG1.3 and OTG2.0 modes of operation
- USB 2.0 LPM (Link Power Management) support
- Battery Charging Specification Revision 1.2 support
- Internal FS OTG PHY support
- External HS or HS OTG operation supporting ULPI in SDR mode. The OTG PHY is connected to the microcontroller ULPI port through 12 signals. It can be clocked using the 60 MHz output.
- Internal USB DMA
- HNP/SNP/IP inside (no need for any external resistor)
- for OTG/Host modes, a power switch is needed in case bus-powered devices are connected

### 3.36 High-definition multimedia interface (HDMI) - consumer electronics control (CEC)

The devices embed a HDMI-CEC controller that provides hardware support for the Consumer Electronics Control (CEC) protocol (Supplement 1 to the HDMI standard).

This protocol provides high-level control functions between all audiovisual products in an environment. It is specified to operate at low speeds with minimum processing and memory overhead. It has a clock domain independent from the CPU clock, allowing the HDMI-CEC controller to wakeup the MCU from Stop mode on data reception.

### 3.37 Digital camera interface (DCMI)

The devices embed a camera interface that can connect with camera modules and CMOS sensors through an 8-bit to 14-bit parallel interface, to receive video data. The camera interface can sustain a data transfer rate up to 54 Mbytes/s in 8-bit mode at 54 MHz. It features:

- Programmable polarity for the input pixel clock and synchronization signals
- Parallel data communication can be 8-, 10-, 12- or 14-bit
- Supports 8-bit progressive video monochrome or raw bayer format, YCbCr 4:2:2 progressive video, RGB 565 progressive video or compressed data (like JPEG)
- Supports continuous mode or snapshot (a single frame) mode
- Capability to automatically crop the image

### 3.38 Management Data Input/Output (MDIO) slaves

The devices embed a MDIO slave interface it includes the following features:

- 32 MDIO Registers addresses, each of which is managed using separate input and output data registers:
  - 32 x 16-bit firmware read/write, MDIO read-only output data registers
  - 32 x 16-bit firmware read-only, MDIO write-only input data registers
- Configurable slave (port) address
- Independently maskable interrupts/events:
  - MDIO Register write
  - MDIO Register read
  - MDIO protocol error
- Able to operate in and wake up from STOP mode

### 3.39 Random number generator (RNG)

All the devices embed an RNG that delivers 32-bit random numbers generated by an integrated analog circuit.

### 3.40 General-purpose input/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain, with or without pull-up or pull-down), as input (floating, with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current-capable and have speed selection to better manage internal noise, power consumption and electromagnetic emission.

The I/O configuration can be locked if needed by following a specific sequence in order to avoid spurious writing to the I/Os registers.

A fast I/O handling allows a maximum I/O toggling up to 108 MHz.

### 3.41 Analog-to-digital converters (ADCs)

Three 12-bit analog-to-digital converters are embedded and each ADC shares up to 16 external channels, performing conversions in the single-shot or scan mode. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold

The ADC can be served by the DMA controller. An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

To synchronize A/D conversion and timers, the ADCs could be triggered by any of TIM1, TIM2, TIM3, TIM4, TIM5, or TIM8 timer.

### 3.42 Digital filter for Sigma-Delta Modulators (DFSDM)

The devices embed one DFSDM with 4 digital filters modules and 8 external input serial channels (transceivers) or alternately 8 internal parallel inputs support. The DFSDM peripheral is dedicated to interface the external  $\Sigma\Delta$  modulators to microcontroller and then to perform digital filtering of the received data streams (which represent analog value on  $\Sigma\Delta$  modulators inputs). The DFSDM can also interface PDM (Pulse Density Modulation) microphones and perform PDM to PCM conversion and filtering in hardware. The DFSDM features optional parallel data stream inputs from microcontrollers memory (through DMA/CPU transfers into DFSDM). The DFSDM transceivers support several serial interface formats (to support various  $\Sigma\Delta$  modulators). The DFSDM digital filter modules perform digital processing according user selected filter parameters with up to 24-bit final ADC resolution.

The DFSDM peripheral supports:

- 8 multiplexed input digital serial channels:
  - Configurable SPI interface to connect various SD modulator(s)
  - Configurable Manchester coded 1 wire interface support
  - PDM (Pulse Density Modulation) microphone input support
  - Maximum input clock frequency up to 20 MHz (10 MHz for Manchester coding)
  - Clock output for SD modulator(s): 0..20 MHz
- Alternative inputs from 8 internal digital parallel channels (up to 16 bit input resolution):
  - internal sources: device memory data streams (DMA)
- 4 digital filter modules with adjustable digital signal processing:
  - Sincxfilter: filter order/type (1..5), oversampling ratio (up to 1..1024)
  - integrator: oversampling ratio (1..256)
- Up to 24-bit output data resolution, signed output data format
- Automatic data offset correction (offset stored in register by user)
- Continuous or single conversion
- Start-of-conversion triggered by:
  - Software trigger
  - Internal timers
  - External events
  - Start-of-conversion synchronously with first digital filter module (DFSDM0)
- Analog watchdog feature:
  - Low value and high value data threshold registers
  - Dedicated configurable Sincx digital filter (order = 1..3, oversampling ratio = 1..32)
  - Input from final output data or from selected input digital serial channels
  - Continuous monitoring independently from standard conversion
- Short circuit detector to detect saturated analog input values (bottom and top range):
  - Up to 8-bit counter to detect 1..256 consecutive 0's or 1's on serial data stream
  - Monitoring continuously each input serial channel
- Break signal generation on analog watchdog event or on short circuit detector event
- Extremes detector:
  - Storage of minimum and maximum values of final conversion data

- Refreshed by software
- DMA capability to read the final conversion data
- Interrupts: end of conversion, overrun, analog watchdog, short circuit, input serial channel clock absence
- “regular” or “injected” conversions:
  - “regular” conversions can be requested at any time or even in continuous mode without having any impact on the timing of “injected” conversions
  - “injected” conversions for precise timing and with high conversion priority

### 3.43 Temperature sensor

The temperature sensor has to generate a voltage that varies linearly with the temperature. The conversion range is between 1.7 V and 3.6 V. The temperature sensor is internally connected to the same input channel as  $V_{BAT}$ , ADC1\_IN18, which is used to convert the sensor output voltage into a digital value. When the temperature sensor and  $V_{BAT}$  conversion are enabled at the same time, only  $V_{BAT}$  conversion is performed.

As the offset of the temperature sensor varies from chip to chip due to process variation, the internal temperature sensor is mainly suitable for applications that detect temperature changes instead of absolute temperatures. If an accurate temperature reading is needed, then an external temperature sensor part should be used.

### 3.44 Digital-to-analog converter (DAC)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs.

This dual digital Interface supports the following features:

- Two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- External triggers for conversion
- Input voltage reference  $V_{REF+}$

Eight DAC trigger inputs are used in the device. The DAC channels are triggered through the timer update outputs that are also connected to different DMA streams.

### 3.45 Serial wire JTAG debug port (SWJ-DP)

The Arm SWJ-DP interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

The debug is performed using 2 pins only instead of 5 required by the JTAG (JTAG pins could be re-use as GPIO with alternate function): the JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

### 3.46 Embedded Trace Macrocell™

The Arm embedded trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F76xxx through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or

any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer that runs the debugger software. TPA hardware is commercially available from common development tool vendors.

The Embedded Trace Macrocell operates with third party debugger software tools.

### 3.47 DSI Host (DSIHOST)

The DSI Host is a dedicated peripheral for interfacing with MIPI<sup>®</sup> DSI compliant displays. It includes a dedicated video interface internally connected to the LTDC and a generic APB interface that can be used to transmit information to the display.

These interfaces are as follows:

- LTDC interface:
  - Used to transmit information in Video mode, in which the transfers from the host processor to the peripheral take the form of a real-time pixel stream (DPI).
  - Through a customized for mode, this interface can be used to transmit information in full bandwidth in the Adapted Command mode (DBI).
- APB slave interface:
  - Allows the transmission of generic information in Command mode, and follows a proprietary register interface.
  - Can operate concurrently with either LTDC interface in either Video mode or Adapted Command mode.
- Video mode pattern generator:
  - Allows the transmission of horizontal/vertical color bar and D-PHY BER testing pattern without any kind of stimuli.

The DSI Host main features:

- Compliant with MIPI<sup>®</sup> Alliance standards
- Interface with MIPI<sup>®</sup> D-PHY
- Supports all commands defined in the MIPI<sup>®</sup> Alliance specification for DCS:
  - Transmission of all Command mode packets through the APB interface
  - Transmission of commands in low-power and high-speed during Video mode
- Supports up to two D-PHY data lanes
- Bidirectional communication and escape mode support through data lane 0
- Supports non-continuous clock in D-PHY clock lane for additional power saving
- Supports Ultra Low-power mode with PLL disabled
- ECC and Checksum capabilities
- Support for End of Transmission Packet (EoTp)
- Fault recovery schemes
- 3D transmission support
- Configurable selection of system interfaces:
  - AMBA APB for control and optional support for Generic and DCS commands
  - Video Mode interface through LTDC
  - Adapted Command mode interface through LTDC
- Independently programmable Virtual Channel ID in

- Video mode
- Adapted Command mode
- APB Slave

**Video Mode interfaces features:**

- LTDC interface color coding mappings into 24-bit interface:
  - 16-bit RGB, configurations 1, 2, and 3
  - 18-bit RGB, configurations 1 and 2
  - 24-bit RGB
- Programmable polarity of all LTDC interface signals
- Maximum resolution is limited by available DSI physical link bandwidth:
  - Number of lanes: 2
  - Maximum speed per lane: 500 Mbps1Gbps

**Adapted interface features**

Support for sending large amounts of data through the memory\_write\_start(WMS) and memory\_write\_continue(WMC) DCS commands

- LTDC interface color coding mappings into 24-bit interface:
  - 16-bit RGB, configurations 1, 2, and 3
  - 18-bit RGB, configurations 1 and 2
  - 24-bit RGB

**Video mode pattern generator:**

- Vertical and horizontal color bar generation without LTDC stimuli
- BER pattern without LTDC stimuli

1. NC (not-connected) pins are not bonded. They must be configured by software to output push-pull and forced to 0 in the output data register to avoid an extra current consumption in low-power modes. list of pins: PI8, PI12, PI13, PI14, PF6, PF7, PF8, PF9, PC2, PC3, PC4, PC5, PI15, PJ0, PJ1, PJ2, PJ3, PJ4, PJ5, PH6, PH7, PJ12, PJ13, PJ14, PJ15, PG14, PK3, PK4, PK5, PK6 and PK7.
2. PC13, PC14, PC15 and PI8 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 and PI8 in output mode is limited: - The speed should not exceed 2 MHz with a maximum load of 30 pF. - These I/Os must not be used as a current source (e.g. to drive an LED).
3. FT = 5 V tolerant except when in analog mode or oscillator mode (for PC14, PC15, PH0 and PH1).
4. If the device is in regulator OFF/internal reset ON mode (BYPASS\_REG pin is set to VDD), then PA0 is used as an internal reset (active low).
5. Internally connected to VDD or VSS depending on part number.

## 5 Memory mapping

Refer to the product line reference manual for details on the memory mapping as well as the boundary addresses for all peripherals.

## 6 Electrical characteristics

### 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 6.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^\circ\text{C}$  and  $T_A = T_{Amax}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\sigma$ ).

#### 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^\circ\text{C}$ ,  $V_{DD} = 3.3\text{ V}$  (for the  $1.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$  voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\sigma$ ).

#### 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 22](#).

#### 6.1.5 Pin input voltage

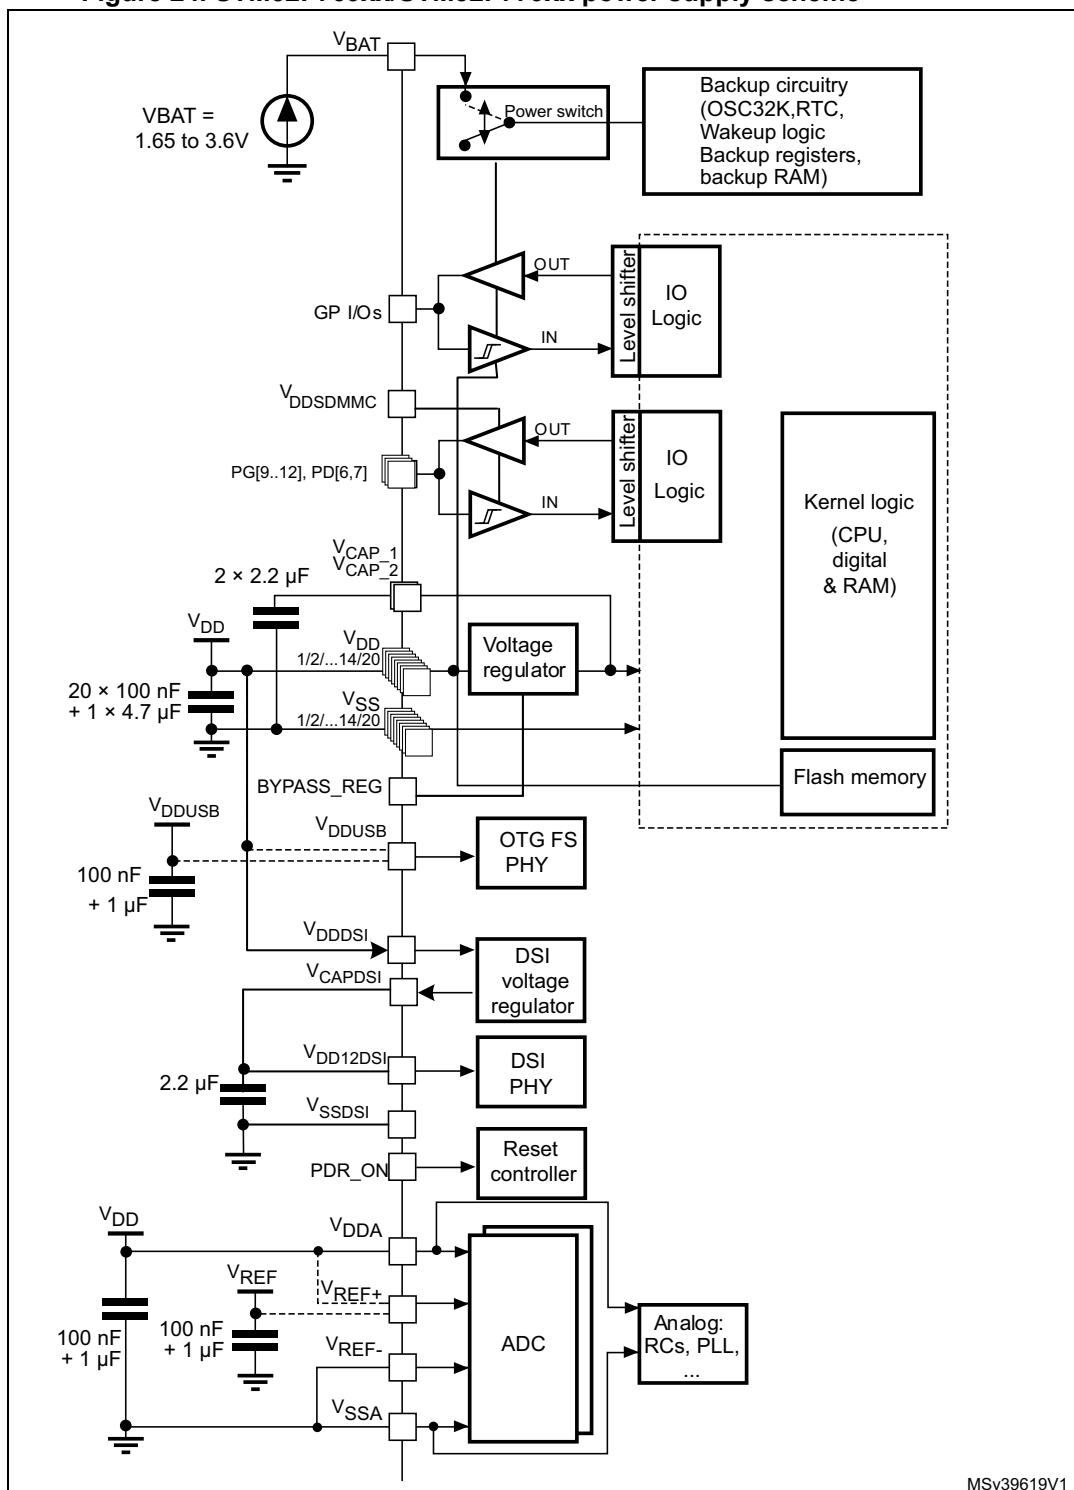

The input voltage measurement on a pin of the device is described in [Figure 23](#).

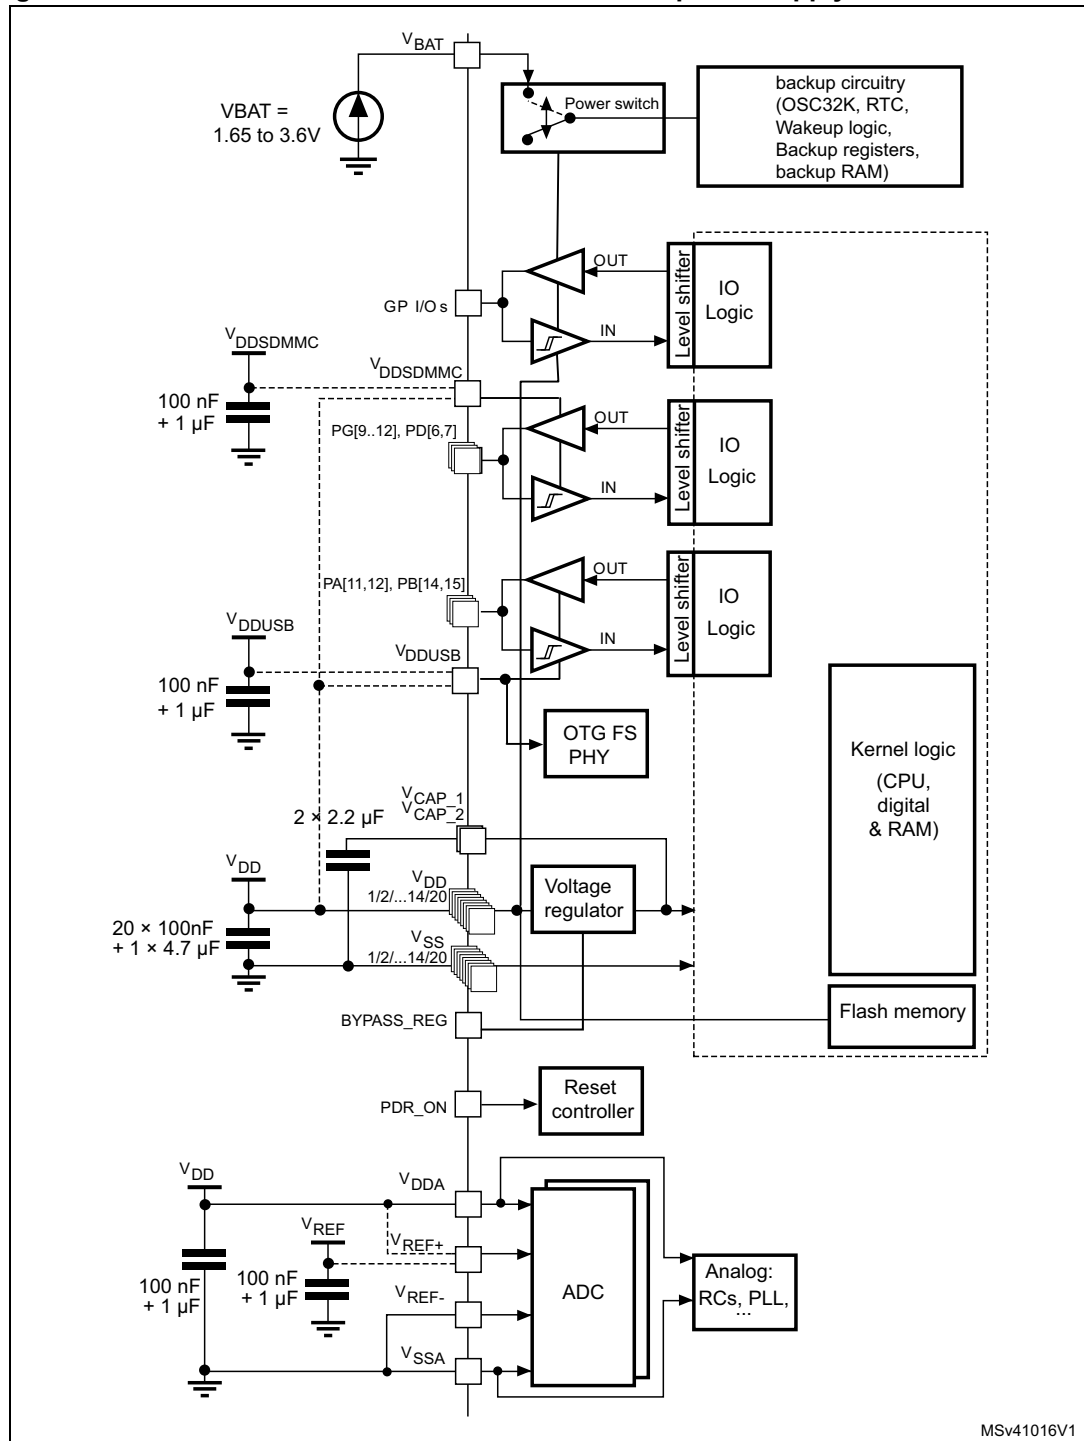

### 6.1.6 Power supply scheme

Figure 24. STM32F769xx/STM32F779xx power supply scheme

MSv39619V1

Figure 25. STM32F765xx/STM32F767xx/STM32F777xx power supply scheme

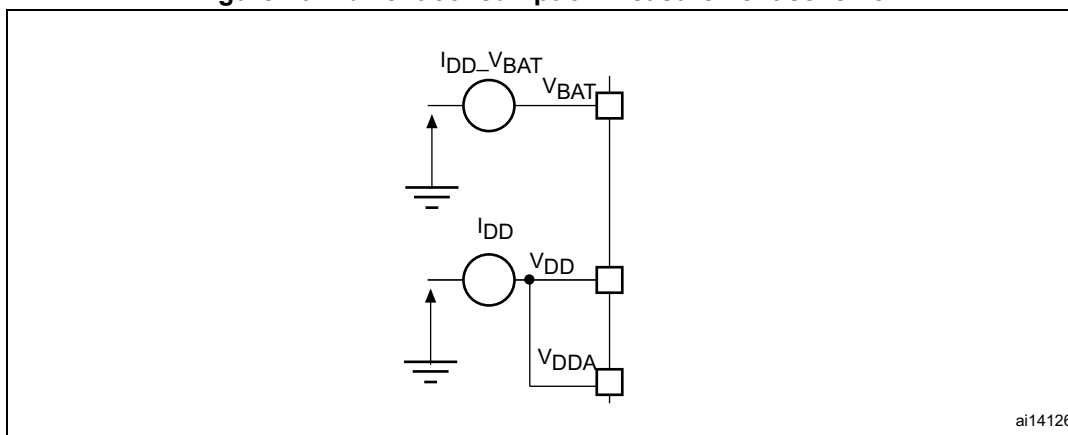

MSv41016V1

1. To connect BYPASS\_REG and PDR\_ON pins, refer to [Section 3.18: Power supply supervisor](#) and [Section 3.19: Voltage regulator](#).
2. The two 2.2 µF ceramic capacitors should be replaced by two 100 nF decoupling capacitors when the voltage regulator is OFF.
3. The 4.7 µF ceramic capacitor must be connected to one of the V<sub>DD</sub> pin.
4. V<sub>DDA</sub>=V<sub>DD</sub> and V<sub>SSA</sub>=V<sub>SS</sub>.

**Caution:** Each power supply pair ( $V_{DD}/V_{SS}$ ,  $V_{DDA}/V_{SSA}$  ...) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure good operation of the device. It is not recommended to remove filtering capacitors to reduce PCB size or cost. This might cause incorrect operation of the device.

### 6.1.7 Current consumption measurement

Figure 26. Current consumption measurement scheme

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 14: Voltage characteristics](#), [Table 15: Current characteristics](#), and [Table 16: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and the functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. The device mission profile (application conditions) is compliant with JEDEC JESD47 Qualification Standard. Extended mission profiles are available on demand.

Table 14. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DD-VSS}$	External main supply voltage (including $V_{DDA}$ , $V_{DD}$ , $V_{BAT}$ , $V_{DDUSB}$ , $V_{DDSI}$ <sup>(1)</sup> and $V_{DDSDMMC}$ ) <sup>(2)</sup>	- 0.3	4.0	V
$V_{IN}$	Input voltage on FT pins <sup>(3)</sup>	$V_{SS} - 0.3$	$V_{DD} + 4.0$

	Input voltage on any other pin	$V_{SS} - 0.3$	4.0	
	Input voltage on BOOT pin	$V_{SS}$	9.0	
$ \Delta V_{DDx} $	Variations between different $V_{DD}$ power pins	-	50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins <sup>(4)</sup>	-	50	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see <a href="#">Section 6.3.18: Absolute maximum ratings (electrical sensitivity)</a>		-

1. Applicable only for STM32F7x9 sales types.
2. All main power ( $V_{DD}$ ,  $V_{DDA}$ ,  $V_{DDSDMMC}$ ,  $V_{DDUSB}$ ,  $V_{DDDSI}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
3.  $V_{IN}$  maximum value must always be respected. Refer to [Table 15](#) for the values of the maximum allowed injected current.
4. Include  $V_{REF}$  pin.

$I_{VDD}$	Maximum current into each $V_{DD\_x}$ power line (source) <sup>(1)</sup>	100	
$I_{VDDSDMMC}$	Maximum current into $V_{DDSDMMC}$ power line (source): PG[12:9], PD[7:6]	100	
$I_{VSS}$	Maximum current out of each $V_{SS\_x}$ ground line (sink) <sup>(1)</sup>	-100	
$I_{IO}$	Output current sunk by any I/O and control pin	25	
	Output current sourced by any I/Os and control pin	-25	
$\Sigma I_{IO}$	Total output current sunk by sum of all I/O and control pins <sup>(2)</sup>	120	
	Total output current sunk by sum of all USB I/Os	25	
	Total output current sunk by sum of all SDMMC I/Os	120	
	Total output current sourced by sum of all I/Os and control pins except USB I/Os <sup>(2)</sup>	-120	
$I_{INJ(PIN)}$	Injected current on FT, FTf, RST and B pins <sup>(3)</sup>	-5/+0	
	Injected current on TTa pins <sup>(4)</sup>	±5	
$\Sigma I_{INJ(PIN)}$ <sup>(4)</sup>	Total injected current (sum of all I/O and control pins) <sup>(5)</sup>	±25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count LQFP packages.
3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. A positive injection is induced by  $V_{IN} > V_{DDA}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 14: Voltage characteristics](#) for the values of the maximum allowed input voltage.
5. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

1. The over-drive mode is not supported at the voltage ranges from 1.7 to 2.1 V.
2. 216 MHz maximum frequency for 6 suffix version (200 MHz maximum frequency for 7 suffix version).
3. V<sub>DD</sub>/V<sub>DDA</sub> minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to [Section 3.18.2: Internal reset OFF](#)).
4. When the ADC is used, refer to [Table 71: ADC characteristics](#).
5. If V<sub>REF+</sub> pin is present, it must respect the following condition: V<sub>DDA</sub>-V<sub>REF+</sub> < 1.2 V.

6. It is recommended to power  $V_{DD}$  and  $V_{DDA}$  from the same source. A maximum difference of 300 mV between  $V_{DD}$  and  $V_{DDA}$  can be tolerated during power-up and power-down operation.
7. The over-drive mode is not supported when the internal regulator is OFF.
8. To sustain a voltage higher than  $V_{DD}+0.3$ , the internal Pull-up and Pull-Down resistors must be disabled
9. If  $T_A$  is lower, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$ .
10. In low power dissipation state,  $T_A$  can be extended to this range as long as  $T_J$  does not exceed  $T_{Jmax}$ .

**Table 18. Limitations depending on the operating power supply range**

Operating power supply range	ADC operation	Maximum Flash memory access frequency with no wait states ( $f_{Flashmax}$ )	Maximum HCLK frequency vs Flash memory wait states (1)(2)	I/O operation	Possible Flash memory operations
$V_{DD} = 1.7$ to $2.1$ V <sup>(3)</sup>	Conversion time up to 1.2 Msps	20 MHz	180 MHz with 8 wait states and over-drive OFF	No I/O compensation	8-bit erase and program operations only
$V_{DD} = 2.1$ to $2.4$ V	Conversion time up to 1.2 Msps	22 MHz	216 MHz with 9 wait states and over-drive ON	No I/O compensation	16-bit erase and program operations
$V_{DD} = 2.4$ to $2.7$ V	Conversion time up to 2.4 Msps	24 MHz	216 MHz with 8 wait states and over-drive ON	I/O compensation works	16-bit erase and program operations
$V_{DD} = 2.7$ to $3.6$ V <sup>(4)</sup>	Conversion time up to 2.4 Msps	30 MHz	216 MHz with 6 wait states and over-drive ON	I/O compensation works	32-bit erase and program operations

1. Applicable only when the code is executed from Flash memory. When the code is executed from RAM, no wait state is required.
2. Thanks to the ART accelerator on ITCM interface and L1-cache on AXI interface, the number of wait states given here does not impact the execution speed from Flash memory since the ART accelerator or L1-cache allows to achieve a performance equivalent to 0-wait state program execution.
3.  $V_{DD}/V_{DDA}$  minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to [Section 3.18.2: Internal reset OFF](#)).
4. The voltage range for USB full speed PHYs can drop down to 2.7 V. However the electrical characteristics of D- and D+ pins are degraded between 2.7 and 3 V.

### 6.3.2 VCAP1/VCAP2 external capacitor

Stabilization for the main regulator is achieved by connecting an external capacitor  $C_{EXT}$  to the VCAP1/VCAP2 pins.  $C_{EXT}$  is specified in [Table 19](#).

**Figure 27. External capacitor  $C_{EXT}$**

1. Guaranteed by design.
2. The reset temporization is measured from the power-on (POR reset or wakeup from V<sub>BAT</sub>) to the instant when first instruction is read by the user application code.

### 6.3.6 Over-drive switching characteristics

When the over-drive mode switches from enabled to disabled or disabled to enabled, the system clock is stalled during the internal voltage set-up.

The over-drive switching characteristics are given in [Table 23](#). They are subject to general operating conditions for T<sub>A</sub>.

**Table 23. Over-drive switching characteristics<sup>(1)</sup>**

		HSE max for 4 MHz and min for 26 MHz.	20	-	80	
		External HSE 50 MHz	-	15	-	

1. Guaranteed by design.

### 6.3.7 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 26: Current consumption measurement scheme](#).

All the run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to CoreMark code.

**Typical and maximum current consumption**

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at V<sub>DD</sub> or V<sub>SS</sub> (no load).
- All peripherals are disabled except if it is explicitly mentioned.
- The Flash memory access time is adjusted both to f<sub>HCLK</sub> frequency and V<sub>DD</sub> range (see [Table 18: Limitations depending on the operating power supply range](#)).
- When the regulator is ON, the voltage scaling and over-drive mode are adjusted to f<sub>HCLK</sub> frequency as follows:
  - Scale 3 for f<sub>HCLK</sub> ≤ 144 MHz
  - Scale 2 for 144 MHz < f<sub>HCLK</sub> ≤ 168 MHz
  - Scale 1 for 168 MHz < f<sub>HCLK</sub> ≤ 216 MHz. The over-drive is only ON at 216 MHz.
- When the regulator is OFF, the V12 is provided externally as described in [Table 17: General operating conditions](#):
- The system clock is HCLK, f<sub>PCLK1</sub> = f<sub>HCLK</sub>/4, and f<sub>PCLK2</sub> = f<sub>HCLK</sub>/2.
- External clock frequency is 25 MHz and PLL is ON when f<sub>HCLK</sub> is higher than 25 MHz.
- The typical current consumption values are obtained for 1.7 V ≤ V<sub>DD</sub> ≤ 3.6 V voltage range and for T<sub>A</sub> = 25 °C unless otherwise specified.
- The maximum values are obtained for 1.7 V ≤ V<sub>DD</sub> ≤ 3.6 V voltage range and a maximum ambient temperature (T<sub>A</sub>) unless otherwise specified.
- For the voltage range 1.7 V ≤ V<sub>DD</sub> ≤ 3.6 V, the maximum frequency is 180 MHz.

### I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

#### I/O static current consumption

All the I/Os used as inputs with pull-up generate a current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 65: I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

An additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid a current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

I/O dynamic current consumption

In addition to the internal peripheral current consumption (see [Table 39: Peripheral current consumption](#)), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DD} \times f_{SW} \times C$$

where

$I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load

$V_{DD}$  is the MCU supply voltage

$f_{SW}$  is the I/O switching frequency

$C$  is the total capacitance seen by the I/O pin:  $C = C_{INT} + C_{EXT}$

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

### On-chip peripheral current consumption

The MCU is placed under the following conditions:

- At startup, all I/O pins are in analog input configuration.
- All peripherals are disabled unless otherwise mentioned.
- I/O compensation cell enabled.
- The ART/L1-cache is ON.
- Scale 1 mode selected, internal digital voltage V<sub>I2</sub> = 1.32 V.
- HCLK is the system clock. f<sub>PCLK1</sub> = f<sub>HCLK</sub>/4, and f<sub>PCLK2</sub> = f<sub>HCLK</sub>/2.

The given value is calculated by measuring the difference of current consumption

- with all peripherals clocked off
- with only one peripheral clocked on
- f<sub>HCLK</sub> = 216 MHz (Scale 1 + over-drive ON), f<sub>HCLK</sub> = 168 MHz (Scale 2), f<sub>HCLK</sub> = 144 MHz (Scale 3)
- Ambient operating temperature is 25 °C and V<sub>DD</sub>=3.3 V.

1. When the I/O compensation cell is ON, I<sub>DD</sub> typical value increases by 0.22 mA.
2. The BusMatrix is automatically active when at least one master is ON.
3. To enable an I2S peripheral, first set the I2SMOD bit and then the I2SE bit in the SPI\_I2SCFGR register.
4. When the DAC is ON and EN1/2 bits are set in DAC\_CR register, add an additional power consumption of 0.75 mA per DAC channel for the analog part.
5. When the ADC is ON (ADON bit set in the ADC\_CR2 register), add an additional power consumption of 1.73 mA per ADC for the analog part.

### 6.3.8 Wakeup time from low-power modes

The wakeup times given in [Table 40](#) are measured starting from the wakeup event trigger up to the first instruction executed by the CPU:

- For Stop or Sleep modes: the wakeup event is WFE.
- WKUP (PA0) pin is used to wakeup from Standby, Stop and Sleep modes.

All timings are derived from tests performed under ambient temperature and  $V_{DD}=3.3\text{ V}$ .

### 6.3.9 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard I/O. The external clock signal has to respect the [Table 65: I/O static characteristics](#). However, the recommended clock input waveform is shown in [Figure 28](#).

The characteristics given in [Table 41](#) result from tests performed using an high-speed external clock source, and under ambient temperature and supply voltage conditions summarized in [Table 17](#).

**Table 41. High-speed external user clock characteristics**

**High-speed external clock generated from a crystal/ceramic resonator**

The high-speed external (HSE) clock can be supplied with a 4 to 26 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 43](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

1. Guaranteed by design.
2. This parameter depends on the crystal used in the application. The minimum and maximum values must be respected to comply with USB standard specifications.
3. t<sub>SU(HSE)</sub> is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is guaranteed by characterization results. It is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 30](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . The PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ .

*Note:* For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

### 6.3.12 PLL spread spectrum clock generation (SSCG) characteristics

The spread spectrum clock generation (SSCG) feature allows to reduce electromagnetic interferences (see [Table 61: EMI characteristics](#)). It is available only on the main PLL.

Table 50. SSCG parameters constraint

Symbol	Parameter	Min	Typ	Max <sup>(1)</sup>	Unit
f <sub>Mod</sub>	Modulation frequency	-	-	10	KHz
md	Peak modulation depth	0.25	-	2	%
MODEPER * INCSTEP	-	-	-	2 <sup>15</sup> - 1	-

1. Guaranteed by design.

Equation 1

The frequency modulation period (MODEPER) is given by the equation below:

$$\text{MODEPER} = \text{round}[f_{\text{PLL\_IN}} / (4 \times f_{\text{Mod}})]$$

f<sub>PLL\_IN</sub> and f<sub>Mod</sub> must be expressed in Hz.

As an example:

If  $f_{PLL\_IN} = 1$  MHz, and  $f_{MOD} = 1$  kHz, the modulation depth (MODEPER) is given by equation 1:

$$MODEPER = \text{round}[10^6 / (4 \times 10^3)] = 250$$

Equation 2

Equation 2 allows to calculate the increment step (INCSTEP):

$$INCSTEP = \text{round}[(2^{15} - 1) \times md \times PLLN / (100 \times 5 \times MODEPER)]$$

$f_{VCO\_OUT}$  must be expressed in MHz.

With a modulation depth (md) =  $\pm 2\%$  (4 % peak to peak), and PLLN = 240 (in MHz):

$$INCSTEP = \text{round}[(2^{15} - 1) \times 2 \times 240 / (100 \times 5 \times 250)] = 126md(\text{quantitized})\%$$

An amplitude quantization error may be generated because the linear modulation profile is obtained by taking the quantized values (rounded to the nearest integer) of MODEPER and INCSTEP. As a result, the achieved modulation depth is quantized. The percentage quantized modulation depth is given by the following formula:

$$md_{\text{quantized}}\% = (MODEPER \times INCSTEP \times 100 \times 5) / ((2^{15} - 1) \times PLLN)$$

As a result:

$$md_{\text{quantized}}\% = (250 \times 126 \times 100 \times 5) / ((2^{15} - 1) \times 240) = 2.002\%(\text{peak})$$

Figure 34 and Figure 35 show the main PLL output clock waveforms in center spread and down spread modes, where:

- F0 is  $f_{PLL\_OUT}$  nominal.
- $T_{\text{mode}}$  is the modulation period.
- md is the modulation depth.

### 6.3.17 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB**: A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 60](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 60. EMS characteristics**

Symbol	Parameter	Conditions	Level/Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{HCLK} = 216\text{ MHz}$ , conforms to IEC 61000-4-2	2B
$V_{FTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{HCLK} = 168\text{ MHz}$ , conforms to IEC 61000-4-2	5A

As a consequence, it is recommended to add a serial resistor (1 k $\Omega$ ) located as close as possible to the MCU to the pins exposed to noise (connected to tracks longer than 50 mm on PCB).

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

**Electromagnetic Interference (EMI)**

The electromagnetic field emitted by the device are monitored while a simple application, executing EEMBC code, is running. This emission test is compliant with SAE IEC61967-2 standard which specifies the test board and the pin loading.

**Table 61. EMI characteristics**

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f <sub>HSE</sub> /f <sub>CPU</sub> ]	Unit
				8/200 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 3.6 V, T <sub>A</sub> = 25 °C, TFBGA216 package, conforming to IEC61967-2 ART/L1-cache ON, over-drive ON, all peripheral clocks enabled, clock dithering disabled.	0.1 to 30 MHz	5	dBμV
			30 to 130 MHz	10	
			130 MHz to 1 GHz	18	
			1 GHz to 2 GHz	10	
			EMI Level	3.5	
		V <sub>DD</sub> = 3.6 V, T <sub>A</sub> = 25 °C, TFBGA216 package, conforming to IEC61967-2 ART/L1-cache ON, over-drive ON, all peripheral clocks enabled, clock dithering enabled.	0.1 to 30 MHz	2	dBμV
			30 to 130 MHz	9	
			130 MHz to 1 GHz	14	
			1 GHz to 2 GHz	9	
			EMI Level	3	

**6.3.18 Absolute maximum ratings (electrical sensitivity)**

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

**Electrostatic discharge (ESD)**

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the ANSI/ESDA/JEDEC JS-001-2012 and ANSI/ESD S5.3.1-2009 standards.

**Table 62. ESD absolute maximum ratings**

Symbol	Ratings	Conditions	Class	Maximum value <sup>(1)</sup>	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	$T_A = +25\text{ °C}$ conforming to ANSI/ESDA/JEDEC JS-001-2012	2	2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	$T_A = +25\text{ °C}$ conforming to ANSI/ESD S5.3.1-2009, all packages except TFBGA100	3	250	
		$T_A = +25\text{ °C}$ conforming to ANSI/ESD S5.3.1-2009, TFBGA100 package	4	500	

1. Guaranteed by characterization results.

### Static latchup

Two complementary static tests are required on six parts to assess the latchup performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latchup standard.

**Table 63. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	$T_A = +105\text{ °C}$ conforming to JESD78A	II level A

### 6.3.19 I/O current injection characteristics

As a general rule, a current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard, 3 V-capable I/O pins) should be avoided during the normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when an abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during the device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (>5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of  $-5\text{ }\mu\text{A}/+0\text{ }\mu\text{A}$  range), or other functional failure (for example reset, oscillator frequency deviation).

A negative induced leakage current is caused by negative injection and positive induced leakage current by positive injection.

The test results are given in [Table 64](#).

**Table 64. I/O current injection susceptibility**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I <sub>INJ</sub>	Injected current on BOOT0, DSI_D0P, DSI_D0N, DSI_D1P, DSI_D1N, DSI_CKP, DSI_CKN pin	- 0	0	mA
	Injected current on NRST pin	- 0	NA <sup>(1)</sup>	
	Injected current on PC0, PC2, PH1_OSCOUT pins	- 0	NA <sup>(1)</sup>	
	Injected current on any other FT pin	- 5	NA <sup>(1)</sup>	
	Injected current on any other pins	- 5	+5	

1. Injection is not possible.

*Note: It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.*

### 6.3.20 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 65: I/O static characteristics](#) are derived from tests performed under the conditions summarized in [Table 17](#). All I/Os are CMOS and TTL compliant.

1. Guaranteed by design.
2. Tested in production.
3. With a minimum of 200 mV.
4. Leakage could be higher than the maximum value, if negative current is injected on adjacent pins, Refer to [Table 64: I/O current injection susceptibility](#)
5. To sustain a voltage higher than VDD +0.3 V, the internal pull-up/pull-down resistors must be disabled. Leakage could be higher than the maximum value, if negative current is injected on adjacent pins. Refer to [Table 64: I/O current injection susceptibility](#)
6. Pull-up resistors are designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimum (~10% order).
7. Pull-down resistors are designed with a true resistance in series with a switchable NMOS. This NMOS contribution to the series resistance is minimum (~10% order).
8. Hysteresis voltage between Schmitt trigger switching levels. Guaranteed by characterization results.

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements for FT I/Os is shown in [Figure 38](#).

Figure 38. FT I/O input characteristics

### Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and sink or source up to  $\pm 20$  mA (with a relaxed  $V_{OL}/V_{OH}$ ) except PC13, PC14, PC15 and PI8 which can sink or source up to  $\pm 3$  mA. When using the PC13 to PC15 and PI8 GPIOs in output mode, the speed should not exceed 2 MHz with a maximum load of 30 pF.

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#). In particular:

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $\Sigma I_{VDD}$  (see [Table 15](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $\Sigma I_{VSS}$  (see [Table 15](#)).

### Output voltage levels

Unless otherwise specified, the parameters given in [Table 66](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 17](#). All I/Os are CMOS and TTL compliant.

1. The  $I_{IO}$  current sunk by the device must always respect the absolute maximum rating specified in [Table 15](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. The  $I_{IO}$  current sourced by the device must always respect the absolute maximum rating specified in [Table 15](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VDD}$ .
4. Based on characterization data.
5. Guaranteed by design.

#### Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 39](#) and [Table 67](#), respectively.

Unless otherwise specified, the parameters given in [Table 67](#) are derived from tests performed under the ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 17](#).

### 6.3.21 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 65: I/O static characteristics](#)).

Unless otherwise specified, the parameters given in [Table 68](#) are derived from tests performed under the ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 17](#).

**Table 68. NRST pin characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_{PU}$	Weak pull-up equivalent resistor <sup>(1)</sup>	$V_{IN} = V_{SS}$	30	40	50	k $\Omega$
$V_{F(NRST)}$ <sup>(2)</sup>	NRST Input filtered pulse	-	-	-	100	ns
$V_{NF(NRST)}$ <sup>(2)</sup>	NRST Input not filtered pulse	$V_{DD} > 2.7 V$	300	-	-	ns
$T_{NRST\_OUT}$	Generated reset pulse duration	Internal Reset source	20	-	-	$\mu s$

1. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).
2. Guaranteed by design.

**Figure 40. Recommended NRST pin protection**

1. The reset network protects the device against parasitic resets. 0.1  $\mu F$  capacitor must be placed as close as possible to the chip.
2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 65](#). Otherwise the reset is not taken into account by the device.

### 6.3.22 TIM timer characteristics

The parameters given in [Table 69](#) are guaranteed by design.

Refer to [Section 6.3.20: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

**Table 69. TIMx characteristics<sup>(1)(2)</sup>**

Symbol	Parameter	Conditions <sup>(3)</sup>	Min	Max	Unit

$t_{MAX\_COUNT}$	Maximum possible count with 32-bit counter	-	-	$65536 \times 65536$	$t_{TIMxCLK}$

1. TIMx is used as a general term to refer to the TIM1 to TIM12 timers.
2. Guaranteed by design.
3. The maximum timer frequency on APB1 or APB2 is up to 216 MHz, by setting the TIMPRE bit in the RCC\_DCKCFGR register, if APBx prescaler is 1 or 2 or 4, then  $TIMxCLK = HCLK$ , otherwise  $TIMxCLK = 4 \times PCLKx$ .

- $V_{DDA}$  minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to [Section 3.18.2: Internal reset OFF](#)).
- Guaranteed by characterization results.
- $V_{REF+}$  is internally connected to  $V_{DDA}$  and  $V_{REF-}$  is internally connected to  $V_{SSA}$ .
- $R_{ADC}$  maximum value is given for  $V_{DD}=1.7$  V, and minimum value for  $V_{DD}=3.3$  V.
- For external triggers, a delay of  $1/f_{PCLK2}$  must be added to the latency specified in [Table 71](#).

**Equation 1:  $R_{AIN}$  max formula**

$$R_{AIN} = \frac{(k - 0.5)}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above ([Equation 1](#)) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. N = 12 (from 12-bit resolution) and k is the number of sampling periods defined in the ADC\_SMPR1 register.

Note: ADC accuracy vs. negative injection current: injecting a negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.

Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 6.3.20](#) does not affect the ADC accuracy.

3. Ideal transfer curve.
4. End point correlation line.
5.  $E_T$  = Total Unadjusted Error: maximum deviation between the actual and the ideal transfer curves.  
 $E_O$  = Offset Error: deviation between the first actual transition and the first ideal one.  
 $E_G$  = Gain Error: deviation between the last ideal transition and the last actual one.  
 $E_D$  = Differential Linearity Error: maximum deviation between actual steps and the ideal one.  
 $E_L$  = Integral Linearity Error: maximum deviation between any actual transition and the end point correlation line.

Figure 42. Typical connection diagram using the ADC

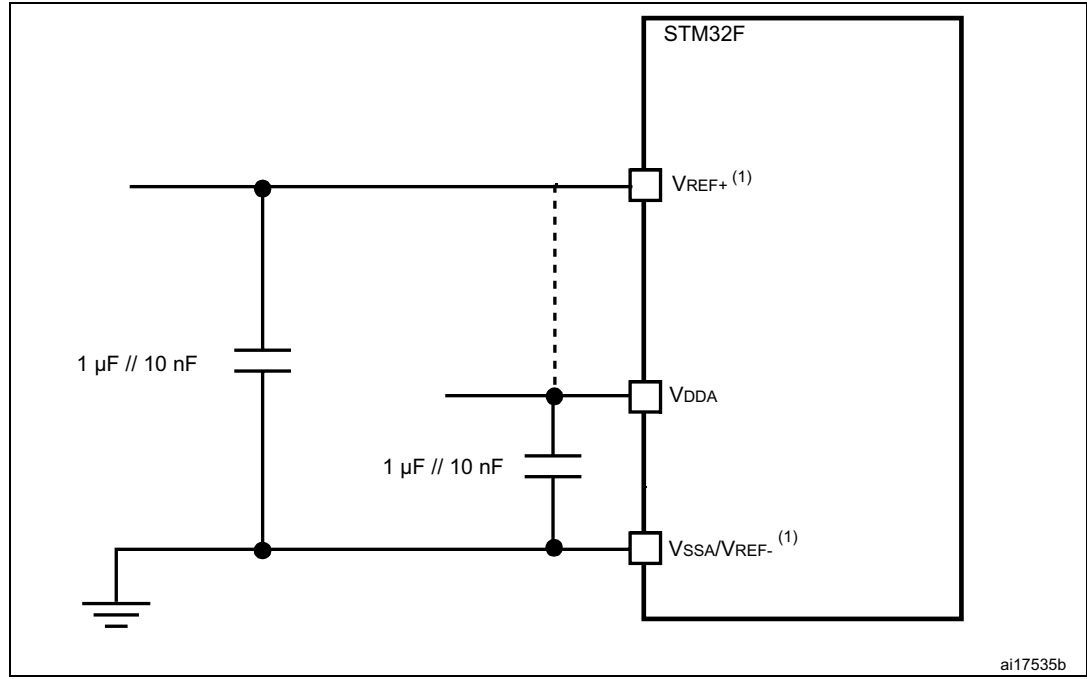

1. Refer to [Table 71](#) for the values of  $R_{AIN}$ ,  $R_{ADC}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 5 pF). A high  $C_{parasitic}$  value downgrades conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

**General PCB design guidelines**

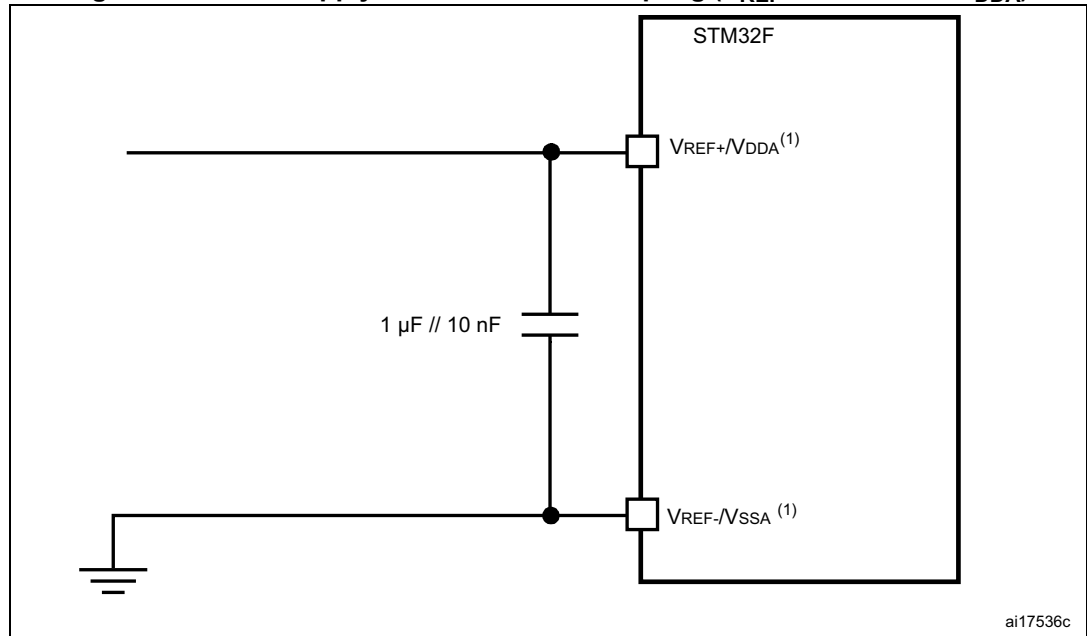

Power supply decoupling should be performed as shown in *Figure 43* or *Figure 44*, depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. The 10 nF capacitors should be ceramic (good quality). They should be placed them as close as possible to the chip.

**Figure 43. Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )**

1.  $V_{REF+}$  input is available on all packages except TFBGA100 whereas the  $V_{REF-}$  is available only on UFBGA176 and TFBGA216. When  $V_{REF-}$  is not available, it is internally connected to  $V_{DDA}$  and  $V_{SSA}$ .

- $V_{DDA}$  minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to [Section 3.18.2: Internal reset OFF](#)).
- Guaranteed by design.
- The quiescent mode corresponds to a state where the DAC maintains a stable output level to ensure that no dynamic consumption occurs.
- Guaranteed by characterization results.

Figure 45. 12-bit buffered /non-buffered DAC

- The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

### 6.3.29 Communications interfaces

#### I<sup>2</sup>C interface characteristics

The I<sup>2</sup>C interface meets the timings requirements of the I<sup>2</sup>C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s.
- Fast-mode Plus (Fm+): with a bit rate up to 1Mbit/s.

The I<sup>2</sup>C timings requirements are guaranteed by design when the I2C peripheral is properly configured (refer to RM0410 reference manual) and when the I2CCLK frequency is greater than the minimum shown in the table below:

**Table 83. Minimum I2CCLK frequency in all I2C modes**

Symbol	Parameter	Condition		Min	Unit
f(I2CCLK)	I2CCLK frequency	Standard-mode	-	2	MHz
		Fast-mode	Analog filter ON DNF=0	8	
			Analog filter OFF DNF=1	9	
		Fast-mode Plus	Analog filter ON DNF=0	16	
			Analog filter OFF DNF=1	16	

The SDA and SCL I/O requirements are met with the following restrictions:

- The SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V<sub>DD</sub> is disabled, but is still present.
- The 20mA output drive requirement in Fast-mode Plus is not supported. This limits the maximum load C<sub>load</sub> supported in Fm+, which is given by these formulas:

$$Tr(SDA/SCL) = 0.8473 \times R_p \times C_{load}$$

$$R_p(\min) = (V_{DD} - V_{OL}(\max)) / I_{OL}(\max)$$

Where R<sub>p</sub> is the I2C lines pull-up. Refer to [Section 6.3.20: I/O port characteristics](#) for the I2C I/Os characteristics.

All I<sup>2</sup>C SDA and SCL I/Os embed an analog filter. Refer to [Table 84](#) for the analog filter characteristics:

**Table 84. I2C analog filter characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
t <sub>AF</sub>	Maximum pulse width of spikes that are suppressed by the analog filter	50 <sup>(2)</sup>	70 <sup>(3)</sup>	ns

1. Guaranteed by characterization results.
2. Spikes with widths below t<sub>AF(min)</sub> are filtered.
3. Spikes with widths above t<sub>AF(max)</sub> are not filtered.

**SPI interface characteristics**

Unless otherwise specified, the parameters given in [Table 85](#) for the SPI interface are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 17](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels:  $0.5V_{DD}$

Refer to [Section 6.3.20: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

1. Guaranteed by characterization results.
2. Excepting SPI1 with SCK IO pin mapped on PA5. In this configuration, Maximum achievable frequency is 40MHz.
3. Maximum Frequency of Slave Transmitter is determined by sum of Tv(SO) and Tsu(MI) intervals which has to fit into SCK level phase preceding the SCK sampling edge. This value can be achieved when it communicates with a Master having Tsu(MI)=0 while signal Duty(SCK)=50%.
4. Only for SPI6.

## I<sup>2</sup>S interface characteristics

Unless otherwise specified, the parameters given in [Table 86](#) for the I<sup>2</sup>S interface are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 17](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels:  $0.5V_{DD}$

1. Guaranteed by characterization results.

2. The maximum value of 256x $F_S$  is 49.152 MHz (APB1 maximum frequency).

**Note:** Refer to RM0410 reference manual I2S section for more details about the sampling frequency ( $F_S$ ).  $f_{MCK}$ ,  $f_{CK}$ , and  $D_{CK}$  values reflect only the digital peripheral behavior. The values of these parameters might be slightly impacted by the source clock precision.  $D_{CK}$  depends mainly on the value of ODD bit. The digital contribution leads to a minimum value of  $(I2SDIV)/(2*I2SDIV+ODD)$  and a maximum value of  $(I2SDIV+ODD)/(2*I2SDIV+ODD)$ .  $F_S$  maximum value is supported for each mode/condition.

1. All the voltages are measured from the local ground potential.
2. The USB OTG full speed transceiver functionality is ensured down to 2.7 V but not the full USB full speed electrical characteristics which are degraded in the 2.7-to-3.0 V V<sub>DDUSB</sub> voltage range.
3. Guaranteed by design.
4. R<sub>L</sub> is the load connected on the USB OTG full speed drivers.

**Note:** When VBUS sensing feature is enabled, PA9 and PB13 should be left at their default state (floating input), not as alternate function. A typical 200 μA current consumption of the sensing block (current to voltage conversion to determine the different sessions) can be observed on PA9 and PB13 when the feature is enabled.

### Ethernet characteristics

Unless otherwise specified, the parameters given in [Table 96](#), [Table 97](#) and [Table 98](#) for SMI, RMII and MII are derived from tests performed under the ambient temperature, f<sub>HCLK</sub> frequency summarized in [Table 17](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load C = 20 pF
- Measurement points are done at CMOS levels: 0.5V<sub>DD</sub>.

Refer to [Section 6.3.20: I/O port characteristics](#) for more details on the input/output characteristics.

[Table 96](#) gives the list of Ethernet MAC signals for the SMI (station management interface) and [Figure 57](#) shows the corresponding timing diagram.

### Asynchronous waveforms and timings

[Figure 61](#) through [Figure 64](#) represent asynchronous waveforms and [Table 100](#) through [Table 107](#) provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- AddressSetupTime = 0x1
- AddressHoldTime = 0x1
- DataSetupTime = 0x1 (except for asynchronous NWAIT mode , DataSetupTime = 0x5)
- BusTurnAroundDuration = 0x0
- Capacitive load CL = 30 pF

In all timing tables, the  $T_{HCLK}$  is the HCLK clock period

### Synchronous waveforms and timings

Figure 65 through Figure 68 represent synchronous waveforms and Table 108 through Table 111 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- BurstAccessMode = FMC\_BurstAccessMode\_Enable;
- MemoryType = FMC\_MemoryType\_CRAM;
- WriteBurst = FMC\_WriteBurst\_Enable;
- CLKDivision = 1;
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM
- CL = 30 pF on data and address lines. CL = 10 pF on FMC\_CLK unless otherwise specified.

In all the timing tables, the  $T_{HCLK}$  is the HCLK clock period.

- For  $2.7 V \leq V_{DD} \leq 3.6 V$ , maximum FMC\_CLK = 100 MHz at CL=20 pF or 90 MHz at CL=30 pF (on FMC\_CLK).
- For  $1.71 V \leq V_{DD} < 2.7 V$ , maximum FMC\_CLK = 70 MHz at CL=10 pF (on FMC\_CLK).

- ATT.FMC\_HiZSetupTime = 0x01;
- Bank = FMC\_Bank\_NAND;
- MemoryDataWidth = FMC\_MemoryDataWidth\_16b;
- ECC = FMC\_ECC\_Enable;
- ECCPageSize = FMC\_ECCPageSize\_512Bytes;
- TCLRSetupTime = 0;
- TARSetupTime = 0.

In all timing tables, the  $T_{HCLK}$  is the HCLK clock period.

**SDRAM waveforms and timings**

- CL = 30 pF on data and address lines. CL = 10 pF on FMC\_SDCLK unless otherwise specified.

In all timing tables, the  $T_{HCLK}$  is the HCLK clock period.

- For  $3.0 V \leq V_{DD} \leq 3.6 V$ , maximum FMC\_SDCLK = 100 MHz at CL=20 pF (on FMC\_SDCLK).
- For  $2.7 V \leq V_{DD} \leq 3.6 V$ , maximum FMC\_SDCLK = 90 MHz at CL=30 pF (on FMC\_SDCLK).
- For  $1.71 V \leq V_{DD} < 1.9 V$ , maximum FMC\_SDCLK = 70 MHz at CL=10 pF (on FMC\_SDCLK).

## 7.9 Thermal characteristics

The maximum chip-junction temperature,  $T_J \text{ max}$ , in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A \text{ max}$  is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D \text{ max}$  is the sum of  $P_{INT} \text{ max}$  and  $P_{I/O} \text{ max}$  ( $P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$ ),
- $P_{INT} \text{ max}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O} \text{ max}$  represents the maximum power dissipation on output pins where:

$$P_{I/O} \text{ max} = \Sigma (V_{OL} \times I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \times I_{OH}),$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 137. Package thermal characteristics**

## Appendix A      Recommendations when using internal reset OFF

When the internal reset is OFF, the following integrated features are no longer supported:

- The integrated power-on reset (POR) / power-down reset (PDR) circuitry is disabled
- The brownout reset (BOR) circuitry must be disabled
- The embedded programmable voltage detector (PVD) is disabled
- V<sub>BAT</sub> functionality is no more available and VBAT pin should be connected to V<sub>DD</sub>
- The over-drive mode is not supported

### A.1      Operating conditions

**Table 139. Limitations depending on the operating power supply range**

Operating power supply range	ADC operation	Maximum Flash memory access frequency with no wait states (f <sub>Flashmax</sub> )	Maximum Flash memory access frequency with wait states <sup>(1)(2)</sup>	I/O operation	Possible Flash memory operations
V <sub>DD</sub> = 1.7 to 2.1 V <sup>(3)</sup>	Conversion time up to 1.2 Msps	20 MHz	168 MHz with 8 wait states and over-drive OFF	– No I/O compensation	8-bit erase and program operations only

1. Applicable only when the code is executed from Flash memory. When the code is executed from RAM, no wait state is required.
2. Thanks to the ART accelerator on ITCM interface and L1-cache on AXI interface, the number of wait states given here does not impact the execution speed from the Flash memory since the ART accelerator or L1-cache allows to achieve a performance equivalent to 0-wait state program execution.
3. V<sub>DD</sub>/V<sub>DDA</sub> minimum value of 1.7 V, with the use of an external power supply supervisor (refer to [Section 3.18.1: Internal reset ON](#)).
