

Smart High-Side Power Switch

Functions

- Very low standby current
- CMOS compatible input
- Fast demagnetization of inductive loads
- Stable behaviour at undervoltage
- Wide operating voltage range
- Logic ground independent from load ground
- Short circuit protection
- Overload protection
- Current limitation
- Thermal shutdown
- Overvoltage protection (including load dump) with external resistor
- Reverse battery protection with external resistor
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge protection (ESD)
- Green Product (RoHS compliant)
- AEC Qualified

Product Summary

Operating voltage	$V_{bb(on)}$	4.7... 41	V
On-state resistance	R_{ON}	38	m Ω
Nominal load current	$I_{L(NOM)}$	9.8	A
Current limitation	$I_{L(SCr)}$	40	A

Applications

- μ C compatible high-side power switch with diagnostic feedback for 5V, 12V and 24V grounded loads
- All types of resistive, inductive and capacitive loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS[®] technology.
- Providing embedded protective functions

Diagnostic Function

- Diagnostic feedback with open drain output
- Open load detection in ON-state
- Feedback of thermal shutdown in ON-state

¹⁰⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹¹⁾ Device on 50mm*50mm*1.5mm epoxy PCB FR4 with 6cm² (one layer, 70 μm thick) copper area for V_{bb} connection. PCB is vertical without blown air.

¹²⁾ Requires 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 7).

¹³⁾ not subject to production test, specified by design

¹⁴⁾ If a ground resistor R_{GND} is used, add the voltage drop across this resistor.

Terms

Input circuit (ESD protection)

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended

Status output

ESD-Zener diode: 6.1 V typ., max 5.0 mA; $R_{ST(ON)} < 375 \Omega$ at 1.6 mA. The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Inductive and overvoltage output clamp

V_{ON} clamped to 47 V typ.

Overvolt. and reverse batt. protection

$V_{Z1} = 6.1 \text{ V typ.}$, $V_{Z2} = 47 \text{ V typ.}$, $R_{GND} = 150 \Omega$, $R_{ST} = 15 \text{ k}\Omega$, $R_I = 3.5 \text{ k}\Omega \text{ typ.}$

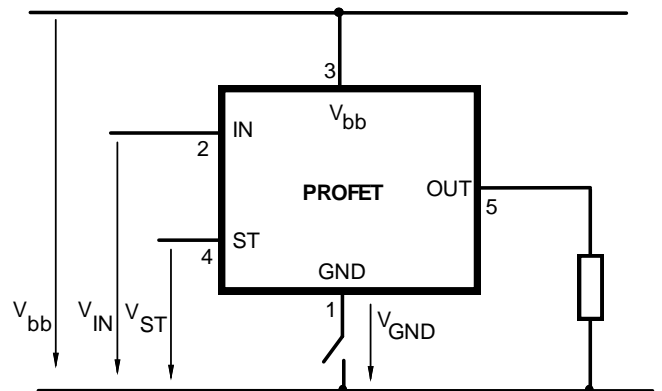

In case of reverse battery the load current has to be limited by the load. Temperature protection is not active

Open-load detection in on-state

Open load, if $V_{ON} < R_{ON} \cdot I_{L(OL)}$; IN high

GND disconnect

Any kind of load. In case of Input=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$. Due to $V_{GND} > 0$, no $V_{ST} = \text{low signal}$ available.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
 Due to $V_{GND} > 0$, no $V_{ST} = \text{low signal}$ available.

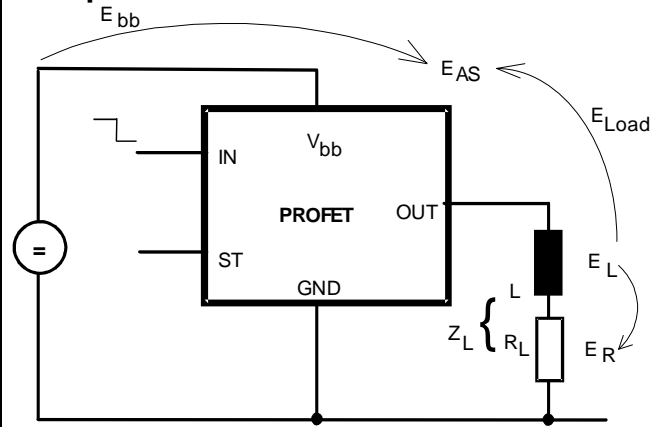

Vbb disconnect with energized inductive load

For inductive load currents up to the limits defined by Z_L (max. ratings and diagram on page 8) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load all the load current flows through the GND connection.

Inductive Load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = 1/2 \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot (V_{bb} + |V_{OUT(CL)}|) \cdot \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

Maximum allowable load inductance for a single switch off

$L = f(I_L)$; $T_{j,start} = 150^\circ C$, $T_C = 150^\circ C$ const.,
 $V_{bb} = 12 V$, $R_L = 0 \Omega$

Z_L [mH]

I_L [A]

Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j); I_L = 2\text{ A}, I_N = \text{high}$

Typ. standby current

$I_{bb(off)} = f(T_j); V_{bb} = 9...34\text{ V}, I_{N1,2} = \text{low}$
