Micropower Undervoltage Sensing Circuits

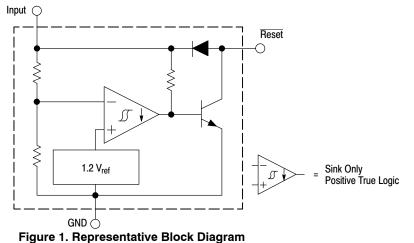

MC34164, MC33164, NCV33164

The MC34164 series are undervoltage sensing circuits specifically designed for use as reset controllers in portable microprocessor based systems where extended battery life is required. These devices offer the designer an economical solution for low voltage detection with a single external resistor. The MC34164 series features a bandgap reference, a comparator with precise thresholds and built–in hysteresis to prevent erratic reset operation, an open collector reset output capable of sinking in excess of 6.0 mA, and guaranteed operation down to 1.0 V input with extremely low standby current. The MC devices are packaged in 3–pin TO–92 (TO–226AA), micro size TSOP–5, 8–pin SOIC–8 and Micro8 surface mount packages. The NCV device is packaged in SOIC–8.

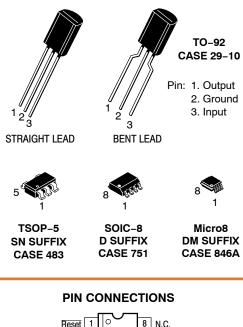

Applications include direct monitoring of the 3.0 V or 5.0 V MPU/logic power supply used in appliance, automotive, consumer, and industrial equipment.

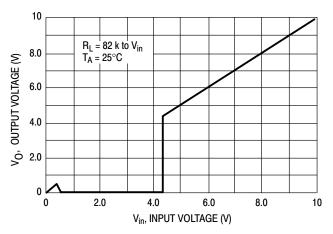

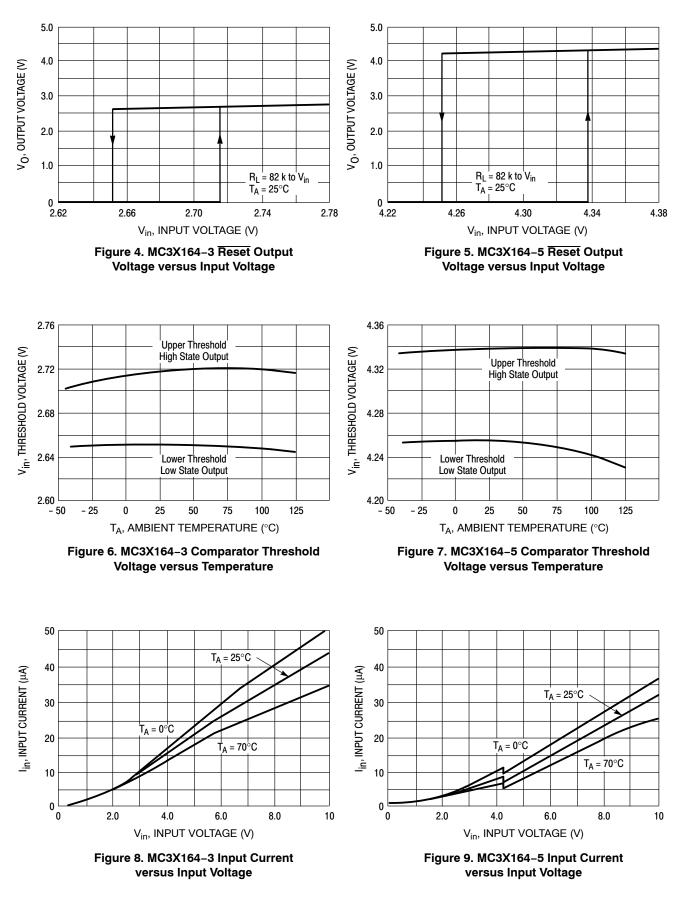

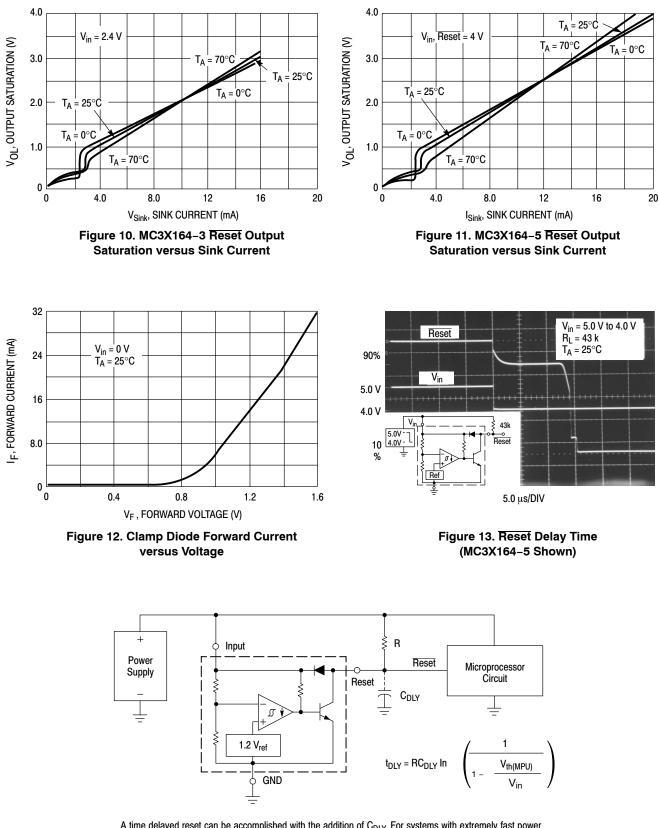

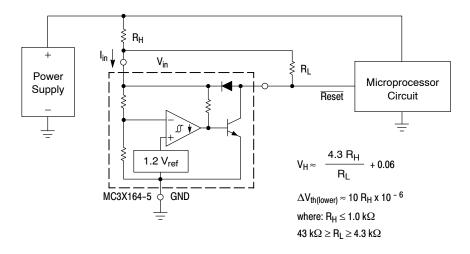

Figure 3. MC3X164–5 Reset Output Voltage versus Input Voltage

A time delayed reset can be accomplished with the addition of C_{DLY}. For systems with extremely fast power supply rise times (< 500 ns) it is recommended that the RC_{DLY} time constant be greater than 5.0 μ s. V_{th(MPU)} is the microprocessor reset input threshold.

Comparator hysteresis can be increased with the addition of resistor R_H. The hysteresis equation has been simplified and does not account for the change of input current I_{in} as V_{in} crosses the comparator threshold (Figure 8). An increase of the lower threshold $\Delta V_{th(lower)}$ will be observed due to I_{in} which is typically 10 μ A at 4.3 V. The equations are accurate to \pm 10% with R_H less than 1.0 k Ω and R_L between 4.3 k Ω and 43 k Ω .
