

## 300 mA very low quiescent current linear regulator IC with automatic green mode

### Features

- Input voltage from 1.4 to 5.5 V
- Ultra low dropout voltage (300 mV typ. at 300 mA load)
- Automatic green mode
- Very low quiescent current (1  $\mu$ A in green mode, 45  $\mu$ A in normal mode and 0.1  $\mu$ A typ. in off mode)
- Output voltage tolerance:  $\pm 1.0\%$  at 25  $^{\circ}$ C
- 300 mA guaranteed output current
- Wide range of output voltages available on request: adjustable from 0.8 V, fixed up to 4.0 V in 100 mV step
- Logic-controlled electronic shutdown
- Internal soft-start
- Compatible with ceramic capacitor  $C_{OUT} = 330$  nF
- Internal current foldback and thermal protections
- Available in DFN6 1.2x1.3 mm and Flip-chip 4 bumps 0.69 x 0.69 mm. 0.4 pitch
- Operating temperature range: -40  $^{\circ}$ C to 125  $^{\circ}$ C
- Available in 5 k or 10 k bulk depending on output voltage

### Applications

- Mobile phones
- Digital still cameras (DSC)
- Cordless phones and similar battery-powered systems
- Portable media players

### Description

The **LD39130S** is a high accuracy voltage regulator that provides 300 mA maximum current from an input voltage ranging from 1.4 V to 5.5 V, with a typical dropout voltage of 300 mV.

It is available in DFN6 1.2 x 1.3 mm package and in ultra-small CSP 4 bumps package, allowing the maximum space saving.

The device is stabilized with a ceramic capacitor on the output. The ultra-low drop voltage, low quiescent current and low noise features make it suitable for low power battery-operated applications. It integrates an internal logic circuitry, which allows the regulator to be in ultra-low consumption mode (green mode), when the output current required is very low. The normal working mode, with fast transient response, is restored when the load current increases.

The enable logic control function puts the **LD39130S** in shutdown mode allowing a total current consumption lower than 0.1  $\mu$ A. The current foldback and thermal protection are provided.

## 6 Application information

### 6.1 Output voltage setting for ADJ version

In the adjustable version, the output voltage can be set from 0.8 V to the input voltage minus the voltage drop across the pass transistor (dropout voltage), by connecting a resistor divider between the ADJ pin and the output, allowing remote voltage sensing. The resistor divider can be determined using the following equation:

**Equation 2**

$$V_{OUT} = V_{ADJ} \times \left(1 + \frac{R_1}{R_2}\right) \text{ with } V_{ADJ} = 0.8V(\text{typ.}) \quad (1)$$

Even if the regulator is stable with no load, the maximum value for  $R_2$  should not exceed 2 M $\Omega$  in order to ensure the best dynamic performance.

### 6.2 Soft-start function

The LD39130S has an internal soft-start circuit. By increasing the startup time up to 100  $\mu$ s, without the need of any external soft-start capacitor, this feature keeps the regulator inrush current at startup under control.

### 6.3 Auto green mode function

The LD39130S integrates an internal logic circuitry, which allows the regulator to be in ultra-low consumption mode (green mode), when the output current required is very low.

When the auto green mode is enabled, the regulator automatically selects its operating mode, switching from a very low consumption operation at light loads, to a very fast transient response mode when the load current increases.

In the LD39130S, in DFN6 package, this function can be disabled by the user, by means of an external logic pin (GM). When the GM pin is set at high logic level, the device always operates in normal mode (fast transient response), while if the GM pin is set low, the auto green mode is enabled.

The LD39130SJ (CSP version) always operates in auto green mode.

### 6.4 Input and output capacitors

The LD39130S requires external capacitors to ensure the regulator control loop stability. These capacitors must be selected to meet the requirements of minimum capacitance and equivalent series resistance (see [Figure 32. Stability plan vs. \(COUT, ESR\)](#)). Locating the input/output capacitors as close as possible to the relative pins, is suggested.

#### 6.4.1 Input capacitor

A capacitor with a minimum value of 1  $\mu$ F is required at the input voltage of the LD39130S. This capacitor must be located as close as possible to the input pin of the device and returned to a clean analog ground. Any good quality ceramic capacitor can be used.

#### 6.4.2 Output capacitor

The control loop of the LD39130S is designed to work with ceramic capacitors at the output.

The output capacitor must meet the requirements for the minimum amount of capacitance and E.S.R. (equivalent series resistance) as shown in [Figure 32. Stability plan vs. \(COUT, ESR\)](#).

The suggested value of 1  $\mu$ F is a good choice to guarantee the stability of the regulator and to provide the optimum transient response. The output capacitor must maintain its ESR and capacitance in the stable region, over the full operating temperature range, to assure stability.

### 6.5 Output discharge function

The LD39130S integrates a MOSFET connected between  $V_{OUT}$  and GND. This transistor is activated when the EN pin goes to low logic level and has the function to quickly discharge the output capacitor when the device is disabled by the user.

- Note:*
- 1 - Dimensioning and tolerancing conform to ASME Y14.5-2009.
  - 2 - All dimension are in millimetres, angle are in degrees.
  - 3 - N is the total numbers of terminals.
  - 4 - The location of the marked terminal #1 identifier as within the hatched area.
  - 5 - ND refers to the maximum number of terminals D side.
  - 6 - dimension b applies to metallized terminal and is measured between 0.15 mm and 0.30 mm from the terminal tip. If the terminal has a radius on the other end, the dimension b should not be measured in that radius area.
  - 7 - Coplanarity applies to the terminals and all other bottom surface metallization.
  - 8 - Lead frame thickness is 0.127 mm

Date	Revision	Changes
08-Oct-2013	1	Initial release.
20-Jan-2015	2	Updated Figure 19: Quiescent current vs. input voltage (auto green mode) and Figure 23: Quiescent current vs. load current (light load) Updated Table 3: Thermal data, Table 4: ESD performance, Table 5: LD39130S/LD39130SJ electrical characteristics (fixed versions), Table 6: LD39130S electrical characteristics (adjustable version), Figure 19: Quiescent current vs. input voltage (auto green mode), Figure 23: Quiescent current vs. load current (light load), Figure 39: Turn-on time and Figure 41: Line transient (auto green mode). Minor text changes.
04-Apr-2018	3	Throughout document: - minor text and formatting changes In Table 1. Pin description: - updated GM and EN function descriptions Updated Figure 5. Typical application circuits Added Section 6.1 Output voltage setting for ADJ version Updated Section 7 Typical characteristics Updated Table 9. Order codes
13-Jun-2018	4	Updated Figure 50. DFN6 1.2x1.3 mm package mechanical outline.
06-Jul-2018	5	Updated Table 8. DFN6 1.2x1.3 mm mechanical data.
11-May-2020	6	Added new Figure 52 and footnote in Table 10.
06-Nov-2020	7	Updated <a href="#">Section 8.2 DFN6 1.2x1.3 mm package information</a> .
