

1.5A Dual MOSFET Driver with Low Threshold Input and Enable

Features

- High Peak Output Current: 1.5A (typical)
- Wide Input Supply Voltage Operating Range:
 - 4.5V to 18V
- Low Shoot-Through/Cross-Conduction Current in Output Stage
- High Capacitive Load Drive Capability:
 - 1000 pF in 11.5 ns (typical)
- Short Delay Times: 25 ns (t_{D1}), 24 ns (t_{D2}) (typical)
- Low Supply Current: 750 μ A (typical)
- Low-Voltage Threshold Input and Enable with Hysteresis
- Latch-up Protected: Withstands 500 mA Reverse Current
- Space-Saving Packages:
 - 8-Lead MSOP
 - 8-Lead SOIC
 - 8-Lead 2x3 TDFN

Applications

- Switch-Mode Power Supplies (SMPS)
- Pulse Transformer Drive
- Line Drivers
- Level Translator
- Motor and Solenoid Drive

General Description

The MCP14A0153/4/5 devices are high-speed dual MOSFET drivers that are capable of providing up to 1.5A of peak current while operating from a single 4.5V to 18V supply. There are three output configurations available: dual inverting (MCP14A0153), dual non-inverting (MCP14A0154) and complementary (MCP14A0155). These devices feature low shoot-through current, matched rise and fall times and short propagation delays, which make them ideal for high switching frequency applications.

The MCP14A0153/4/5 family of devices offers enhanced control with enable functionality. The active-high enable pins can be driven low to drive the corresponding outputs of the MCP14A0153/4/5 low, regardless of the status of the input pin. An integrated pull-up resistor allows the user to leave the enable pins floating for standard operation.

These devices are highly latch-up resistant under any condition within their power and voltage ratings. They can accept up to 500 mA of reverse current being forced back into their outputs without damage or logic upset. All terminals are fully protected against Electrostatic Discharge (ESD), up to 2 kV (HBM) and 200 V (MM).

Package Types

MCP14A0153/4/5

Functional Block Diagram

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

V_{DD} , Supply Voltage.....	+20V
V_{IN} , Input Voltage..... ($V_{DD} + 0.3V$) to ($GND - 0.3V$)	
V_{EN} , Enable Voltage..... ($V_{DD} + 0.3V$) to ($GND - 0.3V$)	
Package Power Dissipation ($T_A = +50^{\circ}C$)	
8L MSOP	0.63W
8L SOIC	1.00W
8L 2 x 3 TDFN.....	1.86W
ESD Protection on all Pins	2 kV (HBM)
.....	200V (MM)

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, $T_A = +25^{\circ}C$, with $4.5V \leq V_{DD} \leq 18V$.						
Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Input						
Input Voltage Range	V_{IN}	$GND - 0.3$	—	$V_{DD} + 0.3$	V	
Logic '1' High Input Voltage	V_{IH}	2.0	1.6	—	V	
Logic '0' Low Input Voltage	V_{IL}	—	1.2	0.8	V	
Input Voltage Hysteresis	$V_{HYST(IN)}$	—	0.4	—	V	
Input Current	I_{IN}	-1	—	+1	μA	$0V \leq V_{IN} \leq V_{DD}$
Enable						
Enable Voltage Range	V_{EN}	$GND - 0.3V$	—	$V_{DD} + 0.3$	V	
Logic '1' High Enable Voltage	V_{EH}	2	1.6	—	V	
Logic '0' Low Enable Voltage	V_{EL}	—	1.2	0.8	V	
Enable Voltage Hysteresis	$V_{HYST(EN)}$	—	0.4	—	V	
Enable Pin Pull-up Resistance	R_{ENBL}	—	1.8	—	$M\Omega$	$V_{DD} = 18V, EN = GND$
Enable Input Current	I_{EN}	—	10	—	μA	$V_{DD} = 18V, EN = GND$
Propagation Delay	t_{D3}	—	25	32	ns	$V_{DD} = 18V, V_{EN} = 5V$, see Figure 4-3 (Note 1)
Propagation Delay	t_{D4}	—	24	31	ns	$V_{DD} = 18V, V_{EN} = 5V$, see Figure 4-3 (Note 1)
Output						
High Output Voltage	V_{OH}	$V_{DD} - 0.025$	—	—	V	$I_{OUT} = 0A$
Low Output Voltage	V_{OL}	—	—	0.025	V	$I_{OUT} = 0A$
Output Resistance, High	R_{OH}	—	4.5	6.5	Ω	$I_{OUT} = 10 mA, V_{DD} = 18V$
Output Resistance, Low	R_{OL}	—	3.0	4.5	Ω	$I_{OUT} = 10 mA, V_{DD} = 18V$
Peak Output Current	I_{PK}	—	1.5	—	A	$V_{DD} = 18V$ (Note 1)
Latch-up Protection Withstand Reverse Current	I_{REV}	0.5	—	—	A	Duty cycle $\leq 2\%$, $t \leq 300 \mu s$ (Note 1)

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE

MCP14A0153, MCP14A0154, MCP14A0155		Symbol	Description
2x3 TDFN	MSOP/SOIC		
1	1	EN A	Enable – Channel A
2	2	IN A	Input – Channel A
3	3	GND	Device Ground
4	4	IN B	Input – Channel B
5	5	$\overline{\text{OUT B}}/\text{OUT B}$	Output – Channel B
6	6	V_{DD}	Supply Input
7	7	$\overline{\text{OUT A}}/\text{OUT A}$	Output – Channel A
8	8	EN B	Enable – Channel B
EP	—	EP	Exposed Thermal Pad (GND)

3.1 Output Pins ($\overline{\text{OUT A}}/\text{OUT A}$, $\overline{\text{OUT B}}/\text{OUT B}$)

The outputs are CMOS push-pull circuits that are capable of sourcing and sinking 1.5A of peak current ($V_{DD} = 18V$). The low output impedance ensures the gate of the external MOSFET stays in the intended state, even during large transients. This output also has a reverse current latch-up rating of 500 mA.

3.2 Device Ground Pin (GND)

GND is the device return pin for the input and output stages. The GND pin should have a low-impedance connection to the bias supply source return. When the capacitive load is being discharged, high peak currents will flow through the ground pin.

3.3 Device Enable Pins (EN A, EN B)

The MOSFET driver device enable pins are high-impedance inputs featuring low threshold levels. The enable inputs also have hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals, and to provide noise immunity. Driving the enable pins below the threshold will disable the corresponding output of the device, pulling $\overline{\text{OUT}}/\text{OUT}$ low, regardless of the status of the input pin. Driving the enable pins above the threshold allows normal operation of the $\overline{\text{OUT}}/\text{OUT}$ pin based on the status of the input pin. The enable pins utilize internal pull-up resistors, allowing the pins to be left floating for standard driver operation.

3.4 Control Input Pins (IN A, IN B)

The MOSFET driver control inputs are high-impedance inputs featuring low threshold levels. The inputs also have hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals, and to provide noise immunity.

3.5 Supply Input Pin (V_{DD})

V_{DD} is the bias supply input for the MOSFET driver and has a voltage range of 4.5V to 18V. This input must be decoupled to ground with a local capacitor. This bypass capacitor provides a localized low-impedance path for the peak currents that are provided to the load.

3.6 Exposed Metal Pad Pin (EP)

The exposed metal pad of the TDFN package is internally connected to GND. Therefore, this pad should be connected to a Ground plane to aid in heat removal from the package.

MCP14A0153/4/5

4.0 APPLICATION INFORMATION

4.1 General Information

MOSFET drivers are high-speed, high-current devices which are intended to source/sink high peak currents to charge/discharge the gate capacitance of external MOSFETs or Insulated-Gate Bipolar Transistors (IGBTs). In high-frequency switching power supplies, the Pulse-Width Modulation (PWM) controller may not have the drive capability to directly drive the power MOSFET. A MOSFET driver, such as the MCP14A0153/4/5 family devices, can be used to provide additional source/sink current capability.

4.2 MOSFET Driver Timing

The ability of a MOSFET driver to transition from a fully OFF state to a fully ON state is characterized by the driver's rise time (t_R), fall time (t_F) and propagation delays (t_{D1} and t_{D2}). Figure 4-1 and Figure 4-2 show the test circuit and timing waveform used to verify the MCP14A0153/4/5 timing.

FIGURE 4-1: Inverting Driver Timing Waveform.

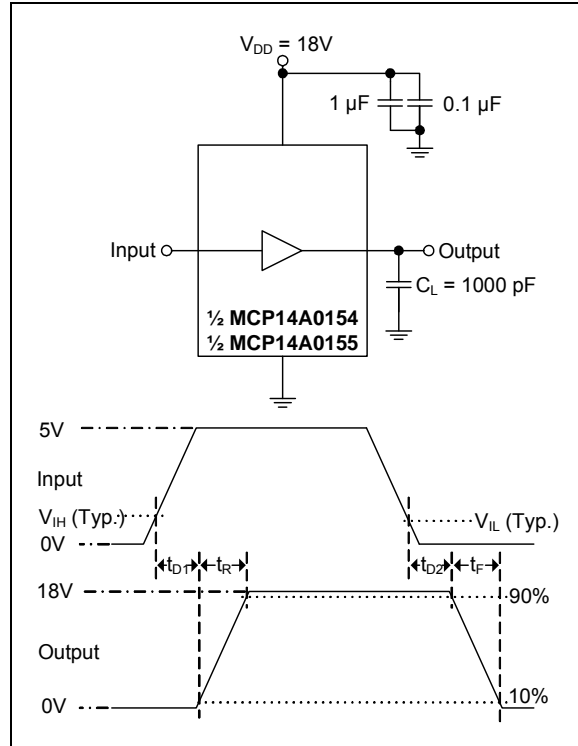

FIGURE 4-2: Non-Inverting Driver Timing Waveform.

4.3 Enable Function

The enable pins (EN A, EN B) provide additional control of the output pins (OUT). These pins are active-high and are internally pulled up to V_{DD} so that the pins can be left floating to provide standard MOSFET driver operation.

When the enable pin input voltages are above the enable pin high-voltage threshold (V_{EN_H}), the corresponding output is enabled and allowed to react to the status of the input pin. However, when the voltage applied to the enable pins falls below the low threshold voltage (V_{EN_L}), the driver's corresponding output is disabled and doesn't respond to changes in the status of the input pins. When the driver is disabled, the output is pulled down to a low state. Refer to Table 4-1 for the enable pin logic. The threshold voltage levels for the enable pin are similar to the threshold voltage levels of the input pin and are TTL compatible. Hysteresis is provided to help increase the noise immunity of the enable function, avoiding false triggers of the enable signal during driver switching.

There are propagation delays associated with the driver receiving an enable signal and the output reacting. These propagation delays, t_{D3} and t_{D4} , are graphically represented in Figure 4-3.

TABLE 4-1: ENABLE PIN LOGIC

EN	IN	$\overline{\text{OUT}}$	OUT
H	H	L	H
H	L	H	L
L	X	L	L

FIGURE 4-3: Enable Timing Waveform.

4.4 Decoupling Capacitors

Careful PCB layout and decoupling capacitors are required when using power MOSFET drivers. Large current is required to charge and discharge capacitive loads quickly. For example, approximately 720 mA are needed to charge a 1000 pF load with 18V in 25 ns.

To operate the MOSFET driver over a wide frequency range with low supply impedance, it is recommended to place 1.0 μF and 0.1 μF low-ESR ceramic capacitors in parallel between the driver V_{DD} and GND. These capacitors should be placed close to the driver to minimize circuit board parasitics and provide a local source for the required current.

4.5 PCB Layout Considerations

Proper Printed Circuit Board (PCB) layout is important in high-current, fast switching circuits to provide proper device operation and robustness of design. Improper component placement may cause errant switching, excessive voltage ringing or circuit latch-up. The PCB trace loop length and inductance should be minimized by the use of ground planes or traces under the MOSFET gate drive signal. Separate analog and power grounds, and local driver decoupling should also be used.

Placing a ground plane beneath the MCP14A0153/4/5 devices will help as a radiated noise shield, as well as providing some heat sinking for power dissipated within the device.

4.6 Power Dissipation

The total internal power dissipation in a MOSFET driver is the summation of three separate power dissipation elements, as shown in Equation 4-1.

EQUATION 4-1:

$$P_T = P_L + P_Q + P_{CC}$$

Where:

P_T = Total Power Dissipation

P_L = Load Power Dissipation

P_Q = Quiescent Power Dissipation

P_{CC} = Operating Power Dissipation

4.6.1 CAPACITIVE LOAD DISSIPATION

The power dissipation caused by a capacitive load is a direct function of the frequency, total capacitive load and supply voltage. The power lost in the MOSFET driver for a complete charging and discharging cycle of a MOSFET is shown in Equation 4-2.

EQUATION 4-2:

$$P_L = f \times C_T \times V_{DD}^2$$

Where:

f = Switching Frequency

C_T = Total Load Capacitance

V_{DD} = MOSFET Driver Supply Voltage

MCP14A0153/4/5

4.6.2 QUIESCENT POWER DISSIPATION

The power dissipation associated with the quiescent current draw depends on the state of the input and enable pins. See [Section 1.0 “Electrical Characteristics”](#) for typical quiescent current draw values in different operating states. The quiescent power dissipation is shown in [Equation 4-3](#).

EQUATION 4-3:

$$P_Q = (I_{QH} \times D + I_{QL} \times (1 - D)) \times V_{DD}$$

Where:

I_{QH} = Quiescent Current in the High State

D = Duty Cycle

I_{QL} = Quiescent Current in the Low State

V_{DD} = MOSFET Driver Supply Voltage

4.6.3 OPERATING POWER DISSIPATION

The operating power dissipation occurs each time the MOSFET driver output transitions, because for a very short period of time, both MOSFETs in the output stage are on simultaneously. This crossover current leads to a power dissipation described in [Equation 4-4](#).

EQUATION 4-4:

$$P_{CC} = V_{DD} \times I_{CO}$$

Where:

I_{CO} = Crossover Current

V_{DD} = MOSFET Driver Supply Voltage

5.0 PACKAGING INFORMATION

5.1 Package Marking Information

8-Lead MSOP (3x3 mm)

Device	Code
MCP14A0153T-E/MS	A0153
MCP14A0154T-E/MS	A0154
MCP14A0155T-E/MS	A0155

Note: Applies to 8-Lead MSOP.

Example

APPENDIX A: REVISION HISTORY

Revision B (July 2017)

The following is the list of modifications:

- Updated the [Typical Performance Curves](#).
- Updated the [Packaging Information](#).
- Various typographical edits.

Revision A (December 2015)

- Original release of this document

MCP14A0153/4/5

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>X1⁽¹⁾</u>	<u>-X</u>	<u>/XX</u>
Device	Tape and Reel	Temperature Range	Package
<p>Device:</p> <p>MCP14A0153: High-Speed MOSFET Driver</p> <p>MCP14A0154: High-Speed MOSFET Driver</p> <p>MCP14A0155: High-Speed MOSFET Driver</p> <p>MCP14A0153T: High-Speed MOSFET Driver (Tape and Reel)</p> <p>MCP14A0154T: High-Speed MOSFET Driver (Tape and Reel)</p> <p>MCP14A0155T: High-Speed MOSFET Driver (Tape and Reel)</p>			
<p>Temperature Range: E = -40°C to +125°C (Extended)</p>			
<p>Package:</p> <p>MS = 8-Lead Plastic Micro Small Outline Package (MSOP)</p> <p>SN = 8-Lead Plastic Small Outline Package (SOIC)</p> <p>MNY* = 8-Lead Plastic Dual Flat, No Lead Package - 2x3x0.8 mm Body (TDFN)</p> <p>*Y = Nickel Palladium Gold Manufacturing Designator. Only available on the TDFN package.</p>			
<p>Examples:</p> <p>a) MCP14A0153T-E/MS: Tape and Reel, Extended Temperature, 8-Lead MSOP Package</p> <p>b) MCP14A0153-E/MS: Extended Temperature, 8-Lead MSOP Package</p> <p>c) MCP14A0154T-E/SN: Tape and Reel, Extended Temperature, 8-Lead SOIC Package</p> <p>d) MCP14A0154-E/SN: Extended Temperature, 8-Lead SOIC Package</p> <p>e) MCP14A0155T-E/MNY: Tape and Reel, Extended Temperature, 8-Lead TDFN Package</p>			
<p>Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.</p>			

MCP14A0153/4/5

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
