

Ultra low drop and low noise BiCMOS voltage regulators

Datasheet - production data

Description

The LD3985 provides up to 150 mA, from 2.5 V to 6 V input voltage. The ultra low drop voltage, low quiescent current and low noise make it suitable for low power applications and in battery-powered systems. Regulator ground current increases slightly in dropout only, prolonging the battery life. Power supply rejection is better than 60 dB at low frequencies and rolls off at 10 kHz. High power supply rejection is maintained down to low input voltage levels common to battery operated circuits. Shutdown logic control function is available, this means that when the device is used as local regulator, it is possible to put a part of the board in standby, decreasing the total power consumption. The LD3985 is designed to work with low ESR ceramic capacitors. Typical applications are in mobile phones and similar battery-powered wireless systems.

1. For V_{O(NOM)} < 2 V, V_I = 2.5 V

2. For V_{O(NOM)} = 1.25 V, V_I = 2.5 V

3. Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value. This specification does not apply to input voltages below 2.5 V

4. Turn-on time is time measured between the enable input just exceeding V_{INH} high value and the output voltage just reaching 95% of its nominal value

5. Typical thermal protection hysteresis is 20 °C

6. The minimum capacitor value is 1 μF, anyway the LD3985 is still stable if the compensation capacitor has a 30% tolerance in all temperature range
