DC to 1000 MHz
IF Gain Block
ADL5530

## FEATURES

Fixed gain of 16.5 dB
Operation up to 1000 MHz
37 dBm Output Third-Order Intercept (OIP3)
3 dB noise figure
Input/output internally matched to $50 \Omega$
Stable temperature and power supply
3 V or 5 V power supply
110 mA power supply current

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

## APPLICATIONS

## VCO buffers

General purpose Tx/Rx amplification

## GENERAL DESCRIPTION

The ADL5530 is a broadband, fixed-gain, linear amplifier that operates at frequencies up to 1000 MHz . The device can be used in a wide variety of wired and wireless devices, including cellular, broadband, CATV, and LMDS/MMDS applications.

The ADL5530 provides a gain of 16.5 dB , which is stable over frequency, temperature, power supply, and from device to device. It achieves an OIP3 of 37 dBm with an output compression point of 21.8 dB and a noise figure of 3 dB .

This amplifier is single-ended and internally matched to $50 \Omega$ with an input return loss of 11 dB . Only input/output ac-coupling capacitors, a power supply decoupling capacitor, and an external inductor are required for operation.

The ADL5530 operates with supply voltages of 3 V or 5 V with a supply current of 110 mA .

The ADL5530 is fabricated on a GaAs pHEMPT process. The device is packaged in a $3 \mathrm{~mm} \times 2 \mathrm{~mm}$ LFCSP that uses an exposed paddle for excellent thermal impedance. It operates from $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$. A fully populated evaluation board is also available.

## ABSOLUTE MAXIMUM RATINGS

Table 3.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage, VPOS | 6 V |
| Input Power (re: $50 \Omega$ ) | 10 dBm |
| Internal Power Dissipation (Paddle Soldered) | 600 mW |
| $\theta_{\text {cc }}$ (Junction to Paddle) | $1544^{\circ} \mathrm{C} / \mathrm{W}$ |
| Maximum Junction Temperature | $180^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## THEORY OF OPERATION

The basic connections for operating the ADL5530 are shown in Figure 22. Recommended components are listed in Table 5. The inputs and outputs should be ac coupled with appropriately sized capacitors (device characterization was performed with 10 nF capacitors). DC bias is provided to the amplifier via an inductor connected to the RF output pin. The bias voltage should be decoupled using a 10 nF capacitor.

A bias voltage of 5 V is recommended. However, the device is specified to operate down to 3 V with a slightly reduced compression point and a reduced noise figure.

For operation down to 10 MHz , a larger biasing choke is recommended (see Table 5) along with larger ac-coupling capacitors. Figure 23 shows a plot of input return loss and gain with the recommended components.

Table 5. Recommended Components for Basic Connections

| Frequency | C1 | C2 | L1 | C5 |
| :--- | :--- | :--- | :--- | :--- |
| 10 MHz to 50 MHz | $0.1 \mu \mathrm{~F}$ | $0.1 \mu \mathrm{~F}$ | $3.3 \mu \mathrm{H}$ | $0.1 \mu \mathrm{~F}$ |
| 50 MHz to 1000 MHz | 10 nF | 10 nF | 470 nH | 10 nF |

Figure 23. Performance at 10 MHz

## SOLDERING INFORMATION AND RECOMMENDED PCB LAND PATTERN

Figure 24 shows the recommended land pattern for ADL5530. To minimize thermal impedance, the exposed paddle on the package underside should be soldered down to a ground plane along with Pin 8. If multiple ground layers exist, they should be stitched together using vias. Pin 1, Pin 3, Pin 4, Pin 5 and Pin 6 can be left unconnected, or can be connected to ground. Connecting these pins to ground slightly enhances thermal impedance.

Figure 24. Recommended Land Pattern

## ADL5530

## EVALUATION BOARD

Figure 25 shows the schematic for the ADL5530 evaluation board. The board is powered by a single supply (between 3 V and 5 V ).

The components used on the board are listed in Table 6. Power can be applied to the board through clip-on leads (J5, J6), through an edge connector (P1), or through Jumper W1. Note that IN2, OUT2, T1, T2, C6, C7 and C10 have no function. Because Pin 1, Pin 3 and Pin 6 of ADL5530 are No Connects, these pins are grounded on this PCB (this has no effect on electrical performance).

Figure 25. Evaluation Board Schematic

Figure 26. Evaluation Board Layout, Top Layer

Figure 27. Evaluation Board Layout, Bottom Layer

Table 6. Evaluation Board Configuration Options

| Component | Function | Default Value |
| :--- | :--- | :--- |
| C1, C2 | AC-coupling capacitors. | 10 nF 0402 |
| C5 | Power supply decoupling capacitor. | 10 nF 0603 |
| L1 | DC bias inductor. | 470 nH 1008 |
| J5, J6 | Clip-on terminals for power supply. | J5 = VPOS |
|  | J6 = GND |  |
