LM3509 High Efficiency Boost for White LED's and/or OLED Displays with Dual Current Sinks and I^{2}C Compatible Brightness Control

Check for Samples: LM3509

FEATURES

- **Integrated OLED Display Power Supply and LED Driver**
- **Drives up to 10 LED's at 30mA**
- **Drives up to 5 LED's at 20mA and Delivers up to 21V at 40mA**
- **Over 90% Efficient**
- **32 Exponential Dimming Steps**
- **0.15% Accurate Current Matching Between Strings**
- **Internal Soft-Start Limits Inrush Current**
- **True Shutdown Isolation for LED's**
- **Wide 2.7V to 5.5V Input Voltage Range**
- **21V Over-Voltage Protection**
- **1.27MHz Fixed Frequency Operation**
- **Low Profile 10-Pin WSON Package (3mm x 3mm x 0.8mm)**
- **General Purpose I/O**
- **Active Low Hardware Reset**

APPLICATIONS

- **Dual Display LCD Backlighting for Portable Applications**
- **Large Format LCD Backlighting**
- **OLED Panel Power Supply**

DESCRIPTION

The LM3509 current mode boost converter offers two separate outputs. The first output (MAIN) is a constant current sink for driving series white LED's. The second output (SUB/FB) is configurable as a constant current sink for series white LED bias, or as a feedback pin to set a constant output voltage for powering OLED panels.

Typical Application Circuits

Dual White LED Bias Supply

DESCRIPTION (CONTINUED)

When configured as a dual output white LED bias supply, the LM3509 adaptively regulates the supply voltage of the LED strings to maximize efficiency and insure the current sinks remain in regulation. The maximum current per output is set via a single external low power resistor. An I^{2}C compatible interface allows for independent adjustment of the LED current in either output from 0 to max current in 32 exponential steps. When configured as a white LED + OLED bias supply the LM3509 can independently and simultaneously drive a string of up to 5 white LED's and deliver a constant output voltage of up to 21V for OLED panels.

Output over-voltage protection shuts down the device if V_{OUT} rises above 21V allowing for the use of small sized low voltage output capacitors. The LM3509 is offered in a small 10-pin thermally- enhanced WSON package and operates over the -40°C to +85°C temperature range.

PIN DESCRIPTIONS

Pin	Name	Function
1	MAIN	Main Current Sink Input.
2	SUB/FB	Secondary Current Sink Input or 1.25V Feedback Connection for Constant Voltage Output.
3	SET	LED Current Setting Connection. Connect a resistor from SET to GND to set the maximum LED current into MAIN or SUB/FB (when in LED mode), where $I_{LED\_MAX} = 192 \times 1.244V/R_{SET}$.
4	VIO	Logic Voltage Level Input
5	$\overline{RESET}$/GPIO	Active Low Hardware Reset and Programmable General Purpose I/O.
6	SW	Drain Connection for Internal NMOS Switch
7	OVP	Over-Voltage Protection Sense Connection. Connect OVP to the positive terminal of the output capacitor.
8	IN	Input Voltage Connection. Connect IN to the input supply, and bypass to GND with a 1µF ceramic capacitor.

PIN DESCRIPTIONS (continued)

Pin	Name	Function
9	SDA	Serial Data Input/Output
10	SCL	Serial Clock Input
DAP	GND	Ground

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings[(1)(2)(3)]

V_{IN}	−0.3V to 6V
V_{SW}, V_{OVP},	−0.3V to 25V
$V_{SUB/FB}$, V_{MAIN}	−0.3V to 23V
V_{SCL}, V_{SDA}, $V_{\overline{RESET}\backslash GPIO}$, V_{IO}, V_{SET}	−0.3V to 6V
Continuous Power Dissipation	Internally Limited
Junction Temperature (T_{J-MAX})	+150ºC
Storage Temperature Range	-65ºC to +150º C
Maximum Lead Temperature (Soldering, 10s)[(4)]	+300°C
ESD Rating[(5)] Human Body Model	2.5kV

(1) Absolute maximum ratings are limits beyond which damages to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameter specifications may not be ensured. For ensured specifications and test conditions, see the Electrical Characteristics.
(2) If Military/Aerospace specified devices are required, please contact the Texas Instrument Sales Office/ Distributors for availability and specifications.
(3) All voltages are with respect to the potential at the GND pin.
(4) For detailed soldering specifications and information, please refer to Application Note 1187: Leadless Lead frame Package (AN-1187) (Literature Number SNOA401).
(5) The human body model is a 100pF capacitor discharged through 1.5kΩ resistor into each pin. (MIL-STD-883 3015.7).

Operating Ratings[(1)(2)]

V_{IN}	2.7V to 5.5V
V_{SW}, V_{OVP},	0V to 23V
$V_{SUB/FB}$, V_{MAIN}	0V to 21V
Junction Temperature Range (T_J)[(3)]	-40ºC to +110ºC
Ambient Temperature Range (T_A)[(4)]	-40ºC to +85ºC

(1) Absolute maximum ratings are limits beyond which damages to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameter specifications may not be ensured. For ensured specifications and test conditions, see the Electrical Characteristics.
(2) All voltages are with respect to the potential at the GND pin.
(3) Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at T_J=150ºC (typ.) and disengages at T_J=140ºC (typ.).
(4) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A-MAX}) is dependent on the maximum operating junction temperature (TJ-MAX-OP = +105ºC), the maximum power dissipation of the device in the application (P_{D-MAX}), and the junction-to ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the following equation: $T_{A-MAX} = T_{J-MAX-OP} − (\theta_{JA} \times P_{D-MAX})$.

Thermal Properties

Junction to Ambient Thermal Resistance (θ_{JA})[(1)]	54°C/W

(1) Junction-to-ambient thermal resistance (θ_{JA}) is taken from a thermal modeling result, performed under the conditions and guidelines set forth in the JEDEC standard JESD51-7. The test board is a 4-layer FR-4 board measuring 114mm x 76mm x 1.6mm with a 2x1 array of thermal vias. The ground plane on the board is 113mm x 75mm. Thickness of copper layers are 71.5µm/35µm/35µm/71.5µm (2oz/1oz/1oz/2oz). Ambient temperature in simulation is 22°C, still air. Power dissipation is 1W. The value of θ_{JA} of this product in the WSON package could fall in a range as wide as 50ºC/W to 150ºC/W (if not wider), depending on board material, layout, and environmental conditions. In applications where high maximum power dissipation exists special care must be paid to thermal dissipation issues. For more information on these topics, please refer to Application Note 1187: Leadless Leadframe Package (LLP) (Literature Number SNOA401).

Electrical Characteristics

Specifications in standard type face are for T_A = 25°C and those in **boldface type** apply over the Operating Temperature Range of T_A = −40°C to +85°C. Unless otherwise specified V_{IN} = 3.6V, V_{IO} = 1.8V, $V_{\overline{RESET}/GPIO}$ = V_{IN}, $V_{SUB/FB}$ = V_{MAIN} = 0.5V, R_{SET} = 12.0kΩ, OLED = '0', ENM = ENS = '1', BSUB = BMAIN = Full Scale.[1] [2]

Symbol	Parameter	Conditions	Min	Typ	Max	Units
I_{LED}	Output Current Regulation MAIN or SUB/FB Enabled	UNI = '0', or '1'	**18.6**	20	**21.8**	
	Maximum Current Per Current Sink	R_{SET} = 8.0kΩ		30		mA

BLOCK DIAGRAM

Figure 38. LM3509 Block Diagram

OPERATION DESCRIPTION

The LM3509 Current Mode PWM boost converter operates from a 2.7V to 5.5V input and provides two regulated outputs for White LED and OLED display biasing. The first output, MAIN, provides a constant current of up to 30mA to bias up to 5 series white LED's. The second output, SUB/FB, can be configured as a current source for up to 5 series white LED's at at 30mA, or as a feedback voltage pin to regulate a constant output voltage of up to 21V. When both MAIN and SUB/FB are configured for white LED bias the current for each LED string is controlled independently or in unison via an I²C compatible interface. When MAIN is configured for white LED bias and SUB/FB is configured as a feedback voltage pin, the current into MAIN is controlled via the I²C compatible interface and SUB/FB becomes the middle tap of a resistive divider used to regulate the output voltage of the boost converter.

The core of the LM3509 is a Current Mode Boost converter. Operation is as follows. At the start of each switching cycle the internal oscillator sets the PWM converter. The converter turns the NMOS switch on, allowing the inductor current to ramp while the output capacitor supplies power to the white LED's and/or OLED panel. The error signal at the output of the error amplifier is compared against the sensed inductor current. When the sensed inductor current equals the error signal, or when the maximum duty cycle is reached, the NMOS switch turns off causing the external Schottky diode to pick up the inductor current. This allows the inductor current to ramp down causing its stored energy to charge the output capacitor and supply power to the load. At the end of the clock period the PWM controller is again set and the process repeats itself.

Adaptive Regulation

When biasing dual white led strings (White LED mode) the LM3509 maximizes efficiency by adaptively regulating the output voltage. In this configuration the 500mV reference is connected to the non-inverting input of the error amplifier via mux S2 (see Figure 38). The lowest of either V_{MAIN} or $V_{SUB/FB}$ is then applied to the inverting input of the error amplifier via mux S1. This ensures that V_{MAIN} and $V_{SUB/FB}$ are at least 500mV, thus providing enough voltage headroom at the input to the current sinks for proper current regulation.

In the instance when there are unequal numbers of LEDs or unequal currents from string to string, the string with the highest voltage will be the regulation point.

Unison/Non-Unison Mode

Within White LED mode there are two separate modes of operation, Unison and Non-Unison. Non-Unison mode provides for independent current regulation, while Unison mode gives up independent regulation for more accurate matching between LED strings. When in Non-Unison mode the LED currents I_{MAIN} and $I_{SUB/FB}$ are independently controlled via registers BMAIN and BSUB respectively (see Brightness Registers (BMAIN and BSUB) section). When in Unison mode BSUB is disabled and both I_{MAIN} and $I_{SUB/FB}$ are controlled via BMAIN only.

Start-Up

The LM3509 features an internal soft-start, preventing large inrush currents during start-up that can cause excessive voltage ripple on the input. For the typical application circuits when the device is brought out of shutdown the average input current ramps from zero to 450mA in 1.2ms. See Start Up Plots in the Typical Performance Characteristics.

OLED Mode

When the LM3509 is configured for a single White LED bias + OLED display bias (OLED mode), the non-inverting input of the error amplifier is connected to the internal 1.21V reference via MUX S2. MUX S1 switches SUB/FB to the inverting input of the error amplifier while disconnecting the internal current sink at SUB/FB. The voltage at MAIN is not regulated in OLED mode so when the application requires white LED + OLED panel biasing, ensure that at least 300mV of headroom is maintained at MAIN to guarantee proper regulation of I_{MAIN}. (see the Typical Performance Characteristics for a plot of I_{LED} vs Current Source Headroom Voltage)

Peak Current Limit

The LM3509's boost converter has a peak current limit for the internal power switch of 770mA typical (650mA minimum). When the peak switch current reaches the current limit the duty cycle is terminated resulting in a limit on the maximum output current and thus the maximum output power the LM3509 can deliver. Calculate the maximum LED current as a function of V_{IN}, V_{OUT}, L and I_{PEAK} as:

$$I_{OUT\_MAX} = \frac{(I_{PEAK} - \Delta I_L) \times \eta \times V_{IN}}{V_{OUT}}$$

where

$$\Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}}$$

(1)

f_{SW} = 1.27MHz. Typical values for efficiency and I_{PEAK} can be found in the efficiency and I_{PEAK} curves in the Typical Performance Characteristics.

Over Voltage Protection

The LM3509's output voltage (V_{OUT}) is limited on the high end by the Output Over-Voltage Protection Threshold (V_{OVP}) of 21.2V. In White LED mode during output open circuit conditions the output voltage will rise to the over voltage protection threshold (V_{OVP} = 21.2V min). When this happens the controller will stop switching causing V_{OUT} to droop. When the output voltage drops below 19.7V (min) the device will resume switching. If the device remains in an over voltage condition the LM3509 will repeat the cycle causing the output to cycle between the high and low OVP thresholds. See waveform for OVP condition in the Typical Performance Characteristics.

Product Folder Links: *LM3509*

Output Current Accuracy and Current Matching

The LM3509 provides both precise current accuracy (% error from ideal value) and accurate current matching between the MAIN and SUB/FB current sinks. Two modes of operation affect the current matching between I_{MAIN} and $I_{SUB/FB}$. The first mode (Non-Unison mode) is set by writing a 0 to bit 2 of the General Purpose register (UNI bit). Non-Unison mode allows for independent programming of I_{MAIN} and $I_{SUB/FB}$ via registers BMAIN and BSUB respectively. In this mode typical matching between current sinks is 1%.

Writing a 1 to UNI configures the device for Unison mode. In Unison mode, BSUB is disabled and I_{MAIN} and $I_{SUB/FB}$ are both controlled via register BMAIN. In this mode typical matching is 0.15%.

Light Load Operation

The LM3509 boost converter operates in three modes; continuous conduction, discontinuous conduction, and skip mode operation. Under heavy loads when the inductor current does not reach zero before the end of the switching period the device switches at a constant frequency. As the output current decreases and the inductor current reaches zero before the end of the switching cycle, the device operates in discontinuous conduction. At very light loads the LM3509 will enter skip mode operation causing the switching period to lengthen and the device to only switch as required to maintain regulation at the output.

Active Low Reset/General Purpose I/O ($\overline{\text{RESET}}$\GPIO)

The $\overline{\text{RESET}}$/GPIO serves as an active low reset input or as a general-purpose logic input/output. Upon power-up of the device $\overline{\text{RESET}}$/GPIO defaults to the active low reset mode. The functionality of $\overline{\text{RESET}}$/GPIO is set via the GPIO register and is detailed in Table 6. When configured as an active low reset input, (Bit 0 = 0), pulling $\overline{\text{RESET}}$/GPIO low automatically programs all registers of the LM3509 with 0x00. Their state cannot be changed until $\overline{\text{RESET}}$/GPIO is pulled high. The General Purpose I/O (GPIO) register is used to enable the GPIO function of the $\overline{\text{RESET}}$/GPIO pin. The GPIO register is an 8-bit register with only the 3 LSB's active. The 5 MSB's are not used. When configured as an output, $\overline{\text{RESET}}$/GPIO is open drain and requires an external pull-up resistor.

Thermal Shutdown

The LM3509 offers a thermal shutdown protection. When the die temperature reaches +140°C the device will shutdown and not turn on again until the die temperature falls below +120°C.

I²C Compatible Interface

The LM3509 is controlled via an I²C compatible interface. START and STOP conditions classify the beginning and the end of the I²C session. A START condition is defined as SDA transitioning from HIGH to LOW while SCL is HIGH. A STOP condition is defined as SDA transitioning from LOW to HIGH while SCL is HIGH. The I²C master always generates START and STOP conditions. The I²C bus is considered busy after a START condition and free after a STOP condition. During data transmission, the I²C master can generate repeated START conditions. A START and a repeated START conditions are equivalent function-wise. The data on SDA must be stable during the HIGH period of the clock signal (SCL). In other words, the state of SDA can only be changed when SCL is LOW.
Figure 39. Start and Stop Sequences

Submit Documentation Feedback   15

I²C Compatible Address

The chip address for the LM3509 is 0110110 (36h). After the START condition, the I²C master sends the 7-bit chip address followed by a read or write bit (R/W). R/W= 0 indicates a WRITE and R/W = 1 indicates a READ. The second byte following the chip address selects the register address to which the data will be written. The third byte contains the data for the selected register.

I²C Slave Address (chip address)
Figure 40. Chip Address

Transferring Data

Every byte on the SDA line must be eight bits long, with the most significant bit (MSB) transferred first. Each byte of data must be followed by an acknowledge bit (ACK). The acknowledge related clock pulse (9th clock pulse) is generated by the master. The master releases SDA (HIGH) during the 9th clock pulse. The LM3509 pulls down SDA during the 9th clock pulse, signifying an acknowledge. An acknowledge is generated after each byte has been received. Figure 41 is an example of a write sequence to the General Purpose register of the LM3509.
Figure 41. Write Sequence to the LM3509

Register Descriptions

There are 4, 8 bit registers within the LM3509 as detailed in Table 1.

Table 1. LM3509 Register Descriptions

Register Name	Hex Address	Power -On-Value
General Purpose (GP)	10	0xC0
Brightness Main (BMAIN)	A0	0xE0
Brightness Sub (BSUB)	B0	0xE0
General Purpose I/O (GPIO)	80	0XF8

General Purpose Register (GP)

The General Purpose register has four functions. It controls the on/off state of MAIN and SUB/FB, it selects between Unison or Non-Unison mode, provides for control over the rate of change of the LED current (see Brightness Rate of Change Description), and selects between White LED and OLED mode. Figure 42 and Table 2 describes each bit available within the General Purpose Register.

General Purpose Register
Register Address 0x10

MSB							LSB
1 Bit 7	1 Bit 6	OLED Bit 5	RMP1 Bit 4	RMP0 Bit 3	UNI Bit 2	ENS Bit 1	ENM Bit 0
Figure 42. General Purpose Register Description

Table 2. General Purpose Register Bit Function

Bit	Name	Function	Power-On-Value
0	ENM	Enable MAIN. Writing a 1 to this bit enables the main current sink (MAIN). Writing a 0 to this bit disables the main current sink and forces MAIN high impedance.	0
1	ENS	Enable SUB/FB. Writing a 1 to this bit enables the secondary current sink (SUB/FB). Writing a 0 to this bit disables the secondary current sink and forces SUB/FB high impedance.	0
2	UNI	Unison Mode Select. Writing a 1 to this bit disables the BSUB register and causes the contents of BMAIN to set the current in both the MAIN and SUB/FB current sinks. Writing a 0 to this bit allows the current into MAIN and SUB/FB to be independently controlled via the BMAIN and BSUB registers respectively.	0
3	RMP0	Brightness Rate of Change. Bits RMP0 and RMP1 set the rate of change of the LED current into MAIN and SUB/FB in response to changes in the contents of registers BMAIN and BSUB (see Brightness Rate of Change Description).	0
4	RMP1		0
5	OLED	OLED = 0 places the LM3509 in White LED mode. In this mode both the MAIN and SUB/FB current sinks are active. The boost converter ensures there is at least 500mV at V_{MAIN} and $V_{SUB/FB}$. OLED = 1 places the LM3509 in OLED mode. In this mode the boost converter regulates $V_{SUB/FB}$ to 1.25V. V_{MAIN} is unregulated and must be > 400mV for the MAIN current sink to maintain current regulation.	0
6	Don't Care	These are non-functional read only bits. They will always read back as a 1.	1
7			

Table 3. Operational Truth Table

UNI	OLED	ENM	ENS	Result
X	0	0	0	LM3509 Disabled
1	0	1	X	MAIN and SUB/FB current sinks enabled. Current levels set by contents of BMAIN.
1	0	0	X	MAIN and SUB/FB Disabled
0	0	0	1	SUB/FB current sink enabled. Current level set by BSUB.
0	0	1	0	MAIN current sink enabled. Current level set by BMAIN.
0	0	1	1	MAIN and SUB/FB current sinks enabled. Current levels set by contents of BMAIN and BSUB respectively.
X	1	1	X	SUB/FB current sink disabled (SUB/FB configured as a feedback pin). MAIN current sink enabled current level set by BMAIN.
X	1	0	X	SUB/FB current sink disabled (SUB/FB configured as a feedback pin). MAIN current sink disabled.

* ENM ,ENS, or OLED high enables analog circuitry.

Brightness Registers (BMAIN and BSUB)

With the UNI bit (General Purpose register) set to 0 (Non-Unison mode) both brightness registers (BMAIN and BSUB) independently control the LED currents I_{MAIN} and $I_{SUB/FB}$ respectively. BMAIN and BSUB are both 8 bit, but with only the 5 LSB's controlling the current. The three MSB's are don't cares. The LED current control is designed to approximate an exponentially increasing response of the LED current vs increasing code in either BMAIN or BSUB (see Figure 45). Program I_{LED_MAX} by connecting a resistor (RSET) from SET to GND, where:

Product Folder Links: LM3509

$$I_{LED\_MAX} = 192 \times \frac{1.244V}{R_{SET}}$$

(2)

With the UNI bit (General Purpose register) set to 1 (Unison mode), BSUB is disabled and BMAIN sets both I_{MAIN} and $I_{SUB/FB}$. This prevents the independent control of I_{MAIN} and $I_{SUB/FB}$, however matching between current sinks goes from typically 1%(with UNI = 0) to typically 0.15% (with UNI = 1). Figure 43 and Figure 44 show the register descriptions for the Brightness MAIN and Brightness SUB registers. Table 4 and Figure 45 show I_{MAIN} and/or $I_{SUB/FB}$ vs. brightness data as a percentage of I_{LED_MAX}.

Product Folder Links: *LM3509*

* t_{STEP} is the time between LED current steps programmed via bits RMP0, RMP1
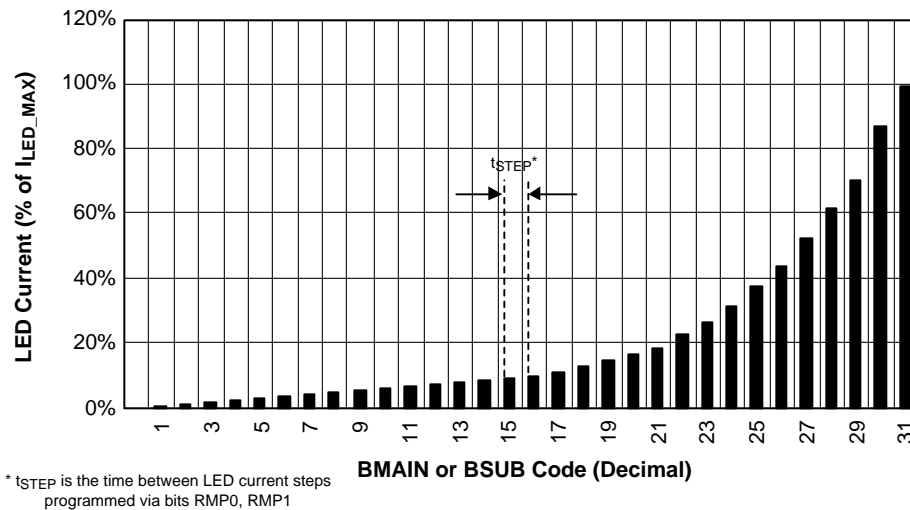

Figure 45. I_{MAIN} or I_{SUB} vs BMAIN or BSUB Data

Brightness Rate of Change Description

RMP0 and RMP1 control the rate of change of the LED current I_{MAIN} and $I_{SUB/FB}$ in response to changes in BMAIN and /or BSUB. There are 4 user programmable LED current rates of change settings for the LM3509 (see Table 5).

Table 5. Rate of Change Bits

RMP0	RMP1	Change Rate (t_{STEP})
0	0	51µs/step
0	1	13ms/step
1	0	26ms/step
1	1	52ms/step

For example, if R_{SET} = 12kΩ then I_{LED_MAX} = 20mA. With the contents of BMAIN set to 0x1F (I_{MAIN} = 20mA), suppose the contents of BMAIN are changed to 0x00 resulting in (I_{MAIN} = 0mA). With RMP0 =1 and RMP1 = 1 (52ms/step), I_{MAIN} will change from 20mA to 0mA in 31 steps with 52ms elapsing between steps, excluding the step from 0x1F to 0x1E, resulting in a full scale current change in 1560ms. The total time to transition from one brightness code to another is:

$$t_{transition} = (|InitialCode - FinalCode| - 1) \times t_{STEP}$$

(3)

The following 3 additional examples detail possible scenarios when using the brightness register in conjunction with the rate of change bits and the enable bits.

Example 1:

Step 1: Write to BMAIN a value corresponding to I_{MAIN} = 20mA.

Step 2: Write 1 to ENM (turning on MAIN)

Step 3: I_{MAIN} ramps to 20mA with a rate set by RMP0 and RMP1. (RMP0 and RMP1 bits set the duration spent at one brightness code before incrementing to the next).

Step 4: ENM is set to 0 before 20mA is reached, thus the LED current fades off at a rate given by RMP0 and RMP1 without I_{MAIN} going up to 20mA.

Example 2:

Step 1: ENM is 1, and BMAIN has been programmed with code 0x01. This results in a small current into MAIN.

Step 2: BMAIN is programmed with 0x1F (full scale current). This causes I_{MAIN} to ramp toward full-scale at the rate selected by RMP0 and RMP1.

Step 3: Before I_{MAIN} reaches full-scale BMAIN is programmed with 0x09. I_{MAIN} will continue to ramp to full scale.

Step 4: When I_{MAIN} has reached full-scale value it will ramp down to the current corresponding to 0x09 at a rate set by RMP0 and RMP1.

Example 3:

Step 1: Write to BMAIN a value corresponding to I_{MAIN} = 20mA.

Step 2: Write a 1 to both RMP0 and RMP1.

Step 3: Write 1 to ENM (turning on MAIN).

Step 4: I_{MAIN} ramps toward 20mA with a rate set by RMP0 and RMP1. (RMP0 and RMP1 bits set the duration spent at one brightness code before incrementing to the next).

Step 5: After 1.04s I_{MAIN} has ramped to 16.875% of I_{LED_MAX} ($0.16875 \times 20mA = 3.375mA$). Simultaneously, RMP0 and RMP1 are both programmed with 0.

Step 6: I_{MAIN} continues ramping from 3.375mA to 20mA, but at a new ramp rate of 51µs/step.

Table 6. GPIO Register Function

Bits 7 – 3	Data (Bit 2)	Mode (Bit 1)	Enable GPIO (Bit 0)	Function
X	X	X	0	RESET/GPIO is configured as an active low reset input. This is the default power on state.
X	Logic Input	0	1	RESET/GPIO is configured as a logic input. The logic level applied to RESET/GPIO can be read via bit 2 of the GPIO register.
X	Logic Output	1	1	RESET/GPIO is configured as a logic output. A 0 in bit 2 forces RESET/GPIO low. A 1 in bit 2 forces RESET/GPIO high impedance.

Figure 46. GPIO Register Description

Shutdown and Output Isolation

The LM3509 provides a true shutdown for either MAIN or SUB/FB when configured as a White LED bias supply. Write a 0 to ENM (bit 1) of the General Purpose register to turn off the MAIN current sink and force MAIN high impedance. Write a 0 to ENS (bit 2) of the General Purpose register to turn off the SUB/FB current sink and force SUB/FB high impedance. Writing a 1 to ENM or ENS turns on the MAIN and SUB/FB current sinks respectively. When in shutdown the leakage current into MAIN or SUB/FB is typically 3.6µA. See Typical Performance Characteristics Plots for start-up responses of the LM3509 using the ENM and ENS bits in White LED and OLED modes.

Application Information

LED Current Setting/Maximum LED Current

Connect a resistor (R_{SET}) from SET to GND to program the maximum LED current (I_{LED_MAX}) into MAIN or SUB/FB. The R_{SET} to I_{LED_MAX} relationship is:

$$I_{LED\_MAX} = 192 \times \frac{1.244V}{R_{SET}}$$

(4)

where SET provides the constant 1.244V output.

Output Voltage Setting (OLED Mode)

Connect Feedback resistors from the converters output to SUB/FB to GND to set the output voltage in OLED mode (see R1 and R2 in the Typical Application Circuits (OLED Panel Power Supply). First select R2 < 100kΩ then calculate R1 such that:

$$R1 = R2\left(\frac{V_{OUT}}{1.21V} - 1\right)$$

(5)

In OLED mode the MAIN current sink continues to regulate the current through MAIN, however, V_{MAIN} is no longer regulated. To avoid dropout and ensure proper current regulation the application must ensure that $V_{MAIN} > 0.3V$.

Input Capacitor Selection

Choosing the correct size and type of input capacitor helps minimize the input voltage ripple caused by the switching of the LM3509's boost converter. For continuous inductor current operation the input voltage ripple is composed of 2 primary components, the capacitor discharge (delta V_Q) and the capacitor's equivalent series resistance (delta V_{ESR}). These ripple components are found by:

$$\Delta V_Q = \frac{\Delta I_L \times D}{2 \times f_{SW} \times C_{IN}}$$

and

$$\Delta V_{ESR} = 2 \times \Delta I_L \times R_{ESR}$$

$$\text{where } \Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}}$$

(6)

In the typical application circuit a 1µF ceramic input capacitor works well. Since the ESR in ceramic capacitors is typically less than 5mΩ and the capacitance value is usually small, the input voltage ripple is primarily due to the capacitive discharge. With larger value capacitors such as tantalum or aluminum electrolytic the ESR can be greater than 0.5Ω. In this case the input ripple will primarily be due to the ESR.

Output Capacitor Selection

The LM3509's output capacitor supplies the LED current during the boost converters on time. When the switch turns off the inductor energy is discharged through the diode supplying power to the LED's and restoring charge to the output capacitor. This causes a sag in the output voltage during the on time and a rise in the output voltage during the off time. The output capacitor is therefore chosen to limit the output ripple to an acceptable level depending on LED or OLED panel current requirements and input/output voltage differentials. For proper operation ceramic output capacitors ranging from 1µF to 2.2µF are required.

As with the input capacitor, the output voltage ripple is composed of two parts, the ripple due to capacitor discharge (delta V_Q) and the ripple due to the capacitors ESR (delta V_{ESR}). For continuous conduction mode, the ripple components are found by:

Product Folder Links: LM3509

$$\Delta V_Q = \frac{I_{LED} \times (V_{OUT} - V_{IN})}{f_{SW} \times V_{OUT} \times C_{OUT}} \quad \text{and}$$

$$\Delta V_{ESR} = R_{ESR} \times \left(\frac{I_{LED} \times V_{OUT}}{V_{IN}} + \Delta I_L \right)$$

where $\quad \Delta I_L = \dfrac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}}$

(7)

Table 7 lists different manufacturers for various capacitors and their case sizes that are suitable for use with the LM3509. When configured as a dual output LED driver a 1µF output capacitor is adequate. In OLED mode for output voltages above 12V a 2.2µF output capacitor is required.

Table 7. Recommended Output Capacitors

Manufacturer	Part Number	Value	Case Size	Voltage Rating
TDK	C1608X5R1E105M	1µF	0603	25V
Murata	GRM39X5R105K25D539	1µF	0603	25V
TDK	C2012X5R1E225M	2.2µF	0805	25V
Murata	GRM219R61E225KA12	2.2µF	0805	25V

Inductor Selection

The LM3509 is designed for use with a 10µH inductor, however 22µH are suitable providing the output capacitor is increased 2✕'s. When selecting the inductor ensure that the saturation current rating (I_{SAT}) for the chosen inductor is high enough and the inductor is large enough such that at the maximum LED current the peak inductor current is less than the LM3509's peak switch current limit. This is done by choosing:

$$I_{SAT} > \frac{I_{LED}}{\eta} \times \frac{V_{OUT}}{V_{IN}} + \Delta I_L \quad \text{where}$$

$$\Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}} \text{ , and}$$

$$L > \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times V_{OUT} \times \left(I_{PEAK} - \dfrac{I_{LED\_MAX} \times V_{OUT}}{\eta \times V_{IN}} \right)}$$

(8)

Values for I_{PEAK} can be found in the plot of peak current limit vs. V_{IN} in the Typical Performance Characteristics graphs. Table 8 shows possible inductors, as well as their corresponding case size and their saturation current ratings.

Table 8. Recommended Inductors

Manufacturer	Part Number	Value	Dimensions	I_{SAT}	DC Resistance
TDK	VLF3012AT-100MR49	10µH	2.6mm×2.8mm×1mm	490mA	0.36Ω
TDK	VLF4012AT-100MR79	10µH	3.5mm×3.7mm×1.2mm	800mA	0.3Ω
TOKO	A997AS-100M	10µH	3.8mm×3.8mm×1.8mm	580mA	0.18Ω

Product Folder Links: *LM3509*

Diode Selection

The output diode must have a reverse breakdown voltage greater than the maximum output voltage. The diodes average current rating should be high enough to handle the LM3509's output current. Additionally, the diodes peak current rating must be high enough to handle the peak inductor current. Schottky diodes are recommended due to their lower forward voltage drop (0.3V to 0.5V) compared to (0.6V to 0.8V) for PN junction diodes. If a PN junction diode is used, ensure it is the ultra-fast type (trr < 50ns) to prevent excessive loss in the rectifier. For Schottky diodes the B05030WS (or equivalent) work well for most designs. See Table 9 for a list of other Schottky Diodes with similar performance.

Table 9. Recommended Schottky Diodes

Manufacturer	Part Number	Package	Reverse Breakdown Voltage	Average Current Rating
Diodes Inc.	B05030WS	SOD-323	30V	0.5A
Philips	BAT760	SOD-323	23V	1A
ON Semiconductor	NSR0320MW2T	SOD-323	30V	1A

Output Current Range (OLED Mode)

The maximum output current the LM3509 can deliver in OLED mode is limited by 4 factors (assuming continuous conduction); the peak current limit of 770mA (typical), the inductor value, the input voltage, and the output voltage. Calculate the maximum output current (I_{OUT_MAX}) using the following equation:

$$I_{OUT\_MAX} = \frac{(I_{PEAK} - \Delta I_L) \times \eta \times V_{IN}}{V_{OUT}}$$

where

$$\Delta I_L = \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times f_{SW} \times L \times V_{OUT}}$$

(9)

For the typical application circuit with V_{OUT} = 18V and assuming 70% efficiency, the maximum output current at V_{IN} = 2.7V will be approximately 70mA. At 4.2V due to the shorter on times and lower average input currents the maximum output current (at 70% efficiency) jumps to approximately 105mA. Figure 47 shows a plot of I_{OUT_MAX} vs. V_{IN} using the above equation, assuming 80% efficiency. In reality factors such as current limit and efficiency will vary over V_{IN}, temperature, and component selection. This can cause the actual I_{OUT_MAX} to be higher or lower.

Figure 47. Typical Maximum Output Current in OLED Mode

Output Voltage Range (OLED Mode)

The LM3509's output voltage is constrained by 2 factors. On the low end it is limited by the minimum duty cycle of 10% (assuming continuous conduction) and on the high end it is limited by the over voltage protection threshold (V_{OVP}) of 22V (typical). In order to maintain stability when operating at different output voltages the output capacitor and inductor must be changed. Refer to Table 10 for different V_{OUT}, C_{OUT}, and L combinations.

Table 10. Component Values for Output Voltage Selection

V_{OUT}	C_{OUT}	L	V_{IN} Range
18V	2.2µF	10µH	2.7V to 5.5V
15V	2.2µF	10µH	2.7V to 5.5V
12V	4.7µF	10µH	2.7V to 5.5V
9V	10µF	10µH	2.7V to 5.5V
7V	10µF	4.7µH	2.7V to 5.5V
5V	22µF	4.7µH	2.7V to 4.5V

Layout Considerations

The WSON is a leadless package with very good thermal properties. This package has an exposed DAP (die attach pad) at the underside center of the package measuring 1.6mm x 2.0mm. The main advantage of this exposed DAP is to offer low thermal resistance when soldered to the thermal ground pad on the PCB. For good PCB layout a 1:1 ratio between the package and the PCB thermal land is recommended. To further enhance thermal conductivity, the PCB thermal ground pad may include vias to a 2nd layer ground plane. For more detailed instructions on mounting WSON packages, please refer to Texas Instrument Application Note AN-1187 (Literature Number SNOA401).

The high switching frequencies and large peak currents make the PCB layout a critical part of the design. The proceeding steps must be followed to ensure stable operation and proper current source regulation.

1. Divide ground into two planes, one for the return terminals of C_{OUT}, C_{IN} and the I[2]C Bus, the other for the return terminals of R_{SET} and the feedback network. Connect both planes to the exposed PAD, but nowhere else.
2. Connect the inductor and the anode of D1 as close together as possible and place this connection as close as possible to the SW pin. This reduces the inductance and resistance of the switching node which minimizes ringing and excess voltage drops. This will improve efficiency and decrease noise that can get injected into the current sources.
3. Connect the return terminals of the input capacitor and the output capacitor as close as possible to the exposed PAD and through low impedance traces.
4. Bypass IN with at least a 1µF ceramic capacitor. Connect the positive terminal of this capacitor as close as possible to IN.
5. Connect C_{OUT} as close as possible to the cathode of D1. This reduces the inductance and resistance of the output bypass node which minimizes ringing and the excess voltage drops. This will improving efficiency and decrease noise that can get injected into the current sources.
6. Route the traces for R_{SET} and the feedback divider away from the SW node to minimize noise injection.
7. Do not connect any external capacitance to the SET pin.

REVISION HISTORY

Changes from Revision C (May 2013) to Revision D   **Page**

*   Changed layout of National Data Sheet to TI format 24

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

PACKAGE MATERIALS INFORMATION

TAPE AND REEL INFORMATION

REEL DIMENSIONS

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE
