

ADS123x 2- and 4-Channel, 24-Bit, Delta-Sigma ADCs for Bridge Sensors

1 Features

- Complete front-end for bridge sensors
- 23.5-bits effective resolution at gain = 1
- 19.2-bits noise-free resolution at gain = 64
- Low-noise PGA
- Selectable gains of 1, 2, 64, and 128
- RMS noise:
 - 17 nV at 10 SPS at gain = 128
 - 44 nV at 80 SPS at gain = 128
- 100-dB simultaneous 50-Hz and 60-Hz rejection
- Flexible clocking:
 - Low-drift internal oscillator
 - Optional external crystal
- Selectable 10-SPS or 80-SPS data rates
- Easy ratiometric measurements:
 - External voltage reference up to 5 V
- Two-channel differential input with internal temperature sensor (ADS1232)
- Four-channel differential input (ADS1234)
- Two-wire serial interface
- Supply voltage range: 2.7 V to 5.3 V
- Temperature range: –40°C to +105°C
- Packages: TSSOP-24 (ADS1232) or TSSOP-28 (ADS1234)

2 Applications

- [Weigh scales](#)
- [PLC weight modules](#)
- [Pressure sensors](#)

3 Description

The ADS1232 and ADS1234 (ADS123x) are precision, 24-bit, analog-to-digital converters (ADCs). With a low-noise programmable gain amplifier (PGA), a precision delta-sigma ADC, and internal oscillator, the ADS123x provide a complete front-end solution for bridge sensor applications including weigh scales, strain gauges, and pressure sensors.

An input multiplexer (MUX) accepts either two (ADS1232) or four (ADS1234) differential inputs. The ADS1232 also includes a temperature sensor to monitor ambient temperature. The low-noise PGA has a selectable gain of 1, 2, 64, or 128, supporting a full-scale differential input of ± 2.5 V, ± 1.25 V, ± 39 mV, or ± 19.5 mV.

The delta-sigma ADC provides a maximum of 23.5-bits effective resolution, and supports two data rates: 10 SPS (providing 50-Hz and 60-Hz rejection) and 80 SPS. The ADS123x can be clocked externally using an oscillator or a crystal, or by the internal oscillator.

Offset calibration is performed on-demand, and the ADS123x can be put in a low-power standby mode or shut off completely in power-down mode. The ADS123x are operated through simple pin-driven control—there are no digital registers to program.

Data are output over a two-wire serial interface that connects directly to the MSP430 and other microcontrollers.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADS1232	TSSOP (24)	7.80 mm × 4.40 mm
ADS1234	TSSOP (28)	9.70 mm × 4.40 mm

(1) For all available packages, see the package option addendum at the end of the data sheet.

NOTE: (1) A1 for ADS1234, TEMP for ADS1232.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (February 2008) to Revision G (January 2021)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document	1
• Added Device Information, ESD Ratings, Recommended Operating Conditions, and Thermal Information tables, and Detailed Description, Application and Implementation, Power Supply Recommendations, Layout, Device and Documentation Support, and Mechanical, Packaging, and Orderable Information sections.....	1
• Deleted Ordering Information section; all ordering information available in package option addendum located at end of data sheet.....	4
• Added analog input voltage specification to Absolute Maximum Ratings	6
• Added digital input voltage specification to Absolute Maximum Ratings	6
• Deleted momentary input current specification from Absolute Maximum Ratings	6
• Added input current note to Absolute Maximum Ratings	6
• Added common-mode voltage condition to Common-Mode Rejection specification in Electrical Characteristics table.....	8
• Deleted power-supply rejection (gain = 1) MIN specification from Electrical Characteristics table	8
• Changed power-supply rejection (gain = 1) TYP specification in Electrical Characteristics table	8
• Changed text in Analog Inputs (AINPX, AINNX) section.....	16
• Added ADS1232 Input Channel Selection With A0 and TEMP table.....	16
• Deleted link to Using the MSC121x as a High-Precision Intelligent Temperature Sensor	17
• Changed 10 SPS –3-dB frequency from 3.32 Hz to 2.4 Hz, and 80 SPS –3-dB frequency from 11.64 Hz to 19 Hz.....	21
• Changed Power-Up Sequence section.....	27
• Deleted Thermocouple application from Application Information	29
• Deleted RTDs and Thermistor application from Application Information	29
• Added weigh scale application to Application Information	29

Changes from Revision E (October 2007) to Revision F (February 2008)	Page
• Changed ΔV condition in Common-Mode Rejection specification in Electrical Characteristics table.....	8
• Changed AVDD to deltaV in Power-Supply Rejection section in Electrical Characteristics table.....	8

Changes from Revision D (September 2007) to Revision E (October 2007)	Page
• Corrected unit values in <i>Electrical Characteristics</i> table.....	8

Changes from Revision C (June 2006) to Revision D (September 2007)	Page
• Deleted Logic Level V_{IH} row for CLKIN/XTAL test condition in <i>Electrical Characteristics</i> table.....	8
• Added offset drift and gain drift histogram plots (Figure 6-9 to Figure 6-16) to <i>Typical Characteristics</i>	10
• Changed difference voltage output for PGA = 2 from 323.4mV to 223.4mV in <i>Temperature Sensor</i> section..	17
• Added text to <i>Voltage Reference Inputs</i> section regarding reference and drift noise.....	19
• Changed Z_{EFF} equation.....	19
• Changed <i>Simplified Reference Input Circuitry</i> figure	19
• Changed Figure 8-4	20
• Changed text in <i>Settling Time</i> section.....	22
• Changed Figure 8-7	22
• Changed Figure 8-8	22
• Deleted 2nd sentence of <i>Serial Clock Input</i> section.....	23
• Added <i>Power-Up Sequence</i> section, with new text and two new figures.....	27
• Changed <i>Weigh-Scale Application</i> figure	29

Changes from Revision B (September 2005) to Revision C (June 2006)	Page
• Deleted last row from <i>Absolute Maximum Ratings</i> table.....	6
• Changed <i>Analog Inputs</i> section of <i>Electrical Characteristics</i> table.....	8
• Changed the typical value in last row of <i>Voltage Reference Input</i> section of <i>Electrical Characteristics</i> table....	8
• Added note 1 to Table 7-1 , Table 7-2 , Table 7-3 , and Table 7-4	15
• Changed fourth sentence in <i>Temperature Sensor</i> section.....	17
• Added fifth and sixth sentences to <i>Temperature Sensor</i> section.....	17
• Added fourth and fifth sentences to <i>Low-Noise PGA</i> section.....	18
• Changed Figure 8-2	18
• Changed t_{11} to t_{10} in third paragraph of <i>Standby Mode</i> section.....	25
• Changed min and max variables of t_{10} row in table below Figure 8-12	25
• Changed <i>Wake-Up Timing From Power-Down Mode</i> figure.....	27
• Added last row and second footnote to table below <i>Wake-Up Timing From Power-Down Mode</i> figure.....	27

5 Pin Configuration and Functions

Figure 5-1. ADS1232 PW Package, 24-Pin TSSOP, Top View

Figure 5-2. ADS1234 PW Package, 28-Pin TSSOP, Top View

Table 5-1. Pin Functions

NAME	PIN		TYPE	DESCRIPTION
	ADS1232	ADS1234		
A0	8	8	Digital input	Input MUX select pins. See Table 8-1 and Table 8-2 for more information.
A1	—	7	Digital input	Input MUX select pins. See Table 8-1 and Table 8-2 for more information.
AGND	17	21	Analog	Analog ground
AINN1	12	12	Analog input	Negative analog input channel 1
AINN2	13	17	Analog input	Negative analog input channel 2
AINN3	—	14	Analog input	Negative analog input channel 3
AINN4	—	15	Analog input	Negative analog input channel 4
AINP1	11	11	Analog input	Positive analog input channel 1
AINP2	14	18	Analog input	Positive analog input channel 2
AINP3	—	13	Analog input	Positive analog input channel 3
AINP4	—	16	Analog input	Positive analog input channel 4
AVDD	18	22	Analog	Analog power supply: 2.7 V to 5.3 V
CAP	9, 10	9, 10	Analog	PGA bypass, connect a 0.1-μF capacitor to pins 9 and 10
CLKIN/XTAL1	3	3	Digital input	External crystal connection 1, or external clock input, or tie low to activate internal oscillator. See the Clock Sources section for more information.
DGND	2, 5, 6	2, 5, 6	Digital	Digital ground
DRDY/DOUT	24	28	Digital output	Dual-purpose output: <i>Data ready</i> indicates valid data by going low. <i>Data output</i> outputs data, MSB first, on the first rising edge of SCLK.
DVDD	1	1	Digital	Digital power supply: 2.7 V to 5.3 V
GAIN0	19	23	Digital input	Gain select pins. See the Low-Noise PGA section for more information.
GAIN1	20	24	Digital input	Gain select pins. See the Low-Noise PGA section for more information.
REFN	15	19	Analog input	Negative reference input
REFP	16	20	Analog input	Positive reference input
PDWN	22	26	Digital input	Power-down: hold this pin low to power down and reset the ADC. Toggle the pin at device power-up. See the Power-Up Sequence section for more information.

Table 5-1. Pin Functions (continued)

PIN			TYPE	DESCRIPTION
NAME	ADS1232	ADS1234		
SCLK	23	27	Digital input	Serial clock: clock out data on the rising edge. Also used to initiate offset calibration and standby modes. See the Offset Calibration Mode and Standby Mode With Offset-Calibration sections for more information.
SPEED	21	25	Digital input	Data rate select. See the Data Rate section for more information.
TEMP	7	—	Digital input	Temperature sensor select. See Table 8-1 for more information.
XTAL2	4	4	Digital	External crystal connection 2

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Power-supply voltage	AVDD to AGND	-0.3	6	V
	DVDD to DGND	-0.3	6	
	AGND to DGND	-0.3	0.3	
Analog input voltage	AINN _x , AINP _x , REFP, REFN	AGND - 0.3	AVDD + 0.3	V
Digital input voltage	A0, A1, CLKIN/XTAL1, XTAL2, $\overline{\text{DRDY}}$ /DOUT, GAIN0, GAIN1, PWDN, SCLK, SPEED	DGND - 0.3	DVDD + 0.3	V
Input current	Continuous, all pins except power-supply pins ⁽²⁾	-10	10	mA
Temperature	Junction, T _J		150	°C
	Storage, T _{stg}	-60	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input and output pins are diode-clamped to the internal power supplies. Limit the input current to 10 mA in the event the analog input voltage exceeds AVDD + 0.3 V or AGND - 0.3 V, or if the digital input voltage exceeds DVDD + 0.3 V or DGND - 0.3 V.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
POWER SUPPLY						
	Analog power supply	AVDD to AGND	2.7		5.3	V
	Digital power supply	DVDD to DGND	2.7		5.3	V
ANALOG INPUTS						
	Full-scale input voltage	$V_{(AINPx)} - V_{(AINNx)}$	$\pm 0.5 V_{REF} / \text{Gain}$			V
	Common-mode input range	Gain = 1 and 2	AGND – 0.1		AVDD + 0.1	V
		Gain = 64 and 128	AGND + 1.5		AVDD – 1.5	
VOLTAGE REFERENCE INPUTS						
V_{REF}	Voltage reference input	$V_{REF} = V_{(REFP)} - V_{(REFN)}$	1.5	AVDD	AVDD + 0.1	V
$V_{(REFN)}$	Negative reference input		AGND – 0.1		$V_{(REFP)} - 1.5$	V
$V_{(REFP)}$	Positive reference input		$V_{(REFN)} + 1.5$		AVDD + 0.1	V
EXTERNAL CLOCK INPUT						
f_{CLK}	External clock frequency		0.2	4.9152	8	MHz
SERIAL INTERFACE CLOCK INPUT						
$f_{(SCLK)}$	Serial clock frequency				5	MHz
DIGITAL INPUTS						
	Input voltage		DGND		DVDD + 0.1	V
TEMPERATURE						
T_A	Operating ambient temperature		–40		105	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS1232	ADS1234	UNIT
		PW (TSSOP)	PW (TSSOP)	
		24 PINS	28 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	82.4	74.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	25.5	21.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	38.1	32.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.3	1.1	°C/W
ψ_{JB}	Junction-to-board characterization parameter	37.6	32.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

6.5 Electrical Characteristics

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+105^\circ\text{C}$; typical specifications are at $T_A = 25^\circ\text{C}$; all specifications are at $AVDD = DVDD = V_{(REFP)} = 5\text{ V}$, $V_{(REFN)} = \text{AGND}$, and $f_{\text{CLK}} = 4.9152\text{ MHz}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUTS						
	Differential input current	Gain = 1	±3		nA	
		Gain = 2	±6			
		Gain = 64, 128	±3.5			
SYSTEM PERFORMANCE						
	Resolution	No missing codes	24			Bits
f_{DATA}	Data rate	Internal oscillator, SPEED = high	78	80	82.4	SPS
		Internal oscillator, SPEED = low	9.75	10	10.3	
		External oscillator, SPEED = high	$f_{\text{CLK}} / 61,440$			
		External oscillator, SPEED = low	$f_{\text{CLK}} / 491,520$			
	Digital filter settling time	Full settling, readings synchronized with A0, A1 pins	4			Conversions
INL	Integral nonlinearity	Differential input, end-point fit, gain = 1, 2	-0.001	±0.0002	0.001	% of FSR ⁽¹⁾
		Differential input, end-point fit, gain = 64, 128	±0.0004			
	Input offset error ⁽²⁾	Gain = 1	-5	±0.2	5	ppm of FS
		Gain = 128	-1	±0.02	1	
	Input offset drift	Gain = 1	±0.3		μV/°C	
		Gain = 128	±10		nV/°C	
	Gain error ⁽³⁾	Gain = 1	-0.02	±0.001	0.02	%
		Gain = 128	-0.1	±0.01	0.1	
	Gain drift	Gain = 1	±0.2		ppm/°C	
		Gain = 128	±2.5			
NMRR	Normal-mode rejection ratio ⁽⁴⁾	Internal oscillator, $f_{\text{DATA}} = 10\text{ SPS}$ $f_{\text{IN}} = 50\text{ Hz or }60\text{ Hz, } \pm 1\text{ Hz}$	100	110		dB
		External oscillator, $f_{\text{DATA}} = 10\text{ SPS}$ $f_{\text{IN}} = 50\text{ Hz or }60\text{ Hz, } \pm 1\text{ Hz}$	120	130		
CMRR	Common-mode rejection ratio	At DC, gain = 1, $\Delta V = 1\text{ V}$, $V_{\text{CM}} = AVDD / 2$	95	110		dB
		At DC, gain = 128, $\Delta V = 0.1\text{ V}$, $V_{\text{CM}} = AVDD / 2$	95	110		
e_n	Input-referred noise	See the Noise Performance section				
PSRR	Power-supply rejection	AVDD, at DC, gain = 1, $\Delta V = 1\text{ V}$	85		dB	
		AVDD, at DC, gain = 128, $\Delta V = 0.1\text{ V}$	100	120		
VOLTAGE REFERENCE INPUT						
	Input current		10			nA
DIGITAL LOGIC LEVELS						
V_{IH}	High-level input voltage		0.7 DVDD			V
V_{IL}	Low-level input voltage				0.2 DVDD	V
V_{OH}	High-level output voltage	$I_{\text{OH}} = 1\text{ mA}$	DVDD - 0.4			V
V_{OL}	Low-level output voltage	$I_{\text{OL}} = 1\text{ mA}$			0.2 DVDD	V
	Input leakage current	$0\text{ V} < V_{\text{IN}} < DVDD$	-10		10	μA

6.5 Electrical Characteristics (continued)

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+105^\circ\text{C}$; typical specifications are at $T_A = 25^\circ\text{C}$; all specifications are at $AVDD = DVDD = V_{(REFP)} = 5\text{ V}$, $V_{(REFN)} = \text{AGND}$, and $f_{\text{CLK}} = 4.9152\text{ MHz}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
$I_{(AVDD)}$	Analog supply current	Normal mode, AVDD = 3 V, gain = 1, 2		600	1300	μA
		Normal mode, AVDD = 3 V, gain = 64, 128		1350	2500	
		Normal mode, AVDD = 5 V, gain = 1, 2		650	1300	
		Normal mode, AVDD = 5 V, gain = 64, 128		1350	2500

		Normal mode, AVDD = DVDD = 5 V, gain = 1, 2		3.7	7.2	
		Normal mode, AVDD = DVDD = 3 V, gain = 64, 128		4.3	7.9	
		Normal mode, AVDD = DVDD = 5 V, gain = 64, 128		7.1	13.1	
		Standby mode, AVDD = DVDD = 5 V		0.3	0.4	

- (1) FSR = full-scale range = $V_{\text{REF}} / \text{Gain}$.
- (2) Input offset error specified after calibration. Recalibration minimizes these errors to the level of noise at any temperature.
- (3) Gain errors are calibrated at the factory ($AVDD = 5\text{ V}$, all gains, $T_A = 25^\circ\text{C}$).
- (4) Specification is assured by the combination of design and final production test.

6.6 Typical Characteristics

at $T_A = 25^\circ\text{C}$, $AVDD = DVDD = V_{(REFP)} = 5\text{ V}$, and $V_{(REFN)} = \text{AGND}$ (unless otherwise noted)

7 Parameter Measurement Information

7.1 Noise Performance

The ADS123x offer outstanding noise performance that can be optimized for a given full-scale range using the programmable gain amplifier (PGA). Table 7-1 through Table 7-4 summarize the typical noise performance with inputs shorted externally for different gains, data rates, and voltage reference values. The RMS and peak-to-peak noise data are referred to the input.

The effective resolution of the ADC is defined as:

$$\text{Effective Resolution (Bits)} = \ln(\text{FSR} / \text{RMS Noise}) / \ln(2) \quad (1)$$

The noise-free resolution of the ADC is defined as:

$$\text{Noise-Free Resolution (Bits)} = \ln(\text{FSR} / \text{Peak-to-Peak Noise}) / \ln(2) \quad (2)$$

where

- FSR = full-scale range = $V_{\text{REF}} / \text{gain}$

Table 7-1. AVDD = 5 V, V_{REF} = 5 V, Data Rate = 10 SPS

GAIN	RMS NOISE	PEAK-TO-PEAK NOISE ⁽¹⁾	EFFECTIVE RESOLUTION (Bits)	NOISE-FREE RESOLUTION (Bits)
1	420 nV	1.79 μV	23.5	21.4
2	270 nV	900 nV	23.1	21.4
64	19 nV	125 nV	22.0	19.2
128	17 nV	110 nV	21.1	18.4

(1) Peak-to-peak noise data are based on direct measurement.

Table 7-2. AVDD = 5 V, V_{REF} = 5 V, Data Rate = 80 SPS

GAIN	RMS NOISE	PEAK-TO-PEAK NOISE ⁽¹⁾	EFFECTIVE RESOLUTION (Bits)	NOISE-FREE RESOLUTION (Bits)
1	1.36 μV	8.3 μV	21.8	19.2
2	850 nV	5.5 μV	21.5	18.8
64	48 nV	307 nV	20.6	18
128	44 nV	247 nV	19.7	17.2

(1) Peak-to-peak noise data are based on direct measurement.

Table 7-3. AVDD = 3 V, V_{REF} = 3 V, Data Rate = 10 SPS

GAIN	RMS NOISE	PEAK-TO-PEAK NOISE ⁽¹⁾	EFFECTIVE RESOLUTION (Bits)	NOISE-FREE RESOLUTION (Bits)
1	450 nV	2.8 μV	22.6	20
2	325 nV	1.8 μV	22.1	19.7
64	20 nV	130 nV	21.2	18.5
128	18 nV	115 nV	20.3	17.6

(1) Peak-to-peak noise data are based on direct measurement.

Table 7-4. AVDD = 3 V, V_{REF} = 3 V, Data Rate = 80 SPS

GAIN	RMS NOISE	PEAK-TO-PEAK NOISE ⁽¹⁾	EFFECTIVE RESOLUTION (Bits)	NOISE-FREE RESOLUTION (Bits)
1	2.2 μV	12 μV	20.4	17.9
2	1.2 μV	6.8 μV	20.2	17.8
64	54 nV	340 nV	19.7	17.1
128	48 nV	254 nV	18.9	16.5

(1) Peak-to-peak noise data are based on direct measurement of 1024 samples.

8 Detailed Description

8.1 Overview

The ADS1232 and ADS1234 (ADS123x) are highly integrated, 24-bit ADCs that include an input multiplexer, low-noise PGA, third-order delta-sigma ($\Delta\Sigma$) modulator, and fourth-order digital filter. With input-referred RMS noise down to 17 nV, the ADS123x are ideally suited for measuring the very low signals produced by bridge sensors in applications such as weigh scales, strain gauges, and pressure sensors.

Clocking can be supplied by an external oscillator, an external crystal, or by a precision internal oscillator. Data can be output at 10 SPS for excellent 50-Hz and 60-Hz rejection, or at 80 SPS when higher speeds are needed. The ADS123x are easy to configure, and all digital control is accomplished through dedicated pins; there are no registers to program. A simple two-wire serial interface retrieves the data.

8.2 Functional Block Diagram

NOTE: (1) A1 for ADS1234, TEMP for ADS1232.

8.3 Feature Description

8.3.1 Analog Inputs (AINPx, AINNx)

The input signal to be measured is applied to the input pins AINPx and AINNx. The positive internal input is generalized as AINP, and the negative internal input generalized as AINN. The signal is selected through the input MUX, which is controlled by pins A0 and TEMP (ADS1232) and pins A0 and A1 (ADS1234), as shown in [Table 8-1](#) and [Table 8-2](#).

The ADS123x accept differential input signals, but can also accept single-ended signals. When measuring single-ended signals, it is permissible to connect the negative input (AINNx) to ground only for gain = 1 or 2. When using gain = 64 or 128, connect AINNx to a level-shift voltage equal to mid-AVDD supply to comply with the input range requirement. Connect the signal to the positive input (AINPx). When the ADS123x are configured this way, only half of the converter full-scale range is used because only positive digital output codes are produced.

The analog and reference inputs are protected by ESD diodes. See [Figure 8-3](#) for the similar connection of the ESD diodes for the analog inputs.

Table 8-1. ADS1232 Input Channel Selection With A0 and TEMP

MUX PINS		SELECTED ANALOG INPUTS	
TEMP	A0	POSITIVE INPUT	NEGATIVE INPUT
0	0	AINP1	AINN1
0	1	AINP2	AINN2
1	x	Temperature sensor	Temperature sensor

Table 8-2. ADS1234 Input Channel Selection With A0 and A1

MUX PINS		SELECTED ANALOG INPUTS	
A1	A0	POSITIVE INPUT	NEGATIVE INPUT
0	0	AINP1	AINN1
0	1	AINP2	AINN2
1	0	AINP3	AINN3
1	1	AINP4	AINN3

8.3.2 Temperature Sensor (ADS1232 Only)

On-chip diodes provide temperature-sensing capability. By setting the TEMP pin high, the selected analog inputs are disconnected and the inputs to the ADC are connected to the anodes of two diodes scaled to 1x and 80x in current and size, as shown in Figure 8-1. By measuring the difference in voltage of these diodes, temperature changes can be inferred from a baseline temperature. Typically, the difference in diode voltage is 111.7 mV at 25°C with a temperature coefficient of 379 $\mu\text{V}/^\circ\text{C}$. With PGA gain = 1 and 2, the difference voltage output from the PGA is 111.7 mV and 223.4 mV, respectively. The temperature sensor function is impossible to use with PGA gain = 64 and 128.

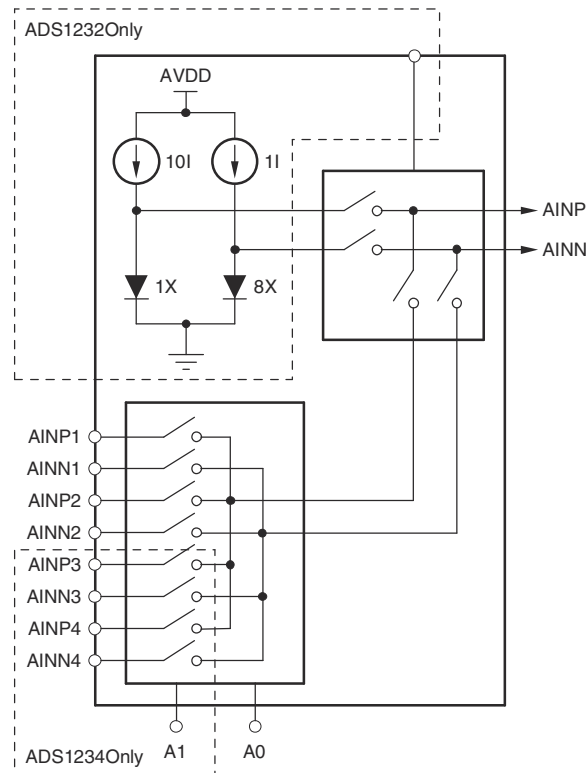

Figure 8-1. Measurement of the Temperature Sensor in the Input Multiplexer

8.3.3 Low-Noise PGA

The ADS123x feature a low-drift, low-noise PGA that provides a complete front-end solution for bridge sensors. A simplified diagram of the PGA is shown in Figure 8-2. The PGA consists of two chopper-stabilized amplifiers (A1 and A2) and three accurately matched resistors (R_1 , R_{F1} , and R_{F2}), which construct a differential front-end stage with a gain of 64, followed by gain stage A3. The PGA inputs are equipped with an EMI filter, as shown in Figure 8-2. The cut-off frequency of the EMI filter is 19.6 MHz. If the PGA gain is set to 1 or 2, the gain-of-64 stage is bypassed and shut down to save power. With the combination of both gain stages, the PGA gain can be set to 64 or 128. The PGA gain of the ADS123x is set to 1, 2, 64, or 128 by pins GAIN1 (MSB) and GAIN0 (LSB). Table 8-3 shows the gain setting of the PGA.

Table 8-3. PGA Gain

GAIN[1:0] INPUT PINS	PGA GAIN
00	1
01	2
10	64
11	128

By using AVDD as the reference input, the bipolar input ranges from ± 2.5 V to ± 19.5 mV, while the unipolar ranges from 2.5 V to 19.5 mV. When the PGA gain is set to 1 or 2, the absolute inputs can go rail-to-rail without significant performance degradation. However, the inputs of the ADS123x are protected with internal diodes connected to the power-supply rails. These diodes clamp the applied signal to prevent damage to the input circuitry. On the other hand, when the PGA gain is set to 64 or 128, the operating input range is limited to (AGND + 1.5 V) to (AVDD – 1.5 V), in order to prevent saturating the differential front-end circuitry and degrading performance.

Figure 8-2. Simplified Diagram of the PGA

8.3.3.1 PGA Bypass Capacitor

By applying a 0.1- μ F external capacitor (C_{EXT}) across two PGA output pins (pins 9 and 10) and the combination of the internal 2-k Ω resistor (R_{INT}), a low-pass filter, with a corner frequency of 720 Hz, is created to band limit the signal path prior to the modulator input. This low-pass filter serves two purposes. First, the input signal is band-limited to prevent aliasing, as well as to filter high-frequency noise. Second, the low-pass filter attenuates the chopping residue from the PGA (for gains of 64 and 128 only) to improve temperature drift performance. High-quality capacitors (such as high-k ceramic or tantalum capacitors) are not required for a general application. However, high-quality capacitors, such as COG dielectric ceramic or poly, are recommended for high-linearity applications.

8.3.4 Voltage Reference Inputs (REFP, REFN)

The voltage reference used by the modulator is generated from the voltage difference between pins REFP and REFN: $V_{REF} = V_{(REFP)} - V_{(REFN)}$. The reference inputs use a structure similar to that of the analog inputs. In order to increase the reference input impedance, a switching buffer circuitry is used to reduce the input equivalent capacitance. The reference drift and noise impact ADC performance. In order to achieve best results, pay close attention to the reference noise and drift specifications. A simplified diagram of the circuitry on the reference inputs is shown in Figure 8-3. The switches and capacitors can be modeled with an effective impedance of:

$$Z_{EFF} = \frac{1}{2f_{MOD}C_{BUF}}$$

where

- f_{MOD} = modulator sampling frequency = $f_{CLK} / 64 = (76.8 \text{ kHz})$
- C_{BUF} = input capacitance of the buffer

For the ADS123x:

$$Z_{EFF} = \frac{1}{(2)(76.8\text{kHz})(13\text{fF})} = 500\text{M}\Omega$$

Figure 8-3. Simplified Reference Input Circuitry

ESD diodes protect the reference inputs. To prevent these diodes from turning on, make sure the voltages on the reference pins do not go below AGND by more than 100 mV; and likewise, do not exceed AVDD by 100 mV:

$$AGND - 100 \text{ mV} < V_{(REFP)} \text{ or } V_{(REFN)} < AVDD + 100 \text{ mV}$$

8.3.5 Clock Sources

The ADS123x can use an external clock source, external crystal, or internal oscillator to accommodate a wide variety of applications. Figure 8-4 shows the equivalent circuitry of the clock source. The CLK_DETECT block determines whether a crystal oscillator or external clock signal is applied to the CLKIN/XTAL1 pin so that the internal oscillator is bypassed or activated. When the CLKIN/XTAL1 pin frequency is above approximately 200 kHz, the CLK_DETECT output goes low and shuts down the internal oscillator. When the CLKIN/XTAL1 pin frequency is below approximately 200 kHz, the CLK_DETECT output goes high and activates the internal oscillator. Connect the CLKIN/XTAL1 pin to ground when the internal oscillator is chosen.

Figure 8-4. Equivalent Circuitry of the Clock Source

For crystal operation, connect the 4.9152-MHz crystal across the CLKIN/XTAL1 and XTAL2 pins. Table 8-4 shows the recommended crystal part numbers. As a result of the low-power design of the internal parallel-resonant circuit, both the CLKIN/XTAL1 and XTAL2 pins are only for use with the external crystal; do not use these pins as clock output drivers for external circuitry. No external capacitors are used with the crystal. Place the crystal as close as possible to the device pins in order to reduce board stray capacitance and in order to help ensure proper crystal operation.

Table 8-4. Recommended Crystals

MANUFACTURER	FREQUENCY	PART NUMBER
ECS	4.9152 MHz	ECS-49-20-1
ECS	4.9152 MHz	ECS-49-20-4

An external clock oscillator can be used by driving the CLKIN/XTAL1 pin from the oscillator output and leave XTAL2 disconnected.

8.3.6 Digital Filter Frequency Response

The ADS123x use a sinc⁴ digital filter with the frequency response ($f_{CLK} = 4.9152$ MHz) shown in Figure 8-5. The frequency response repeats at multiples of the modulator sampling frequency of 76.8 kHz. The overall response is that of a low-pass filter with a -3-dB cutoff frequency of 2.4 Hz with the SPEED pin tied low (10-SPS data rate) and 19 Hz with the SPEED pin tied high (80-SPS data rate).

Figure 8-5. Digital Filter Frequency Response

To better demonstrate the response at lower frequencies, Figure 8-6(a) illustrates the response out to 100 Hz, when the data rate = 10 SPS. Notice that signals at multiples of 10 Hz are rejected, and therefore, simultaneous rejection of 50 Hz and 60 Hz interference is achieved.

The benefit of using a sinc⁴ filter is that every frequency notch has four zeros at the same location. This response, combined with the low-drift internal oscillator, provides an excellent normal-mode rejection of line-cycle interference.

Figure 8-6(b) shows the plot enlarged for both 50-Hz and 60-Hz notches with the SPEED pin tied low (10-SPS data rate). With only a $\pm 3\%$ variation of the internal oscillator, over 100 dB of normal-mode rejection is achieved.

Figure 8-6. Digital Filter Frequency Response to 100 Hz

The ADS123x data rate and frequency response scale directly with clock frequency. For example, if f_{CLK} increases from 4.9152 MHz to 6.144 MHz when the SPEED pin is tied high, the data rate increases from 80 SPS to 100 SPS, while filter notches also increase from 80 Hz to 100 Hz. Frequency scaling is only possible when the external clock source is applied.

8.3.7 Settling Time

After changing the input multiplexer, the first data are fully settled. In both ADS123x devices, the digital filter is allowed to settle after toggling either the A1 or A0 pin. Toggling any of these digital pins holds the $\overline{\text{DRDY}}/\text{DOUT}$ line high until the digital filter is fully settled. For example, if A0 changes from low to high, selecting a different input channel, $\overline{\text{DRDY}}/\text{DOUT}$ immediately goes high, and $\overline{\text{DRDY}}/\text{DOUT}$ goes low when fully settled data are ready for retrieval. There is no need to discard any data. Figure 8-7 shows the timing of the $\overline{\text{DRDY}}/\text{DOUT}$ line as the input multiplexer changes.

In certain instances, large or abrupt input changes require four data cycles to settle. One example of such a change is an external multiplexer in front of the ADS123x, which can cause large changes in input voltage simply by switching input channels. Another example is toggling the TEMP pin, which switches the internal AINP, AINN signals to connect to either the external AINPx, AINNx pins or to the TEMP diode (see Figure 8-1).

To acquire fully settled data after an input step change, five readings are required. Five readings are required because if the change in input occurs in the middle of the first conversion, four additional full conversions of the fully settled input are required to get fully settled data. Discard the first four readings because they contain only partially settled data. Figure 8-8 illustrates the settling time for the ADS123x in continuous conversion mode.

Figure 8-7. Example of Settling Time After Changing the Input Multiplexer

Table 8-5. Timing Requirements for Figure 8-7

PARAMETER ⁽¹⁾		MIN	MAX	UNIT
t_s	Setup time for changing the A1 or A0 pins	40	50	μs
t_1	Settling time ($\overline{\text{DRDY}}/\text{DOUT}$ held high)	SPEED = 1	51	ms
		SPEED = 0	401	ms

(1) Values given for $f_{\text{CLK}} = 4.9152 \text{ MHz}$. For different f_{CLK} frequencies, scale proportional to CLK period. Expect a $\pm 3\%$ variation when an internal oscillator is used.

Figure 8-8. Settling Time in Continuous Conversion Mode

8.3.8 Data Rate

The ADS123x data rate is set by the SPEED pin, as shown in Table 8-6. When SPEED is low, the data rate is nominally 10 SPS. This data rate provides the lowest noise, and also has excellent rejection of both 50-Hz and 60-Hz line-cycle interference. For applications requiring fast data rates, setting SPEED high selects a data rate of 80 SPS.

Table 8-6. Data Rate Settings

SPEED PIN	DATA RATE	
	INTERNAL OSCILLATOR OR 4.9152-MHz CRYSTAL	EXTERNAL OSCILLATOR
0	10 SPS	$f_{\text{CLK}} / 491,520$
1	80 SPS	$f_{\text{CLK}} / 61,440$

8.3.9 Data Format

The ADS123x output 24 bits of data in binary two's complement format. The least significant bit (LSB) has a weight of $0.5 V_{\text{REF}} / (2^{23} - 1)$. The positive full-scale input produces an output code of 7FFFFFFh and the negative full-scale input produces an output code of 800000h. The output clips at these codes for signals exceeding full-scale. Table 8-7 summarizes the ideal output codes for different input signals.

Table 8-7. Ideal Output Code Versus Input Signal ⁽¹⁾

INPUT SIGNAL V_{IN} (AINP – AINN)	IDEAL OUTPUT CODE
$\geq 0.5 V_{\text{REF}} / \text{Gain}$	7FFFFFFh
$(0.5 V_{\text{REF}} / \text{Gain}) / (2^{23} - 1)$	000001h
0	000000h
$(-0.5 V_{\text{REF}} / \text{Gain}) / (2^{23} - 1)$	FFFFFFh
$\leq -0.5 V_{\text{REF}} / \text{Gain}$	800000h

(1) Excludes effects of noise, INL, offset, and gain errors.

8.3.10 Data Ready and Data Output ($\overline{\text{DRDY}}$ /DOUT)

This digital output pin serves two purposes. First, $\overline{\text{DRDY}}$ /DOUT indicates when new data are ready by going low. Afterwards, on the first rising edge of SCLK, the $\overline{\text{DRDY}}$ /DOUT pin changes function and begins outputting the conversion data, most significant bit (MSB) first. Data are shifted out on each subsequent SCLK rising edge. After all 24 bits have been retrieved, the pin can be forced high with an additional SCLK. $\overline{\text{DRDY}}$ /DOUT then remains high until new data are ready. This configuration is useful when polling on the status of $\overline{\text{DRDY}}$ /DOUT to determine when to begin data retrieval.

8.3.11 Serial Clock Input (SCLK)

This digital input shifts serial data out with each rising edge. This input has built-in hysteresis, but care must be taken to ensure a clean signal. Glitches or slow-rising signals can cause unwanted additional shifting. For this reason, make sure the rise-and-fall times of SCLK are less than 50 ns.

8.3.12 Data Retrieval

The ADS123x continuously converts the analog input signal. To retrieve data, wait until $\overline{\text{DRDY}}/\text{DOUT}$ goes low, as shown in Figure 8-9. After $\overline{\text{DRDY}}/\text{DOUT}$ goes low, begin shifting out the data by applying SCLKs. Data are shifted out MSB first. Not all 24 bits of data are required to be shifted out, but the data must be retrieved before new data are updated (within t_7) or else the data are overwritten. Avoid data retrieval during the update period (t_6). $\overline{\text{DRDY}}/\text{DOUT}$ remains at the state of the last bit shifted out until taken high (see t_6), indicating that new data are being updated. To avoid having $\overline{\text{DRDY}}/\text{DOUT}$ remain in the state of the last bit, the user can shift SCLK to force $\overline{\text{DRDY}}/\text{DOUT}$ high, as shown in Figure 8-10. This technique is useful when a host controlling the device is polling $\overline{\text{DRDY}}/\text{DOUT}$ to determine when data are ready.

Figure 8-9. Data Retrieval Timing

Table 8-8. Timing Requirements for Figure 8-9

PARAMETER		MIN	TYP	MAX	UNIT
t_2	$\overline{\text{DRDY}}/\text{DOUT}$ low to first SCLK rising edge	0			ns
t_3	SCLK positive or negative pulse width	100			ns
t_4	SCLK rising edge to new data bit valid: propagation delay			50	ns
t_5	SCLK rising edge to old data bit valid: hold time	0			ns
t_6 (1)	Data updating: no readback allowed	39			μs
t_7 (1)	Conversion time (1/data rate)	SPEED = 1			ms
		SPEED = 0			

(1) Values given for $f_{\text{CLK}} = 4.9152 \text{ MHz}$. For different f_{CLK} frequencies, scale proportional to the CLK period.

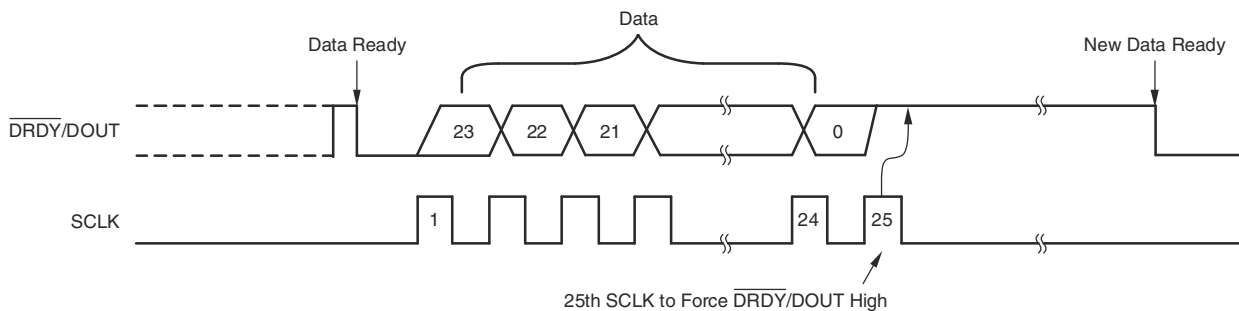

Figure 8-10. Data Retrieval With $\overline{\text{DRDY}}/\text{DOUT}$ Forced High Afterwards

8.4 Device Functional Modes

In addition to the active conversion mode, the device has other functional modes: offset calibration mode (to calibrate the ADC internal offset), standby mode (saving power when not converting), and a power-down mode (for complete device shutdown).

8.4.1 Offset Calibration Mode

Offset calibration can be initiated at any time to remove the ADS123x offset error. To initiate offset calibration, apply at least two additional SCLKs after retrieving 24 bits of data. Figure 8-11 shows the timing pattern. The 25th SCLK sends $\overline{\text{DRDY}}/\text{DOUT}$ high. The falling edge of the 26th SCLK begins the calibration cycle. Additional SCLK pulses can be sent after the 26th SCLK; however, minimize activity on SCLK during offset calibration for best results. The analog input pins are disconnected within the ADC and the appropriate signal is applied internally to perform the calibration.

When the calibration is completed, $\overline{\text{DRDY}}/\text{DOUT}$ goes low, indicating that new data are ready. The first conversion after a calibration is fully settled and valid for use. The offset calibration takes exactly the same time as specified in (t_g) right after the falling edge of the 26th SCLK.

Figure 8-11. Offset-Calibration Timing

Table 8-9. Timing Requirements for Figure 8-11

PARAMETER		MIN	MAX	UNIT
t_g (1)	First data ready after calibration	SPEED = 1 (80 SPS)	101.28	101.29
		SPEED = 0 (10 SPS)	801.02	801.03

(1) Values given for $f_{\text{CLK}} = 4.9152$ MHz. For different f_{CLK} frequencies, scale proportional to the CLK period. Expect a $\pm 3\%$ variation when the internal oscillator is used.

8.4.2 Standby Mode

Standby mode dramatically reduces power consumption by shutting down most of the circuitry. In standby mode, the entire analog circuitry is powered down and only the clock source circuitry is awake to reduce the wake-up time from the standby mode. To enter standby mode, simply hold SCLK high after $\overline{\text{DRDY}}/\text{DOUT}$ goes low; see Figure 8-12. Standby mode can be initiated at any time during readback; all 24 bits of data are not required to be retrieved beforehand.

When t_{10} has passed with SCLK held high, standby mode activates. $\overline{\text{DRDY}}/\text{DOUT}$ stays high when standby mode begins. SCLK must remain high to stay in standby mode. To exit standby mode (wakeup), set SCLK low. The first data after exiting standby mode is valid.

Figure 8-12. Standby Mode Timing (Can be Used for Single Conversions)

Table 8-10. Timing Requirements for Figure 8-12

PARAMETER			MIN	MAX	UNIT
t_9 (1)	SCLK high after $\overline{\text{DRDY}}/\text{DOUT}$ goes low to activate standby mode	SPEED = 1	0	12.44	ms
		SPEED = 0	0	99.94	
t_{10} (1)	Standby mode activation time	SPEED = 1	12.46		ms
		SPEED = 0	99.96		
t_{11} (1)	Data ready after exiting standby mode	SPEED = 1	52.51	52.51	ms
		SPEED = 0	401.8	401.8	

(1) Values given for $f_{\text{CLK}} = 4.9152$ MHz. For different f_{CLK} frequencies, scale proportional to the CLK period. Expect a $\pm 3\%$ variation when an internal oscillator is used.

8.4.3 Standby Mode With Offset-Calibration

Offset-calibration can be set to run immediately after exiting standby mode. This feature is useful when the ADS123x is put in standby mode for long periods of time, and offset-calibration is desired afterwards to compensate for temperature or supply voltage changes.

To force an offset-calibration with standby mode, shift 25 SCLKs and take the SCLK pin high to enter standby mode. Offset-calibration then begins after wake-up; Figure 8-13 shows the appropriate timing. Note the extra time needed after wake-up for calibration before data are ready. The first data after standby mode with offset-calibration is fully settled and can be used right away.

Figure 8-13. Standby Mode With Offset-Calibration Timing (Can be Used for Single Conversions)

Table 8-11. Timing Requirements for Figure 8-13

PARAMETER			MIN	MAX	UNIT
t_{12} (1)	Data ready after exiting standby mode and calibration	SPEED = 1	103	103	ms
		SPEED = 0	803	803	

(1) Values given for $f_{\text{CLK}} = 4.9152$ MHz. For different f_{CLK} frequencies, scale proportional to CLK period. Expect a $\pm 3\%$ variation when an internal oscillator is used.

8.4.4 Power-Down Mode

Power-down mode shuts down the entire ADC circuitry and reduces the total power consumption close to zero. To enter power-down mode, hold the $\overline{\text{P}}\text{WDN}$ pin low. Power-down mode also resets the entire circuitry to free the ADC circuitry from locking up to an unknown state. Power-down mode can be initiated at any time during readback; not all 24 bits of data must be retrieved beforehand. Figure 8-14 shows the wake-up timing from power-down mode.

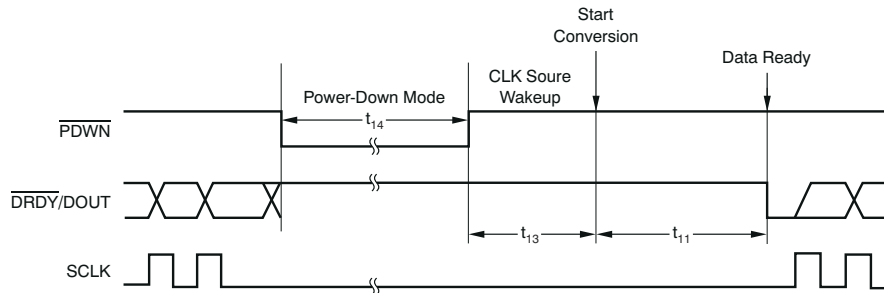

Figure 8-14. Wake-Up Timing From Power-Down Mode

Table 8-12. Timing Requirements for Figure 8-14

PARAMETER		MIN	TYP	UNIT
t ₁₃	Wake-up time after power-down mode	Internal clock	7.95	μs
		External clock	0.16	μs
		Crystal oscillator ⁽¹⁾	5.6	ms
t ₁₄ ⁽²⁾	$\overline{\text{P}}\text{WDN}$ pulse duration	26		μs

(1) No capacitors on CLKIN/XTAL1 or XTAL2 outputs.

(2) Value given for $f_{\text{CLK}} = 4.9152$ MHz. For different f_{CLK} frequencies, the scale is proportional to the CLK period except for a $\pm 3\%$ variation when an internal oscillator is used.

8.4.5 Power-Up Sequence

When powering up the ADS123x, follow the prescribed $\overline{\text{P}}\text{WDN}$ pin sequence as shown in Figure 8-15. At power-up, hold the $\overline{\text{P}}\text{WDN}$ pin low until after AVDD and DVDD have stabilized above the minimum specified voltage levels. After an initial delay where $\overline{\text{P}}\text{WDN}$ must be held low (t_{15}), take $\overline{\text{P}}\text{WDN}$ high then toggle $\overline{\text{P}}\text{WDN}$ low to high with pulse durations (t_{16} and t_{17}) as shown in Figure 8-15 and Table 8-13. The ADC then begins operation as shown in Figure 8-14 and Table 8-12. Control $\overline{\text{P}}\text{WDN}$ by the host processor to provide the required power-on timing.

Figure 8-15. Power-Up Timing Sequence

Table 8-13. Power-up Timing Requirements for Figure 8-15

PARAMETER		MIN ⁽¹⁾	UNIT
t ₁₅	Delay time, $\overline{\text{P}}\text{WDN}$ high after AVDD, DVDD stable	10	μs
t ₁₆	Pulse duration, $\overline{\text{P}}\text{WDN}$ high	26	μs
t ₁₇	Pulse duration, $\overline{\text{P}}\text{WDN}$ low	26	μs

(1) $f_{\text{CLK}} = 4.9152$ MHz. For $f_{\text{CLK}} < 4.9152$ MHz, adjust the $\overline{\text{P}}\text{WDN}$ delay time and pulse duration accordingly.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The ADS123x devices are high-resolution, 24-bit ADCs with an integrated low-noise PGA. Best performance is achieved by following the guidelines and recommendations described in the [Typical Application](#) section.

9.2 Typical Application

Figure 9-1 shows a circuit diagram of the ADS1232 as part of a weigh scale system. In this setup, the ADS1232 is configured to channel 1 input, gain = 128, and 10 SPS data rate. Gain = 128 is selected by tying the GAIN[1:0] pins to logic high (3 V in this example). Input channel 1 and data rate = 10 SPS are selected by tying input channel select pins A0 and TEMP to ground, and by tying the data rate select pin SPEED to ground. The unused channel 2 inputs are tied to ground.

The internal oscillator is selected by grounding the CLKIN/XTAL1 pin. The other clock options are 1) 4.9152-MHz crystal across the CLKIN/XTAL1 and XTAL2 pins, or 2) apply a clock to the CLKIN/XTAL1 pin (pin XTAL2 unconnected). The $\overline{\text{PWDN}}$ pin of the ADC is routed to the controller because this pin must be toggled after the ADC is powered. The bridge excitation voltage is connected to the ADC reference input pins (REFP, REFN). Not shown in Figure 9-1 are R-C input filters for the signal and reference inputs. If these filters are used, match the filter time constants to maintain cancellation of noise common to both signal and reference inputs.

Figure 9-1. Weigh-Scale Application

9.2.1 Design Requirements

Table 9-1 summarizes the design performance goals. Table 9-2 summarizes the system design parameters.

Table 9-1. Design Goals

DESIGN GOAL	VALUE
Noise-free resolution	80,000 counts / 130,000 counts (post averaging)
Sample rate	10 SPS
Input step settling time	500 ms / 900 ms (post averaging)
50-Hz and 60-Hz noise rejection	>100 dB

Table 9-2. Design Parameters

DESIGN PARAMETERS	DESIGN VALUE
Bridge resistance	1 k Ω
Bridge excitation voltage	5 V
Load cell sensitivity	2 mV/V
Bridge full-scale output	10 mV
ADC analog power supply	5 V
Host controller and ADC digital power supply	3 V

9.2.2 Detailed Design Procedure

Common performance metrics of a weigh scale are noise-free resolution (or counts) and offset and gain stability (drift) after calibrating the weigh scale. Table 7-1 to Table 7-4 illustrate ADC noise performance expressed as an input-referred quantity over gain, data rate, and analog supply voltage.

In this design example, the ADC analog supply voltage (5 V) is used as the bridge excitation voltage. 5-V excitation optimizes the bridge signal output compared to 3-V excitation and also has the benefit of optimizing the ADC conversion noise. Gain = 128 is selected because it also provides optimal noise performance. The front end circuitry of the ADC easily accommodates the 10-mV bridge output. In summary, the ADC configuration that yields the highest resolution while achieving the sample rate and settling time requirements is AVDD = 5 V, bridge excitation = 5 V, gain = 128, and sample rate = 10 SPS.

Signal-to-noise performance is improved by using a higher gauge-factor bridge (example 3 mV/V bridge), or by increasing the excitation voltage. If the excitation voltage > 5 V, a voltage divider is required to reduce the voltage at the ADC reference inputs.

Noise-free counts are improved by post averaging the data (for example, a moving-average filter performed in the microcontroller). A moving average filter reduces noise by a factor of \sqrt{N} , where N is the number of readings averaged. However, a moving average filter increases the input step settling time due to the latency caused by averaging.

The other key performance attributes are DC offset and gain drift, and 50-Hz and 60-Hz noise rejection. Figure 6-14 and Figure 6-16 illustrate the distributions of offset and gain drift performance. 50-Hz and 60-Hz noise rejection is described in Figure 8-6. The ADC provides over 100-dB rejection with $\pm 3\%$ variation of the ADC clock frequency.

9.2.3 Application Curves

To evaluate the ADC's noise performance, four fixed-value, 1-k Ω low-drift precision resistors are connected in a bridge arrangement to simulate a bridge sensor. The simulator provides the same thermal noise generated by a physical bridge. One of the four bridge resistors is modified to 1.008 k Ω in order to provide a 10-mV output signal. The 10-mV signal is typical of a 2-mV/V load cell using 5-V excitation.

Figure 9-2 shows the ADC performance with data taken over a 60-second period. The 60-second period reveals true ADC peak-to-peak noise performance. Figure 9-3 shows the same conversion data processed by an external moving average filter (average x4). The noise-free resolution of the ADC is approximately 85,000 counts. Over the same 60-second period, the moving average filter improves noise-free resolution to 135,000 counts. The noise-free resolution (bits) corresponding to unfiltered and filtered data are 16.3 bits and 17.1 bits. See Equation 2 to calculate noise-free resolution in bits. In order to evaluate the actual noise-free resolution of the system, the 10-mV signal is used in the calculation, rather than the full input range of the ADC ($39\text{ mV} = V_{REF} / 128$),

As shown in the noise plots, the moving average filter reduces noise by approximately one-half. As a consequence of the post filter operation, the input step settling time increases from 500 ms to 900 ms (500 ms because of the ADC settling response time, 400 ms because of the post-averaging filter).

10 Power Supply Recommendations

At device power-on, follow the $\overline{\text{PWDN}}$ pin toggle sequence as detailed in the [Power-Up Sequence](#) section.

The ADC has an analog power supply (AVDD) and digital power supply (DVDD). The supply range is 2.7 V to 5.25 V. The analog and digital supplies can be tied together, however the digital power supply must be clean and free of glitches and transients, which can be generated by the operation of LEDs, relays, and so forth. The bridge excitation voltage is often the same as the ADC supply voltage, so it is important the supply voltage is free of transients.

Voltage ripple produced by switching power supplies can also degrade ADC performance. The use a low-dropout regulator (LDOs) can reduce voltage ripple caused by switching power supplies.

10.1 Power-Supply Decoupling

Good power-supply decoupling is important in order to achieve rated performance. The power supplies must be decoupled close to the power-supply pins using short, direct connections to ground. For both analog and digital power supplies, connect a 0.1- μF capacitor (X7R-dielectric ceramic) from the power-supply pins to the ground plane.

11 Layout

Good layout practices are crucial to realize the full-performance of the ADC. Poor grounding can quickly degrade the noise performance. The following layout guidelines help provide the best results.

11.1 Layout Guidelines

For best performance, dedicate a PCB layer to a ground plane and do not route any other signal traces on this layer. However, depending on space limitations, a dedicated ground plane may not be practical. If a continuous ground plane is not possible, connect the individual plane segments in one place at the ADC.

Route digital traces away from the PGA output pins (CAP) and away from all analog inputs and associated components in order to minimize interference. Maintain differential trace routing for the input signal and reference signal to minimize RFI susceptibility.

Use C0G capacitors for analog and reference input filters and the PGA output capacitor in high-linearity applications. High-K type capacitors (such as Y5V and X7R) should be avoided. Place supply bypass and the PGA bypass capacitors as close as possible to the device pins using short, direct traces. For optimum performance, use low-impedance connections (such as multiple vias) on the ground-side connections of the bypass capacitors.

Avoid long traces on $\overline{\text{DRDY}}/\text{DOUT}$, because high trace capacitance can lead to increased ADC noise. Use a series resistor or a local buffer if long traces are used. When applying an external clock, be sure the clock is free of overshoot and glitches. A source-termination resistor placed at the clock buffer helps control reflections and overshoot. Glitches present on the clock signal can lead to increased noise and possible mis-operation and must be avoided.

Figure 11-1 illustrates a PCB layout example. Separate 5-V analog and a 3.3-V digital supplies are shown. The ADC configuration is through hard-tie of the control pins as shown in Table 11-1.

Table 11-1. Layout Example Pin Connections

MODE	PIN CONTROL	VOLTAGE
Data rate = 10 SPS	SPEED	0 V
Gain = 128	GAIN[1:0]	3.3 V
Input = channel 1	A0, TEMP	0 V

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS1232IPW	ACTIVE	TSSOP	PW	24	60	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 105	ADS1232	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. MECHANICAL DATA

PW (R-PDSO-G28)

PLASTIC SMALL OUTLINE

4040064-7/G 02/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
 - E. Falls within JEDEC MO-153

PW (R-PDSO-G28)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate design.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
