## Control Integrated Power System

*Dual In-Line Intelligent Power Module*

*3Φ-bridge 600V / 6A*

### Features

- Fully isolated Dual In-Line molded module
- Infineon reverse conducting IGBTs with monolithic body diode
- Rugged SOI gate driver technology with stability against transient and negative voltage
- Allowable negative VS potential up to -11V for signal transmission at VBS=15V
- Integrated bootstrap functionality
- Over current shutdown
- Temperature monitor
- Under-voltage lockout at all channels
- Low side emitter pins accessible for all phase current monitoring (open emitter)
- Cross-conduction prevention
- All of 6 switches turn off during protection
- Lead-free terminal plating; RoHS compliant

### Target Applications

- Dish washers
- Refrigerators
- Fans
- Low power motor drives

### Description

The CIPOS™ module family offers the chance for integrating various power and control components to increase reliability, optimize PCB size and system costs.

It is designed to control three phase AC motors and permanent magnet motors in variable speed drives for applications like air conditioning, refrigerator and washing machine. The package concept is specially adapted to power applications, which need good thermal conduction and electrical isolation, but also EMI-save control and overload protection. The features of Infineon reverse conducting IGBT are combined with an optimized SOI gate driver for excellent electrical performance.

### System Configuration

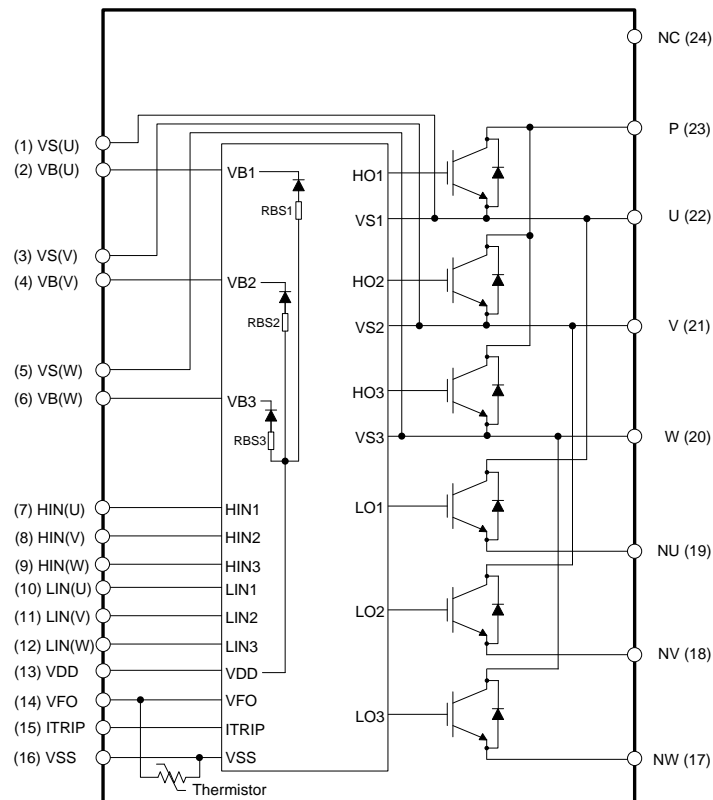

- 3 half bridges with reverse conducting IGBT
- 3Φ SOI gate driver
- Thermistor
- Pin-to-heasink creepage distance typ. 1.6mm

**Pin Description**

**HIN(U,V,W) and LIN(U,V,W) (Low side and high side control pins, Pin 7 - 12)**

These pins are positive logic and they are responsible for the control of the integrated IGBT. The Schmitt-trigger input threshold of them are such to guarantee LSTTL and CMOS compatibility down to 3.3V controller outputs. Pull-down resistor of about 5kΩ is internally provided to pre-bias inputs during supply start-up and a zener clamp is provided for pin protection purposes. Input schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time  $t_{FILIN}$ . The filter acts according to Figure 4.

**Figure 3: Input pin structure**

**Figure 4: Input filter timing diagram**

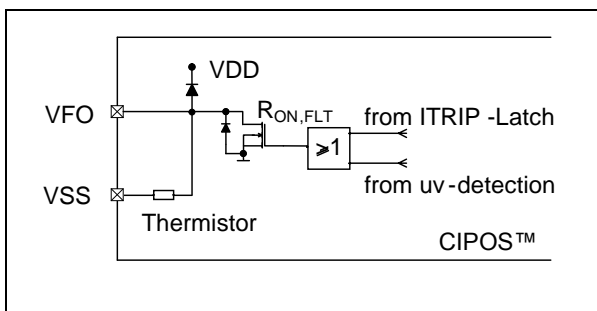

It is recommended for proper work of CIPOS™ not to provide input pulse-width lower than 1 $\mu$ s.

The integrated gate drive provides additionally a shoot through prevention capability which avoids the simultaneous on-state of two gate drivers of the same leg (i.e. HO1 and LO1, HO2 and LO2, HO3 and LO3). When two inputs of a same leg are activated, only former activated one is activated so that the leg is kept steadily in a safe state.

A minimum deadtime insertion of typ 380ns is also provided by driver IC, in order to reduce cross-conduction of the external power switches.

#### VFO (Fault-output and NTC, Pin 14)

The VFO pin indicates a module failure in case of under voltage at pin VDD or in case of triggered over current detection at ITRIP. A pull-up resistor is externally required to bias the NTC.

**Figure 5: Internal circuit at pin VFO**

The same pin provides direct access to the NTC, which is referenced to VSS. An external pull-up resistor connected to +5V ensures, that the resulting voltage can be directly connected to the microcontroller.

#### ITRIP (Over current detection function, Pin 15)

CIPOS™ provides an over current detection function by connecting the ITRIP input with the motor current feedback. The ITRIP comparator threshold (typ 0.47V) is referenced to VSS ground. A input noise filter (typ:  $t_{TRIPMIN} = 530ns$ ) prevents the driver to detect false over-current events.

Over current detection generates a shut down of all outputs of the gate driver after the shutdown propagation delay of typically 1000ns.

The fault-clear time is set to typical 65 $\mu$ s.

#### VDD, VSS (Low side control supply and reference, Pin 13, 16)

VDD is the low side supply and it provides power both to input logic and to low side output power stage. Input logic is referenced to VSS ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of  $V_{DDUV+} = 12.1V$  is present.

The IC shuts down all the gate drivers power outputs, when the VDD supply voltage is below  $V_{DDUV-} = 10.4V$ . This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

#### VB(U,V,W) and VS(U,V,W) (High side supplies, Pin 1, 2, 3, 4, 5, 6)

VB to VS is the high side supply voltage. The high side circuit can float with respect to VSS following the external high side power device emitter voltage.

Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The under-voltage detection operates with a rising supply threshold of typical  $V_{BSUV+} = 12.1V$  and a falling threshold of  $V_{DDUV-} = 10.4V$ .

VS(U,V,W) provide a high robustness against negative voltage in respect of VSS of -50V transiently. This ensures very stable designs even under rough conditions.

#### NU, NV, NW (Low side emitter, Pin 17, 18, 19)

The low side emitters are available for current measurements of each phase leg. It is recommended to keep the connection to pin VSS as short as possible in order to avoid unnecessary inductive voltage drops.

#### P (Positive bus input voltage, Pin 23)

The high side IGBT are connected to the bus voltage. It is recommended that the bus voltage does not exceed 400 V.

### Absolute Maximum Ratings
