## Features

- Core: Arm ${ }^{\circledR}$ 32-bit Cortex ${ }^{\circledR}$-M4 CPU with FPU, Adaptive real-time accelerator (ART Accelerator) allowing 0-wait state execution from Flash memory, frequency up to 180 MHz , MPU, 225 DMIPS/1.25 DMIPS/MHz
(Dhrystone 2.1), and DSP instructions
- Memories
- 512 Kbytes of Flash memory
- 128 Kbytes of SRAM
- Flexible external memory controller with up to 16 -bit data bus: SRAM, PSRAM, SDRAM/LPSDR SDRAM, NOR/NAND Flash memories
- Dual mode QuadSPI interface
- LCD parallel interface, 8080/6800 modes
- Clock, reset and supply management
- 1.7 V to 3.6 V application supply and I/Os
- POR, PDR, PVD and BOR
- 4 to 26 MHz crystal oscillator
- Internal 16 MHz factory-trimmed RC (1\% accuracy)
- 32 kHz oscillator for RTC with calibration
- Internal 32 kHz RC with calibration
- Low power
- Sleep, Stop and Standby modes
- $V_{\text {BAT }}$ supply for RTC, $20 \times 32$ bit backup registers plus optional 4 KB backup SRAM
- $3 \times 12$-bit, 2.4 MSPS ADC: up to 24 channels and 7.2 MSPS in triple interleaved mode
- $2 \times 12$-bit D/A converters
- General-purpose DMA: 16-stream DMA controller with FIFOs and burst support
- Up to 17 timers: $2 x$ watchdog, $1 \times$ SysTick timer and up to twelve 16-bit and two 32-bit timers up to 180 MHz , each with up to four IC/OC/PWM or pulse counter
- Debug mode
- SWD and JTAG interfaces
- Cortex ${ }^{\circledR}$-M4 Trace Macrocell ${ }^{\text {TM }}$

- Up to 114 I/O ports with interrupt capability
- Up to 111 fast I/Os up to 90 MHz
- Up to 1125 V-tolerant I/Os
- Up to 20 communication interfaces
- SPDIF-Rx
- Up to $4 \times I^{2} \mathrm{C}$ interfaces (SMBus/PMBus)
- Up to four USARTs and two UARTs (11.25 Mbit/s, ISO7816 interface, LIN, IrDA, modem control)
- Up to four SPIs (45 Mbits/s), three with muxed $I^{2} S$ for audio class accuracy via internal audio PLL or external clock
- $2 x$ SAI (serial audio interface)
- $2 \times$ CAN (2.0B Active)
- SDIO interface
- Consumer electronics control (CEC) I/F
- Advanced connectivity
- USB 2.0 full-speed device/host/OTG controller with on-chip PHY
- USB 2.0 high-speed/full-speed device/host/OTG controller with dedicated DMA, on-chip full-speed PHY and ULPI
- Dedicated USB power rail enabling on-chip PHYs operation throughout the entire MCU power supply range
- 8- to 14-bit parallel camera interface up to 54 Mbytes/s
- CRC calculation unit
- RTC: subsecond accuracy, hardware calendar
- 96-bit unique ID

## Contents

1 Introduction ..... 11
2 Description ..... 12
2.1 Compatibility with STM32F4 family ..... 14
3 Functional overview ..... 17
3.1 Arm $^{\circledR}$ Cortex $^{\circledR}$-M4 with FPU and embedded Flash and SRAM ..... 17
3.2 Adaptive real-time memory accelerator (ART Accelerator ${ }^{\text {TM }}$ ) ..... 17
3.3 Memory protection unit ..... 17
3.4 Embedded Flash memory ..... 18
3.5 CRC (cyclic redundancy check) calculation unit ..... 18
3.6 Embedded SRAM ..... 18
3.7 Multi-AHB bus matrix ..... 18
3.8 DMA controller (DMA) ..... 19
3.9 Flexible memory controller (FMC) ..... 20
3.10 Quad SPI memory interface (QUADSPI) ..... 20
3.11 Nested vectored interrupt controller (NVIC) ..... 21
3.12 External interrupt/event controller (EXTI) ..... 21
3.13 Clocks and startup ..... 21
3.14 Boot modes ..... 22
3.15 Power supply schemes ..... 22
3.16 Power supply supervisor ..... 23
3.16.1 Internal reset ON ..... 23
3.16.2 Internal reset OFF ..... 23
3.17 Voltage regulator ..... 24
3.17.1 Regulator ON ..... 24
3.17.2 Regulator OFF ..... 25
3.17.3 Regulator ON/OFF and internal reset ON/OFF availability ..... 27
3.18 Real-time clock (RTC), backup SRAM and backup registers ..... 28
3.19 Low-power modes ..... 29
$3.20 \mathrm{~V}_{\text {BAT }}$ operation ..... 29
3.21 Timers and watchdogs ..... 30
3.21.1 Advanced-control timers (TIM1, TIM8) ..... 31
3.21.2 General-purpose timers (TIMx) ..... 31
3.21.3 Basic timers TIM6 and TIM7 ..... 31
3.21.4 Independent watchdog ..... 32
3.21.5 Window watchdog ..... 32
3.21.6 SysTick timer ..... 32
3.22 Inter-integrated circuit interface $\left(I^{2} \mathrm{C}\right)$ ..... 32
3.23 Universal synchronous/asynchronous receiver transmitters (USART) ..... 32
3.24 Serial peripheral interface (SPI) ..... 33
3.25 HDMI (high-definition multimedia interface) consumer electronics control (CEC) ..... 33
3.26 Inter-integrated sound ( ${ }^{2} \mathrm{~S}$ ) ..... 34
3.27 SPDIF-RX Receiver Interface (SPDIFRX) ..... 34
3.28 Serial audio interface (SAI) ..... 34
3.29 Audio PLL (PLLI2S) ..... 35
3.30 Serial audio interface PLL (PLLSAI) ..... 35
3.31 Secure digital input/output interface (SDIO) ..... 35
3.32 Controller area network (bxCAN) ..... 35
3.33 Universal serial bus on-the-go full-speed (OTG_FS) ..... 36
3.34 Universal serial bus on-the-go high-speed (OTG_HS) ..... 36
3.35 Digital camera interface (DCMI) ..... 37
3.36 General-purpose input/outputs (GPIOs) ..... 37
3.37 Analog-to-digital converters (ADCs) ..... 37
3.38 Temperature sensor ..... 37
3.39 Digital-to-analog converter (DAC) ..... 38
3.40 Serial wire JTAG debug port (SWJ-DP) ..... 38

## 1 Introduction

This document provides the description of the STM32F446xC/E products, based on an Arm ${ }^{\circledR(a)}$ core. It must be read in conjunction with the RM0390 reference manual, available on www.st.com.

For information on the Cortex ${ }^{\circledR}-\mathrm{M} 4$ core refer to the Cortex ${ }^{\circledR}-\mathrm{M} 4$ programming manual (PM0214), available on www.st.com.
a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

## 2 Description

The STM32F446xC/E devices are based on the high-performance Arm ${ }^{\circledR}$ Cortex ${ }^{\circledR}$-M4 32-bit RISC core operating at a frequency of up to 180 MHz . The Cortex-M4 core features a floating point unit (FPU) single precision supporting all Arm ${ }^{\circledR}$ single-precision data-processing instructions and data types. It also implements a full set of DSP instructions and a memory protection unit (MPU) that enhances application security.

The STM32F446xC/E devices incorporate high-speed embedded memories (Flash memory up to 512 Kbytes, up to 128 Kbytes of SRAM), up to 4 Kbytes of backup SRAM, and an extensive range of enhanced I/Os and peripherals connected to two APB buses, two AHB buses and a 32-bit multi-AHB bus matrix.

All devices offer three 12-bit ADCs, two DACs, a low-power RTC, twelve general-purpose 16-bit timers including two PWM timers for motor control, two general-purpose 32-bit timers.

They also feature standard and advanced communication interfaces.

- Up to four $I^{2} \mathrm{Cs}$
- Four SPIs, three $I^{2}$ Ss full simplex: to achieve audio class accuracy, the $I^{2} S$ peripherals can be clocked via a dedicated internal audio PLL or via an external clock to allow synchronization
- Four USARTs plus two UARTs
- An USB OTG full-speed and an USB OTG high-speed with full-speed capability (with the ULPI), both with dedicated power rails allowing to use them throughout the whole power range
- Two CANs
- Two SAls serial audio interfaces: to achieve audio class accuracy, the SAls can be clocked via a dedicated internal audio PLL
- SDIO/MMC interface
- Camera interface
- HDMI-CEC
- SPDIF receiver (SPDIFRx)
- QuadSPI

Advanced peripherals include an SDIO, a flexible memory control (FMC) interface, a camera interface for CMOS sensors. Refer to Table 2 for the list of peripherals available on each part number.

The STM32F446xC/E devices operate in the -40 to $+105^{\circ} \mathrm{C}$ temperature range from a 1.7 to 3.6 V power supply.

The supply voltage can drop down to 1.7 V with the use of an external power supply supervisor (refer to Section 3.16.2: Internal reset OFF). A comprehensive set of power-saving modes enables the design of low-power applications.

The STM32F446xC/E devices offer devices in six packages, ranging from 64 to 144 pins. The set of included peripherals changes with the chosen device.
These features make the STM32F446xC/E microcontrollers suitable for a wide range of applications, namely motor drive and control, medical equipment, industrial (PLC, inverters, circuit breakers), printers, and scanners, alarm systems, video intercom and HVAC, and home audio appliances.

| Packages |  | WLCSP81 |  | LQFP64 |  | LQFP100 |  | LQFP144 UFBGA144 |  |

1. For the LQFP100 package only FMC Bank1 is available, it can only support a multiplexed NOR/PSRAM memory using the NE1 Chip Select. The interrupt line cannot be used as Port G is not available on this package.
2. The SPI1, SPI2 and SPI3 interfaces give the flexibility to work in an exclusive way in either SPI mode or I2S audio mode.
3. For the LQFP64 package the Quad SPI is available with limited features.
4. $V_{D D} / V_{\text {DDA }}$ minimum value of 1.7 V is obtained when the device operates in reduced temperature range, and with the use of an external power supply supervisor (refer to Section 3.16.2: Internal reset OFF).

### 2.1 Compatibility with STM32F4 family

The STM32F446xC/xV is software and feature compatible with the STM32F4 family.
The STM32F446xC/xV can be used as drop-in replacement of the other STM32F4 products but some small changes have to be done on the PCB board.

Figure 1. Compatible board design for LQFP100 package

Figure 2. Compatible board for LQFP64 package

Figure 3 shows the STM32F446xx block diagram.

Figure 3. STM32F446xC/E block diagram

## 3 Functional overview

### 3.1 Arm ${ }^{\circledR}$ Cortex ${ }^{\circledR}$-M4 with FPU and embedded Flash and SRAM

#### Abstract

The Arm ${ }^{\circledR}$ Cortex ${ }^{\circledR}-\mathrm{M} 4$ with FPU processor is the latest generation of Arm processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts. The Arm ${ }^{\circledR}$ Cortex ${ }^{\circledR}$-M4 with FPU core is a 32-bit RISC processor that features exceptional code-efficiency, delivering the high-performance expected from an Arm core in the memory size usually associated with 8 - and 16-bit devices.

The processor supports a set of DSP instructions which allow efficient signal processing and complex algorithm execution.
Its single precision FPU (floating point unit) speeds up software development by using metalanguage development tools, while avoiding saturation.

The STM32F446xC/E family is compatible with all Arm tools and software.
Figure 3 shows the general block diagram of the STM32F446xC/E family.
Note: $\quad$ Cortex-M4 with FPU core is binary compatible with the Cortex-M3 core.

### 3.2 Adaptive real-time memory accelerator (ART Accelerator ${ }^{\text {TM }}$ )

The ART Accelerator is a memory accelerator optimized for STM32 industry-standard Arm ${ }^{\circledR}$ Cortex ${ }^{\circledR}-\mathrm{M} 4$ with FPU processors. It balances the inherent performance advantage of the Arm ${ }^{\circledR}$ Cortex ${ }^{\circledR}$-M4 with FPU over Flash memory technologies, which normally requires the processor to wait for the Flash memory at higher frequencies.

To release the processor full 225 DMIPS performance at this frequency, the accelerator implements an instruction prefetch queue and branch cache, which increases program execution speed from the 128 -bit Flash memory. Based on CoreMark ${ }^{\circledR}$ benchmark, the performance achieved thanks to the ART Accelerator is equivalent to 0 wait state program execution from Flash memory at a CPU frequency up to 180 MHz .

### 3.3 Memory protection unit

The memory protection unit (MPU) is used to manage the CPU accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task. This memory area is organized into up to 8 protected areas that can in turn be divided up into eight subareas. The protection area sizes are between 32 bytes and the whole 4 Gbytes of addressable memory.

The MPU is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (realtime operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

### 3.4 Embedded Flash memory

The devices embed a Flash memory of 512KB available for storing programs and data.

### 3.5 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a software signature during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

### 3.6 Embedded SRAM

All devices embed:

- Up to 128 Kbytes of system SRAM

RAM is accessed (read/write) at CPU clock speed with 0 wait states.

- 4 Kbytes of backup SRAM

This area is accessible only from the CPU. Its content is protected against possible unwanted write accesses, and is retained in Standby or VBAT modes.

### 3.7 Multi-AHB bus matrix

The 32-bit multi-AHB bus matrix interconnects all the masters (CPU, DMAs, USB HS) and the slaves Flash memory, RAM, QuadSPI, FMC, AHB and APB peripherals and ensures a seamless and efficient operation even when several high-speed peripherals work simultaneously.

Figure 4. STM32F446xC/E and Multi-AHB matrix

### 3.8 DMA controller (DMA)

The devices feature two general-purpose dual-port DMAs (DMA1 and DMA2) with 8 streams each. They are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. They feature dedicated FIFOs for APB/AHB peripherals, support burst transfer and are designed to provide the maximum peripheral bandwidth (AHB/APB).

The two DMA controllers support circular buffer management, so that no specific code is needed when the controller reaches the end of the buffer. The two DMA controllers also have a double buffering feature, which automates the use and switching of two memory buffers without requiring any special code.

Each stream is connected to dedicated hardware DMA requests, with support for software trigger on each stream. Configuration is made by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals:

- $\quad S P I$ and $I^{2} S$
- $\quad I^{2} C$
- USART
- General-purpose, basic and advanced-control timers TIMx
- DAC
- SDIO
- Camera interface (DCMI)
- ADC
- SAI1/SAI2
- SPDIF Receiver (SPDIFRx)
- QuadSPI

## $3.9 \quad$ Flexible memory controller (FMC)

All devices embed an FMC. It has seven Chip Select outputs supporting the following modes: SDRAM/LPSDR SDRAM, SRAM, PSRAM, NOR Flash and NAND Flash. With the possibility to remap FMC bank 1 (NOR/PSRAM 1 and 2 ) and FMC SDRAM bank $1 / 2$ in the Cortex-M4 code area.

Functionality overview:

- 8-,16-bit data bus width
- Read FIFO for SDRAM controller
- Write FIFO
- Maximum FMC_CLK/FMC_SDCLK frequency for synchronous accesses is 90 MHz .

## LCD parallel interface

The FMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes, and is flexible enough to adapt to specific LCD interfaces. This LCD parallel interface capability makes it easy to build costeffective graphic applications using LCD modules with embedded controllers or high performance solutions using external controllers with dedicated acceleration.

### 3.10 Quad SPI memory interface (QUADSPI)

All devices embed a Quad SPI memory interface, which is a specialized communication interface targeting Single, Dual or Quad SPI Flash memories. It can work in direct mode through registers, external Flash status register polling mode and memory mapped mode. Up to 256 Mbytes external Flash are memory mapped, supporting 8, 16 and 32-bit access. Code execution is supported. The opcode and the frame format are fully programmable. Communication can be either in Single Data Rate or Dual Data Rate.

### 3.11 Nested vectored interrupt controller (NVIC)

The devices embed a nested vectored interrupt controller able to manage 16 priority levels, and handle up to 91 maskable interrupt channels plus the 16 interrupt lines of the Cortex ${ }^{\circledR}$ M4 with FPU core.

- Closely coupled NVIC gives low-latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Early processing of interrupts
- Processing of late arriving, higher-priority interrupts
- Supports tail chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimum interrupt latency.

### 3.12 External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 23 edge-detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 114 GPIOs can be connected to the 16 external interrupt lines.

### 3.13 Clocks and startup

On reset the 16 MHz internal RC oscillator is selected as the default CPU clock. The 16 MHz internal RC oscillator is factory-trimmed to offer $1 \%$ accuracy at $25^{\circ} \mathrm{C}$. The application can then select as system clock either the RC oscillator or an external $4-26 \mathrm{MHz}$ clock source. This clock can be monitored for failure. If a failure is detected, the system automatically switches back to the internal RC oscillator and a software interrupt is generated (if enabled). This clock source is input to a PLL thus allowing to increase the frequency up to 180 MHz . Similarly, full interrupt management of the PLL clock entry is available when necessary (for example if an indirectly used external oscillator fails).

Several prescalers allow the configuration of the two AHB buses, the high-speed APB (APB2) and the low-speed APB (APB1) domains. The maximum frequency of the two AHB buses is 180 MHz while the maximum frequency of the high-speed APB domains is 90 MHz . The maximum allowed frequency of the low-speed APB domain is 45 MHz .

The devices embed a dedicated PLL (PLLI2S) and PLLSAI, which makes it possible to achieve audio class performance. In this case, the $I^{2} S$ master clock can generate all standard sampling frequencies from 8 to 192 kHz .

### 3.14 Boot modes

At startup, boot pins are used to select one out of three boot options:

- Boot from user Flash
- Boot from system memory
- Boot from embedded SRAM

The boot loader is located in system memory. It is used to reprogram the Flash memory through a serial (UART, $I^{2} C, C A N, S P I$ and USB) communication interface. Refer to application note AN2606 for details.

### 3.15 Power supply schemes

- $\quad \mathrm{V}_{\mathrm{DD}}=1.7$ to 3.6 V : external power supply for I/Os and the internal regulator (when enabled), provided externally through $\mathrm{V}_{\mathrm{DD}}$ pins.
- $\quad \mathrm{V}_{\mathrm{SSA}}, \mathrm{V}_{\mathrm{DDA}}=1.7$ to 3.6 V : external analog power supplies for ADC , DAC, Reset blocks, RCs and PLL. $\mathrm{V}_{\mathrm{DDA}}$ and $\mathrm{V}_{\text {SSA }}$ must be connected to $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{SS}}$, respectively.

Note: $\quad V_{D D} / V_{D D A}$ minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to Section 3.16.2). Refer to Table 3 to identify the packages supporting this option.

- $\quad \mathrm{V}_{\text {BAT }}=1.65$ to 3.6 V : power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when $V_{D D}$ is not present.
- $\quad V_{\text {DDUSB }}$ can be connected either to $\mathrm{V}_{\mathrm{DD}}$ or an external independent power supply (3.0 to 3.6 V ) for USB transceivers.
For example, when device is powered at 1.8 V , an independent power supply 3.3 V can be connected to $V_{\text {DDUSB }}$. When the $\mathrm{V}_{\text {DDUSB }}$ is connected to a separated power supply, it is independent from $\mathrm{V}_{D D}$ or $\mathrm{V}_{\text {DDA }}$ but it must be the last supply to be provided and the first to disappear. The following conditions must be respected:
- During power-on phase $\left(\mathrm{V}_{\mathrm{DD}}<\mathrm{V}_{\mathrm{DD} \text { _MIN }}\right), \mathrm{V}_{\text {DDUSB }}$ must be always lower than $\mathrm{V}_{\mathrm{DD}}$
- During power-down phase ( $\left.\mathrm{V}_{\mathrm{DD}}<\mathrm{V}_{\mathrm{DD} \text { _MIN }}\right), \mathrm{V}_{\text {DDUSB }}$ must be always lower than $V_{D D}$
- $\quad V_{\text {DDUSB }}$ rising and falling time rate specifications must be respected.
- In operating mode phase, $V_{D D U S B}$ can be lower or higher than $V_{D D}$ :
- If USB (USB OTG_HS/OTG_FS) is used, the associated GPIOs powered by $V_{\text {DDUSB }}$ are operating between $V_{\text {DDUSB MIN }}$ and $V_{\text {DDUSB }}$ MAX. The $V_{\text {DDUSB }}$ supplies both USB transceivers (USB OTG_HS and USB OTG_FS).
- If only one USB transceiver is used in the application, the GPIOs associated to the other USB transceiver are still supplied by $V_{\text {DDUSB }}$.
- If USB (USB OTG_HS/OTG_FS) is not used, the associated GPIOs powered by $\mathrm{V}_{\text {DDUSB }}$ are operating between $\mathrm{V}_{\text {DD_MIN }}$ and $\mathrm{V}_{\text {DD_MAX }}$.

Figure 5. $\mathrm{V}_{\text {DDUSB }}$ connected to an external independent power supply

### 3.16 Power supply supervisor

### 3.16.1 Internal reset ON

On packages embedding the PDR_ON pin, the power supply supervisor is enabled by holding PDR_ON high. On the other package, the power supply supervisor is always enabled.

The device has an integrated power-on reset (POR)/ power-down reset (PDR) circuitry coupled with a Brownout reset (BOR) circuitry. At power-on, POR/PDR is always active and ensures proper operation starting from 1.8 V . After the 1.8 V POR threshold level is reached, the option byte loading process starts, either to confirm or modify default BOR thresholds, or to disable BOR permanently. Three BOR thresholds are available through option bytes. The device remains in reset mode when $V_{D D}$ is below a specified threshold, $V_{\text {POR/PDR }}$ or $\mathrm{V}_{\mathrm{BOR}}$, without the need for an external reset circuit.

The device also features an embedded programmable voltage detector (PVD) that monitors the $V_{D D} / V_{D D A}$ power supply and compares it to the $V_{P V D}$ threshold. An interrupt can be generated when $V_{D D} / V_{D D A}$ drops below the $V_{P V D}$ threshold and/or when $V_{D D} / V_{D D A}$ is higher than the $V_{P V D}$ threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.16.2 Internal reset OFF

This feature is available only on packages featuring the PDR_ON pin. The internal power-on reset (POR) / power-down reset (PDR) circuitry is disabled through the PDR_ON pin.

An external power supply supervisor should monitor $V_{D D}$ and maintain the device in reset mode as long as $\mathrm{V}_{D D}$ is below a specified threshold. PDR_ON must be connected to $\mathrm{V}_{\mathrm{SS}}$, to let the device operate down to 1.7 V . Refer to Figure 6.

Figure 6. Power supply supervisor interconnection with internal reset OFF

The $\mathrm{V}_{\mathrm{DD}}$ specified threshold, below which the device must be maintained under reset, is 1.7 V .

A comprehensive set of power-saving mode enables the design low-power applications.
When the internal reset is OFF, the following integrated features are no more supported:

- The integrated power-on reset (POR) / power-down reset (PDR) circuitry is disabled
- The brownout reset (BOR) circuitry must be disabled
- The embedded programmable voltage detector (PVD) is disabled
- $\quad \mathrm{V}_{\mathrm{BAT}}$ functionality is no more available and $\mathrm{V}_{\text {BAT }}$ pin should be connected to $\mathrm{V}_{\mathrm{DD}}$.

All packages, except for the LQFP100/LQFP64, allow to disable the internal reset through the PDR_ON signal.

### 3.17 Voltage regulator

The regulator has four operating modes:

- Regulator ON
- Main regulator mode (MR)
- Low power regulator (LPR)
- Power-down
- Regulator OFF

### 3.17.1 Regulator ON

On packages embedding the BYPASS_REG pin, the regulator is enabled by holding BYPASS_REG low. On all other packages, the regulator is always enabled.

There are three power modes configured by software when the regulator is ON:

- MR mode used in Run/sleep modes or in Stop modes
- In Run/Sleep mode

The MR mode is used either in the normal mode (default mode) or the over-drive mode (enabled by software). Different voltages scaling are provided to reach the best compromise between maximum frequency and dynamic power consumption.

The over-drive mode makes possible operating at a frequency higher than the normal mode for a given voltage scaling.

- In Stop modes

The MR can be configured in two ways during stop mode:
MR operates in normal mode (default mode of MR in stop mode)
MR operates in under-drive mode (reduced leakage mode).

- LPR is used in the Stop modes:

The LP regulator mode is configured by software when entering Stop mode.
Like the MR mode, the LPR can be configured in two ways during stop mode:

- LPR operates in normal mode (default mode when LPR is ON)
- LPR operates in under-drive mode (reduced leakage mode).
- Power-down is used in Standby mode.

The Power-down mode is activated only when entering in Standby mode. The regulator output is in high impedance and the kernel circuitry is powered down, inducing zero consumption. The contents of the registers and SRAM are lost.

Refer to Table 3 for a summary of voltage regulator modes versus device operating modes.
Two external ceramic capacitors should be connected on $\mathrm{V}_{\mathrm{CAP}} 1$ and $\mathrm{V}_{\mathrm{CAP}}$ 2 $p i n$.
All packages have the regulator ON feature.
Table 3. Voltage regulator configuration mode versus device operating mode ${ }^{(1)}$

| Voltage regulator <br> configuration | Run mode | Sleep mode | Stop mode | Standby mode |
| :---: | :---: | :---: | :---: | :---: |
| Normal mode | MR | MR | MR or LPR | - |
| Over-drive <br> mode | MR | MR | - | - |
| Under-drive mode | - | - | MR or LPR | - |
| Power-down <br> mode | - | - | - | Yes |

1. ' - ' means that the corresponding configuration is not available.
2. The over-drive mode is not available when $\mathrm{V}_{\mathrm{DD}}=1.7$ to 2.1 V .

### 3.17.2 Regulator OFF

This feature is available only on packages featuring the BYPASS_REG pin. The regulator is disabled by holding BYPASS_REG high. The regulator OFF mode enables to supply externally a $\mathrm{V}_{12}$ voltage source through $\mathrm{V}_{\mathrm{CAP}_{-} 1}$ and $\mathrm{V}_{\mathrm{CAP}}$ 2 1 pins.
Since the internal voltage scaling is not managed internally, the external voltage value must be aligned with the targeted maximum frequency. The two $2.2 \mu \mathrm{~F}$ ceramic capacitors should be replaced by two 100 nF decoupling capacitors.
When the regulator is OFF, there is no more internal monitoring on $V_{12}$. An external power supply supervisor should be used to monitor the $\mathrm{V}_{12}$ of the logic power domain. PA0 pin should be used for this purpose, and act as power-on reset on $\mathrm{V}_{12}$ power domain.

In regulator OFF mode, the following features are no more supported:

- PAO cannot be used as a GPIO pin since it resets a part of the $\mathrm{V}_{12}$ logic power domain not reset by the NRST pin.
- As long as PAO is kept low, the debug mode cannot be used under power-on reset. As a consequence, PAO and NRST pins must be managed separately if the debug connection under reset or pre-reset is required.
- The over-drive and under-drive modes are not available.

Figure 7. Regulator OFF

The following conditions must be respected:

- $\quad V_{D D}$ should always be higher than $\mathrm{V}_{\mathrm{CAP} \text { _1 }}$ and $\mathrm{V}_{\mathrm{CAP} \text { _2 }}$ to avoid current injection between power domains.
- If the time for $V_{C A P \_1}$ and $V_{C A P \_2}$ to reach $V_{12}$ minimum value is faster than the time for $V_{D D}$ to reach 1.7 V , then PA0 should be kept low to cover both conditions: until $\mathrm{V}_{\mathrm{CAP}}$ _1 and $V_{C A P} 2$ reach $V_{12}$ minimum value and until $V_{D D}$ reaches 1.7 V (see Figure 8).
- Otherwise, if the time for $\mathrm{V}_{\text {CAP }} 1$ and $\mathrm{V}_{\text {CAP }} 2$ to reach $\mathrm{V}_{12}$ minimum value is slower than the time for $\mathrm{V}_{\mathrm{DD}}$ to reach $\overline{1} .7 \mathrm{~V}$, then PAO could be asserted low externally (see Figure 9).
- If $\mathrm{V}_{\mathrm{CAP}} 1$ and $\mathrm{V}_{\mathrm{CAP}}$ 2 go below $\mathrm{V}_{12}$ minimum value and $\mathrm{V}_{\mathrm{DD}}$ is higher than 1.7 V , then a reset must be asserted on PA0 pin.
Note: $\quad$ The minimum value of $V_{12}$ depends on the maximum frequency targeted in the application.

Figure 8. Startup in regulator OFF: slow $\mathrm{V}_{\mathrm{DD}}$ slope power-down reset risen after $\mathrm{V}_{\mathrm{CAP} 1} / \mathrm{V}_{\mathrm{CAP}}$ 2 stabilization

1. This figure is valid whatever the internal reset mode (ON or OFF).

Figure 9. Startup in regulator OFF mode: fast $\mathrm{V}_{\mathrm{DD}}$ slope power-down reset risen before $\mathrm{V}_{\mathrm{CAP}}{ }_{1} / \mathrm{V}_{\mathrm{CAP}}$ 2 stabilization

1. This figure is valid whatever the internal reset mode (ON or OFF).

### 3.17.3 Regulator ON/OFF and internal reset ON/OFF availability

Table 4. Regulator ON/OFF and internal reset ON/OFF availability

| Package | Regulator ON | Regulator OFF | Internal reset ON | Internal reset OFF |
| :---: | :---: | :---: | :---: | :---: |
| LQFP64 / LQFP100 | Yes | No | Yes | No |
| LQFP144 | Yes | No | $\begin{aligned} & \text { Yes } \\ & \text { PDR_ON } \\ & \text { set to } V_{D D} \end{aligned}$ | Yes <br> PDR_ON set to Vss |
| UFBGA144 | $\begin{gathered} \text { Yes } \\ \text { BYPASS_REG } \\ \text { set to Vss } \end{gathered}$ | $\begin{gathered} \text { Yes } \\ \text { BYPASS_REG } \\ \text { set to } V_{D D} \end{gathered}$ |  |  |
| WLCSP81 |  |  |  |  |

### 3.18 Real-time clock (RTC), backup SRAM and backup registers

The backup domain includes:

- The real-time clock (RTC)
- 4 Kbytes of backup SRAM
- 20 backup registers

The real-time clock (RTC) is an independent BCD timer/counter. Dedicated registers contain the second, minute, hour (in 12/24 hour), week day, date, month, year, in BCD (binarycoded decimal) format. Correction for 28, 29 (leap year), 30, and 31 day of the month are performed automatically. The RTC provides a programmable alarm and programmable periodic interrupts with wakeup from Stop and Standby modes. The sub-seconds value is also available in binary format.

It is clocked by a 32.768 kHz external crystal, resonator or oscillator, the internal low-power RC oscillator or the high-speed external clock divided by 128 . The internal low-speed RC has a typical frequency of 32 kHz . The RTC can be calibrated using an external 512 Hz output to compensate for any natural quartz deviation.

Two alarm registers are used to generate an alarm at a specific time and calendar fields can be independently masked for alarm comparison. To generate a periodic interrupt, a 16-bit programmable binary auto-reload downcounter with programmable resolution is available and enables automatic wakeup and periodic alarms from every $120 \mu$ s to every 36 hours.

A 20-bit prescaler is used for the time base clock. It is by default configured to generate a time base of 1 second from a clock at 32.768 kHz .

The 4-Kbyte backup SRAM is an EEPROM-like memory area. It can be used to store data which need to be retained in VBAT and standby mode. This memory area is disabled by default to minimize power consumption (see Section 3.19). It can be enabled by software.

The backup registers are 32-bit registers used to store 80 bytes of user application data when $\mathrm{V}_{\mathrm{DD}}$ power is not present. Backup registers are not reset by a system, a power reset, or when the device wakes up from the Standby mode (see Section 3.19).

Additional 32-bit registers contain the programmable alarm subseconds, seconds, minutes, hours, day, and date

Like backup SRAM, the RTC and backup registers are supplied through a switch that is powered either from the $\mathrm{V}_{\mathrm{DD}}$ supply when present or from the $\mathrm{V}_{\text {BAT }}$ pin.

### 3.19 Low-power modes

The devices support three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- Sleep mode

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- Stop mode

The Stop mode achieves the lowest power consumption while retaining the contents of SRAM and registers. All clocks in the 1.2 V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled.
The voltage regulator can be put either in main regulator mode (MR) or in low-power mode (LPR). Both modes can be configured as follows (see Table 5):

- Normal mode (default mode when MR or LPR is enabled)
- Under-drive mode.

The device can be woken up from the Stop mode by any of the EXTI line (the EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm / wakeup / tamper / time stamp events, the USB OTG FS/HS wakeup).

Table 5. Voltage regulator modes in stop mode

| Voltage regulator configuration | Main regulator (MR) | Low-power regulator (LPR) |
| :---: | :---: | :---: |
| Normal mode | MR ON | LPR ON |
| Under-drive mode | MR in under-drive mode | LPR in under-drive mode |

- Standby mode

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.2 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, the SRAM and register contents are lost except for registers in the backup domain and the backup SRAM when selected.
The device exits the Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin, or an RTC alarm / wakeup / tamper /time stamp event occurs.
The standby mode is not supported when the embedded voltage regulator is bypassed and the 1.2 V domain is controlled by an external power.

## $3.20 \quad \mathrm{~V}_{\mathrm{BAT}}$ operation

The $\mathrm{V}_{\mathrm{BAT}}$ pin makes it possible to power the device $\mathrm{V}_{\mathrm{BAT}}$ domain from an external battery, an external supercapacitor, or from $V_{D D}$ when no external battery and an external supercapacitor are present.
$V_{B A T}$ operation is activated when $V_{D D}$ is not present.
The $V_{B A T}$ pin supplies the RTC, the backup registers and the backup SRAM.

Note: $\quad$ When the microcontroller is supplied from $V_{B A T}$, external interrupts and RTC alarm/events do not exit it from $V_{B A T}$ operation.
When PDR_ON pin is not connected to $V_{D D}$ (Internal Reset OFF), the $V_{B A T}$ functionality is no more available and $V_{B A T}$ pin has to be connected to VDD.

### 3.21 Timers and watchdogs

The devices include two advanced-control timers, eight general-purpose timers, two basic timers and two watchdog timers.
All timer counters can be frozen in debug mode.
Table 6 compares the features of the advanced-control, general-purpose and basic timers.
Table 6. Timer feature comparison

| Timer type | Timer | Counter resolution | Counter type | Prescaler factor | DMA request generation | Capture/ compare channels | Complementary output | ```Max interface clock (MHz)``` | $\begin{gathered} \text { Max } \\ \text { timer } \\ \text { clock } \\ (\mathrm{MHz})^{(1)} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Advancedcontrol | TIM1, TIM8 | 16-bit | Up, Down, Up/down | Any integer between 1 and 65536 | Yes | 4 | Yes | 90 | 180 |
| General purpose | TIM2, <br> TIM5 | 32-bit | Up, Down, Up/down | Any integer between 1 and 65536 | Yes | 4 | No | 45 | 90/180 |
|  | TIM3, <br> TIM4 | 16-bit | Up, Down, Up/down | Any integer between 1 and 65536 | Yes | 4 | No | 45 | 90/180 |
|  | TIM9 | 16-bit | Up | Any integer between 1 and 65536 | No | 2 | No | 90 | 180 |
|  | TIM10, TIM11 | 16-bit | Up | Any integer between 1 and 65536 | No | 1 | No | 90 | 180 |
|  | TIM12 | 16-bit | Up | Any integer between 1 and 65536 | No | 2 | No | 45 | 90/180 |
|  | TIM13, TIM14 | 16-bit | Up | Any integer between 1 and 65536 | No | 1 | No | 45 | 90/180 |
| Basic | TIM6, <br> TIM7 | 16-bit | Up | Any integer between 1 and 65536 | Yes | 0 | No | 45 | 90/180 |

1. The maximum timer clock is either 90 or 180 MHz depending on TIMPRE bit configuration in the RCC_DCKCFGR register.

### 3.21.1 Advanced-control timers (TIM1, TIM8)

The advanced-control timers (TIM1, TIM8) can be seen as three-phase PWM generators multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead times. They can also be considered as complete general-purpose timers. Their 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge- or center-aligned modes)
- One-pulse mode output

If configured as standard 16-bit timers, they have the same features as the general-purpose TIMx timers. If configured as 16-bit PWM generators, they have full modulation capability (0100\%).

The advanced-control timer can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

TIM1 and TIM8 support independent DMA request generation.

### 3.21.2 General-purpose timers (TIMx)

There are ten synchronized general-purpose timers embedded in the STM32F446xC/E devices (see Table 6 for differences).

- TIM2, TIM3, TIM4, TIM5

The STM32F446xC/E include four full-featured general-purpose timers: TIM2, TIM5, TIM3, and TIM4.The TIM2 and TIM5 timers are based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler. The TIM3 and TIM4 timers are based on a 16bit auto-reload up/downcounter and a 16-bit prescaler. They all feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. This gives up to 16 input capture/output compare/PWMs on the largest packages.
The TIM2, TIM3, TIM4, TIM5 general-purpose timers can work together, or with the other general-purpose timers and the advanced-control timers TIM1 and TIM8 via the Timer Link feature for synchronization or event chaining.
Any of these general-purpose timers can be used to generate PWM outputs.
TIM2, TIM3, TIM4, TIM5 all have independent DMA request generation. They are capable of handling quadrature (incremental) encoder signals and the digital outputs from one to four Hall-effect sensors.

- TIM9, TIM10, TIM11, TIM12, TIM13, and TIM14

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM10, TIM11, TIM13, and TIM14 feature one independent channel, whereas TIM9 and TIM12 have two independent channels for input capture/output compare, PWM or one-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers. They can also be used as simple time bases.

### 3.21.3 Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger and waveform generation. They can also be used as a generic 16-bit time base.
TIM6 and TIM7 support independent DMA request generation.

### 3.21.4 Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes.

### 3.21.5 Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### 3.21.6 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard downcounter. It features:

- A 24-bit downcounter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source.

### 3.22 Inter-integrated circuit interface $\left(I^{2} \mathrm{C}\right)$

Four $I^{2} \mathrm{C}$ bus interfaces can operate in multimaster and slave modes. Three $\mathrm{I}^{2} \mathrm{C}$ can support the standard (up to 100 KHz ) and fast (up to 400 KHz ) modes.

One $I^{2} \mathrm{C}$ can support the standard (up to 100 KHz ), fast (up to 400 KHz ) and fast mode plus (up to 1 MHz ) modes.

They (all $I^{2} \mathrm{C}$ ) support the $7 / 10$-bit addressing mode and the 7 -bit dual addressing mode (as slave).

A hardware CRC generation/verification is embedded.
They can be served by DMA and they support SMBus 2.0 / PMBus.
The devices also include programmable analog and digital noise filters (see Table 7).
Table 7. Comparison of I2C analog and digital filters

| - | Analog filter | Digital filter |
| :---: | :---: | :--- |
| Pulse width of suppressed spikes | $\geq 50 \mathrm{~ns}$ | Programmable length from 1 to 15 I2C peripheral clocks |

### 3.23 Universal synchronous/asynchronous receiver transmitters (USART)

The devices embed four universal synchronous/asynchronous receiver transmitters (USART1, USART2, USART3 and USART6) and four universal asynchronous receiver transmitters (UART4, and UART5).

These six interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability. The USART1 and USART6 interfaces are able to communicate at speeds of up to $11.25 \mathrm{Mbit} / \mathrm{s}$. The other available interfaces communicate at up to 5.62 bit/s.

USART1, USART2, USART3 and USART6 also provide hardware management of the CTS and RTS signals, Smart Card mode (ISO 7816 compliant) and SPI-like communication capability. All interfaces can be served by the DMA controller.

Table 8. USART feature comparison ${ }^{(1)}$

| USART name | Standard features | Modem (RTS/CTS) | LIN | SPI master | irDA | Smartcard (ISO 7816) | Max. baud rate in Mbit/s |  | APB mapping |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Oversampling by 16 | Oversampling by 8 |  |
| USART1 | X | X | X | X | X | X | 5.62 | 11.25 | $\begin{aligned} & \text { APB2 (max. } \\ & 90 \mathrm{MHz}) \end{aligned}$ |
| USART2 | X | X | X | X | X | X | 2.81 | 5.62 | $\begin{gathered} \text { APB1 (max. } \\ \quad 45 \mathrm{MHz}) \end{gathered}$ |
| USART3 | X | X | X | X | X | X | 2.81 | 5.62 |  |
| UART4 | X | X | X | - | X | - | 2.81 | 5.62 |  |
| UART5 | X | X | X | - | X | - | 2.81 | 5.62 |  |
| USART6 | X | X | X | X | X | X | 5.62 | 11.25 | $\begin{aligned} & \text { APB2 (max. } \\ & \quad 90 \mathrm{MHz}) \end{aligned}$ |

1. $X=$ feature supported.

### 3.24 Serial peripheral interface (SPI)

The devices feature up to four SPIs in slave and master modes in full-duplex and simplex communication modes. SPI1, and SPI4 can communicate at up to $45 \mathrm{Mbits} / \mathrm{s}, \mathrm{SPI} 2$ and SPI3 can communicate at up to $22.5 \mathrm{Mbit} / \mathrm{s}$. The 3-bit prescaler gives eight master mode frequencies and the frame is configurable to 8 - or 16 -bit. The hardware CRC generation/verification supports basic SD Card/MMC modes. All SPIs can be served by the DMA controller.

The SPI interface can be configured to operate in TI mode for communications in master mode and slave mode.

### 3.25 HDMI (high-definition multimedia interface) consumer electronics control (CEC)

The devices embed a HDMI-CEC controller that provides hardware support of consumer electronics control (CEC) (Appendix supplement 1 to the HDMI standard).
This protocol provides high-level control functions between all audiovisual products in an environment. It is specified to operate at low speeds with minimum processing and memory overhead.

### 3.26 Inter-integrated sound ( $I^{2} S$ )

Three standard $\mathrm{I}^{2}$ S interfaces (multiplexed with SPI1, SPI2 and SPI3) are available. They can be operated in master or slave mode, in simplex communication modes, and can be configured to operate with a 16-/32-bit resolution as an input or output channel. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both of the $1^{2} S$ interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

All I2Sx can be served by the DMA controller.

### 3.27 SPDIF-RX Receiver Interface (SPDIFRX)

The SPDIF-RX peripheral, is designed to receive an S/PDIF flow compliant with IEC-60958 and IEC-61937. These standards support simple stereo streams up to high sample rate, and compressed multi-channel surround sound, such as those defined by Dolby or DTS (up to 5.1).

The main features of the SPDIF-RX are the following:

- Up to 4 inputs available
- Automatic symbol rate detection
- Maximum symbol rate: 12.288 MHz
- Stereo stream from 32 to 192 kHz supported
- Supports Audio IEC-60958 and IEC-61937, consumer applications
- Parity bit management
- Communication using DMA for audio samples
- Communication using DMA for control and user channel information
- Interrupt capabilities

The SPDIF-RX receiver provides all the necessary features to detect the symbol rate, and decode the incoming data stream.

The user can select the wanted SPDIF input, and when a valid signal is available the SPDIF-RX re-samples the incoming signal, decodes the Manchester stream, recognizes frames, sub-frames and blocks elements. It delivers to the CPU decoded data, and associated status flags.

The SPDIF-RX also offers a signal named spdifrx_frame_sync, which toggles at the S/PDIF sub-frame rate used to compute the exact sample rate for clock drift algorithms.

### 3.28 Serial audio interface (SAI)

The devices feature two serial audio interfaces (SAI1 and SAI2). Each serial audio interfaces based on two independent audio sub blocks which can operate as transmitter or receiver with their FIFO. Many audio protocols are supported by each block: I2S standards, LSB or MSB-justified, PCM/DSP, TDM, AC'97 and SPDIF output, supporting audio sampling frequencies from 8 kHz up to 192 kHz . Both sub blocks can be configured in master or in slave mode. The SAIs use a PLL to achieve audio class accuracy.

In master mode, the master clock can be output to the external DAC/CODEC at 256 times of the sampling frequency.

The two sub blocks can be configured in synchronous mode when full-duplex mode is required.

SAI1 and SA2 can be served by the DMA controller.

### 3.29 Audio PLL (PLLI² ${ }^{2}$ )

The devices feature an additional dedicated PLL for audio $I^{2}$ S and SAI applications, to achieve error-free $I^{2} S$ sampling clock accuracy without compromising on the CPU performance, while using USB peripherals.
The PLLI2S configuration can be modified to manage an $I^{2}$ S/SAI sample rate change without disabling the main PLL (PLL) used for CPU, USB and Ethernet interfaces.

The audio PLL can be programmed with very low error to obtain sampling rates ranging from 8 KHz to 192 KHz .

In addition to the audio PLL, a master clock input pin can be used to synchronize the $I^{2} S / S A I$ flow with an external PLL (or Codec output).

### 3.30 Serial audio interface PLL (PLLSAI)

An additional PLL dedicated to audio and USB is used for SAI1 and SAI2 peripheral in case the PLLI2S is programmed to achieve another audio sampling frequency (49.152 MHz or 11.2896 MHz ) and the audio application requires both sampling frequencies simultaneously.

The PLLSAI is also used to generate the 48 MHz clock for USB FS and SDIO in case the system PLL is programmed with factors not multiple of 48 MHz .

### 3.31 Secure digital input/output interface (SDIO)

An SD/SDIO/MMC host interface is available, that supports MultiMediaCard System Specification Version 4.2 in three different databus modes: 1-bit (default), 4-bit and 8-bit.

The interface enables data transfer at up to 48 MHz , and is compliant with the SD Memory Card Specification Version 2.0.

The SDIO Card Specification Version 2.0 is also supported with two different databus modes: 1-bit (default) and 4-bit.
The current version supports only one SD/SDIO/MMC4.2 card at any one time and a stack of MMC4.1 or previous.

### 3.32 Controller area network (bxCAN)

The two CANs are compliant with the 2.0A and B (active) specifications with a bitrate up to 1 $\mathrm{Mbit} / \mathrm{s}$. They can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. Each CAN has three transmit mailboxes, two receive FIFOS with 3 stages and 28 shared scalable filter banks (all of them can be used even if one CAN is used). 256 bytes of SRAM are allocated for each CAN.

### 3.33 Universal serial bus on-the-go full-speed (OTG_FS)

The devices embed an USB OTG full-speed device/host/OTG peripheral with integrated transceivers. The USB OTG FS peripheral is compliant with the USB 2.0 specification and with the OTG 1.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG full-speed controller requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator. The USB has dedicated power rails allowing its use throughout the entire power range. The major features are:

- Combined Rx and Tx FIFO size of $320 \times 35$ bits with dynamic FIFO sizing
- Supports the session request protocol (SRP) and host negotiation protocol (HNP)
- 6 bidirectional endpoints
- 12 host channels with periodic OUT support
- HNP/SNP/IP inside (no need for any external resistor)
- For OTG/Host modes, a power switch is needed in case bus-powered devices are connected

### 3.34 Universal serial bus on-the-go high-speed (OTG_HS)

The devices embed a USB OTG high-speed (up to $480 \mathrm{Mb} / \mathrm{s}$ ) device/host/OTG peripheral. The USB OTG HS supports both full-speed and high-speed operations. It integrates the transceivers for full-speed operation ( $12 \mathrm{MB} / \mathrm{s}$ ) and features a UTMI low-pin interface (ULPI) for high-speed operation ( $480 \mathrm{MB} / \mathrm{s}$ ). When using the USB OTG HS in HS mode, an external PHY device connected to the ULPI is required

The USB OTG HS peripheral is compliant with the USB 2.0 specification and with the OTG 1.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG full-speed controller requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator. The USB has dedicated power rails allowing its use throughout the entire power range.

The major features are:

- Combined Rx and Tx FIFO size of 1 Kbit $\times 35$ with dynamic FIFO sizing
- Supports the session request protocol (SRP) and host negotiation protocol (HNP)
- 8 bidirectional endpoints
- 16 host channels with periodic OUT support
- Internal FS OTG PHY support
- External HS or HS OTG operation supporting ULPI in SDR mode. The OTG PHY is connected to the microcontroller ULPI port through 12 signals. It can be clocked using the 60 MHz output.
- Internal USB DMA
- HNP/SNP/IP inside (no need for any external resistor)
- for OTG/Host modes, a power switch is needed in case bus-powered devices are connected

### 3.35 Digital camera interface (DCMI)

The devices embed a camera interface that can connect with camera modules and CMOS sensors through an 8-bit to 14-bit parallel interface, to receive video data. The camera interface can sustain a data transfer rate up to $94.5 \mathrm{Mbyte} / \mathrm{s}$ (in 14-bit mode) at 54 MHz .

Its features:

- Programmable polarity for the input pixel clock and synchronization signals
- Parallel data communication can be 8-, 10-, 12- or 14-bit
- $\quad$ Supports 8-bit progressive video monochrome or raw bayer format, YCbCr 4:2:2 progressive video, RGB 565 progressive video or compressed data (like JPEG)
- Supports continuous mode or snapshot (a single frame) mode
- Capability to automatically crop the image black and white.

### 3.36 General-purpose input/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain, with or without pull-up or pull-down), as input (floating, with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current-capable and have speed selection to better manage internal noise, power consumption and electromagnetic emission.

The I/O configuration can be locked if needed by following a specific sequence in order to avoid spurious writing to the I/Os registers.

Fast I/O handling allowing maximum I/O toggling up to 90 MHz .

### 3.37 Analog-to-digital converters (ADCs)

Three 12-bit analog-to-digital converters are embedded and each ADC shares up to 16 external channels, performing conversions in the single-shot or scan mode. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold

The ADC can be served by the DMA controller. An analog watchdog feature makes possible a very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

To synchronize A/D conversion and timers, the ADCs could be triggered by any of TIM1, TIM2, TIM3, TIM4, TIM5, or TIM8 timer.

### 3.38 Temperature sensor

The temperature sensor has to generate a voltage that varies linearly with temperature. The conversion range is between 1.7 V and 3.6 V . The temperature sensor is internally connected to the same input channel as $\mathrm{V}_{\mathrm{BAT}}$, $\mathrm{ADC} 1 \_I N 18$, which is used to convert the sensor output voltage into a digital value. When the temperature sensor and $\mathrm{V}_{\text {BAT }}$ conversion are enabled at the same time, only $\mathrm{V}_{\mathrm{BAT}}$ conversion is performed.

As the offset of the temperature sensor varies from chip to chip due to process variation, the internal temperature sensor is mainly suitable for applications that detect temperature changes instead of absolute temperatures. If an accurate temperature reading is needed, then an external temperature sensor part should be used.

### 3.39 Digital-to-analog converter (DAC)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs.

This dual digital Interface supports the following features:

- two DAC converters: one for each output channel
- 8-bit or 10 -bit monotonic output
- left or right data alignment in 12-bit mode
- synchronized update capability
- noise-wave generation
- triangular-wave generation
- dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- external triggers for conversion
- input voltage reference $\mathrm{V}_{\mathrm{REF}}+$

Eight DAC trigger inputs are used in the device. The DAC channels are triggered through the timer update outputs that are also connected to different DMA streams.

### 3.40 Serial wire JTAG debug port (SWJ-DP)

The Arm SWJ-DP interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

Debug is performed using 2 pins only instead of 5 required by the JTAG (JTAG pins could be re-use as GPIO with alternate function): the JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

### 3.41 Embedded Trace Macrocell ${ }^{\text {TM }}$

The Arm Embedded Trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F446xx through a small number of ETM pins to an external hardware trace port analyser (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer that runs the debugger software. TPA hardware is commercially available from common development tool vendors.

The Embedded Trace Macrocell operates with third party debugger software tools.

Table 9. Legend/abbreviations used in the pinout table

| Name | Abbreviation | Definition |
| :---: | :---: | :---: |
| Pin name | Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name |  |
| Pin type | S | Supply pin |
|  | 1 | Input only pin |
|  | I/O | Input / output pin |
| I/O structure | FT | 5 V tolerant I/O |
|  | FTf | 5 V tolerant IO, I2C FM+ option |
|  | TTa | 3.3 V tolerant I/O directly connected to ADC |
|  | B | Dedicated BOOTO pin |
|  | RST | Bidirectional reset pin with weak pull-up resistor |
| Notes | Unless otherwise specified by a note, all I/Os are set as floating inputs during and after reset |  |
| Alternate functions | Functions selected through GPIOx_AFR registers |  |
| Additional functions | Functions directly selected/enabled through peripheral registers |  |

1. The grey color is used for reserved boundary addresses.

## 6 Electrical characteristics

### 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to $\mathrm{V}_{\text {SS }}$.

### 6.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on $100 \%$ of the devices with an ambient temperature at $T_{A}=25^{\circ} \mathrm{C}$ and $T_{A}=T_{A}$ max (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean $\pm 3 \sigma$ ).

### 6.1.2 Typical values

Unless otherwise specified, typical data are based on $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$ (for the $1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.6 \mathrm{~V}$ voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where $95 \%$ of the devices have an error less than or equal to the value indicated (mean $\pm 2 \sigma$ ).

### 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in Figure 16.

### 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in Figure 17.
Figure 16. Pin loading conditions $\quad$ Figure 17. Pin input voltage

### 6.1.6 Power supply scheme

Figure 18. Power supply scheme

1. $V_{D D A}$ and $V_{S S A}$ must be connected to $V_{D D}$ and $V_{S S}$, respectively.
2. $V_{\text {DDUŞB }}$ is a dedicated independent USB power supply for the on-chip full-speed OTG PHY module and associated DP/DM GPIOs. Its value is independent from the $V_{D D}$ and $V_{\text {DDA }}$ values, but must be the last supply to be provided and the first to disappear. If $V_{D D}$ is different from $V_{D D U S B}$ and only one on-chip OTG PHY is used, the second OTG PHY GPIOs (DP/DM) are still supplied at VDDUSB (3.3V).
3. $V_{\text {DDUSB }}$ is available only on WLCSP81, UFBGA144 and LQFP144 packages. For packages where $V_{\text {DDUSB }}$ pin is not available, it is internally connected to $V_{D D}$.
4. $\mathrm{V}_{\mathrm{CAP} \text { _ } 2}$ pad is not available on LQFP64.

Caution: Each power supply pair (e.g. $V_{D D} / V_{S S}, V_{D D A} / V_{S S A}$ ) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure good operation of the device. It is not recommended to remove filtering capacitors to reduce PCB size or cost. This might cause incorrect operation of the device.

### 6.1.7 Current consumption measurement

Figure 19. Current consumption measurement scheme

### 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in Table 13, Table 14, and Table 15 may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Device mission profile (application conditions) is compliant with JEDEC JESD47 Qualification Standard, extended mission profiles are available on demand.

Table 13. Voltage characteristics

| Symbol | Ratings | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{S S}$ | External main supply voltage (including $\mathrm{V}_{\mathrm{DDA}}, \mathrm{V}_{\mathrm{DD}}$, $V_{\text {DDUSB }}$ and $\left.V_{B A T}\right)^{(1)}$ | -0.3 | 4.0 | V |
| $\mathrm{V}_{\text {IN }}$ | Input voltage on FT \& FTf pins ${ }^{(2)}$ | $V_{S S}-0.3$ | $\mathrm{V}_{\mathrm{DD}}+4.0$ |  |
|  | Input voltage on TTa pins | $V_{S S}-0.3$ | 4.0 |  |
|  | Input voltage on any other pin | $\mathrm{V}_{\text {Ss }}-0.3$ | 4.0 |  |
|  | Input voltage on BOOT0 pin | $\mathrm{V}_{\mathrm{SS}}$ | 9.0 |  |
| $\left\|\Delta \mathrm{V}_{\text {DDx }}\right\|$ | Variations between different $\mathrm{V}_{\mathrm{DD}}$ power pins | - | 50 | mV |
| $\left\|\mathrm{V}_{\text {SSx }}-\mathrm{V}_{\text {SS }}\right\|$ | Variations between all the different ground pins | - | 50 |  |
| $V_{\text {ESD }}$ (HBM) | Electrostatic discharge voltage (human body model) | see Section 6.3.15 |  | - |

1. All main power $\left(\mathrm{V}_{\mathrm{DD}}, \mathrm{V}_{\mathrm{DDA}}\right)$ and ground $\left(\mathrm{V}_{\mathrm{SS}}, \mathrm{V}_{\mathrm{SSA}}\right)$ pins must always be connected to the external power supply, in the permitted range.
2. $\mathrm{V}_{\mathbb{I N}}$ maximum value must always be respected. Refer to Table 14 for the values of the maximum allowed injected current.

Table 14. Current characteristics

| Symbol | Ratings | Max. | Unit |
| :---: | :---: | :---: | :---: |
| $\Sigma l_{\text {VDD }}$ | Total current into sum of all $\mathrm{V}_{\mathrm{DD}}$ power lines (source) ${ }^{(1)}$ | 240 | mA |
| $\Sigma l_{\text {Vss }}$ | Total current out of sum of all $\mathrm{V}_{\text {SS }}$ ground lines (sink) ${ }^{(1)}$ | - 240 |  |
| $\Sigma \mathrm{IV}_{\text {DDUSB }}$ | Total current into $\mathrm{V}_{\text {DDUSB }}$ power line (source) | 25 |  |
| $I_{\text {VDD }}$ | Maximum current into each $\mathrm{V}_{\mathrm{DD}}$ power pin (source) ${ }^{(1)}$ | 100 |  |
| Ivss | Maximum current out of each $\mathrm{V}_{\text {SS }}$ ground pin (sink) ${ }^{(1)}$ | - 100 |  |
| 10 | Output current sunk by any I/O and control pin | 25 |  |
|  | Output current sourced by any I/Os and control pin | -25 |  |
| $\Sigma l_{10}$ | Total output current sunk by sum of all I/Os and control pins ${ }^{(2)}$ | 120 |  |
|  | Total output current sunk by sum of all USB I/Os | 25 |  |
|  | Total output current sourced by sum of all I/Os and control pins ${ }^{(2)}$ | -120 |  |
| $\mathrm{I}_{\mathrm{INJ}(\mathrm{PIN})}$ | Injected current on FT, FTf, RST and B pins | $-5 /+0^{(3)}$ |  |
|  | Injected current on TTa pins | $\pm 5^{(4)}$ |  |
| $\Sigma l_{\text {INJ(PIN })}$ | Total injected current (sum of all I/O and control pins) ${ }^{(5)}$ | $\pm 25$ |  |

1. All main power $\left(V_{D D}, V_{D D A}\right)$ and ground $\left(V_{S S}, V_{S S A}\right)$ pins must always be connected to the external power supply, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count LQFP packages.
3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. A positive injection is induced by $\mathrm{V}_{\text {IN }}>\mathrm{V}_{\text {DDA }}$ while a negative injection is induced by $\mathrm{V}_{\text {IN }}<\mathrm{V}_{\text {SS }}$. IINJ(PIN) must never be exceeded. Refer to Table 13 for the maximum allowed input voltage value.
5. When several inputs are submitted to a current injection, the maximum $\Sigma I_{I N J(P I N)}$ is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 15. Thermal characteristics

| Symbol | Ratings | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathrm{T}_{\text {STG }}$ | Storage temperature range | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{J}}$ | Maximum junction temperature | 125 | ${ }^{\circ} \mathrm{C}$ |

### 6.3 Operating conditions

### 6.3.1 General operating conditions

Table 16. General operating conditions

| Symbol | Parameter | Conditions ${ }^{(1)}$ |  | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\mathrm{HCLK}}$ | Internal AHB clock frequency | Power Scale 3 (VOS[1:0] bits in PWR_CR register = 0x01), <br> Regulator ON, over-drive OFF |  | 0 | - | 120 | MHz |
|  |  | Power Scale 2 (VOS[1:0] bits in PWR_CR register $=0 \times 10$ ), Regulator ON | Overdrive OFF | 0 | - | 144 |  |
|  |  |  | Overdrive ON |  | - | 168 |  |
|  |  | Power Scale 1 (VOS[1:0] bits | Overdrive OFF |  | - | 168 |  |
|  |  | Regulator ON | Overdrive ON |  | - | 180 |  |
| $\mathrm{f}_{\text {PCLK1 }}$ | Internal APB1 clock frequency | Over-drive OFF |  | 0 | - | 42 |  |
|  |  | Over-drive ON |  | 0 | - | 45 |  |
| $\mathrm{f}_{\text {PCLK2 }}$ | Internal APB2 clock frequency | Over-drive OFF |  | 0 | - | 84 |  |
|  |  | Over-drive ON |  | 0 | - | 90 |  |

Table 16. General operating conditions (continued)

1. The over-drive mode is not supported at the voltage ranges from 1.7 to 2.1 V .
2. $V_{D D} / V_{D D A}$ minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to Section 3.16.2: Internal reset OFF).
3. When the ADC is used, refer to Table 74: ADC characteristics.
4. If $\mathrm{V}_{\mathrm{REF}+}$ pin is present, it must respect the following condition: $\mathrm{V}_{\mathrm{DDA}}-\mathrm{V}_{\mathrm{REF}+}<1.2 \mathrm{~V}$.
5. It is recommended to power $V_{D D}$ and $V_{D D A}$ from the same source. A maximum difference of 300 mV between $\mathrm{V}_{\mathrm{DD}}$ and $V_{\text {DDA }}$ can be tolerated during power-up and power-down operation.
6. The over-drive mode is not supported when the internal regulator is OFF.
7. To sustain a voltage higher than VDD+0.3, the internal Pull-up and Pull-Down resistors must be disabled
8. If $T_{A}$ is lower, higher $P_{D}$ values are allowed as long as $T_{J}$ does not exceed $T_{J m a x}$.
9. In low power dissipation state, $T_{A}$ can be extended to this range as long as $T_{J}$ does not exceed $T_{J m a x}$.

Table 17. Limitations depending on the operating power supply range

| Operating power supply range | ADC operation | Maximum Flash memory access frequency with no wait states ( $\mathrm{f}_{\text {Flashmax }}$ ) | Maximum HCLK frequency vs Flash memory wait states (1)(2) | I/O operation | Possible Flash memory operations |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \mathrm{V}_{\mathrm{DD}}=1.7 \text { to } \\ 2.1 \mathrm{~V}^{(3)} \end{gathered}$ | Conversion time up to 1.2 Msps | $20 \mathrm{MHz}{ }^{(4)}$ | 168 MHz with 8 wait states and over-drive OFF | - No I/O compensation | 8-bit erase and program operations only |
| $\begin{gathered} \mathrm{V}_{\mathrm{DD}}=2.1 \text { to } \\ 2.4 \mathrm{~V} \end{gathered}$ | Conversion time up to 1.2 Msps | 22 MHz | 180 MHz with 8 wait states and over-drive ON | - No I/O compensation | 16-bit erase and program operations |
| $\begin{gathered} \mathrm{V}_{\mathrm{DD}}=2.4 \text { to } \\ 2.7 \mathrm{~V} \end{gathered}$ | Conversion time up to 2.4 Msps | 24 MHz | 180 MHz with 7 wait states and over-drive ON | - I/O compensation works | 16-bit erase and program operations |
| $\begin{gathered} \mathrm{V}_{\mathrm{DD}}=2.7 \text { to } \\ 3.6 \mathrm{~V}^{(5)} \end{gathered}$ | Conversion time up to 2.4 Msps | 30 MHz | 180 MHz with 5 wait states and over-drive ON | - I/O compensation works | 32-bit erase and program operations |

1. Applicable only when the code is executed from Flash memory. When the code is executed from RAM, no wait state is required.
2. Thanks to the ART accelerator and the 128-bit Flash memory, the number of wait states given here does not impact the execution speed from Flash memory since the ART accelerator enables to achieve a performance equivalent to 0 wait state program execution.
3. $V_{D D} / V_{D D A}$ minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to Section 3.16.2: Internal reset OFF).
4. Prefetch is not available.
5. The voltage range for USB full speed PHYs can drop down to 2.7 V . However the electrical characteristics of $D$ - and $D+$ pins are degraded between 2.7 and 3 V .

### 6.3.2 VCAP_1 / VCAP_2 external capacitor

Stabilization for the main regulator is achieved by connecting external capacitor $\mathrm{C}_{\text {EXT }}$ to the VCAP_1 and VCAP_2 pins. For packages supporting only $1 \mathrm{~V}_{\mathrm{CAP}}$ pin, the two $\mathrm{C}_{\text {EXT }}$ capacitors are replaced by a single capacitor. $\mathrm{C}_{\text {EXT }}$ is specified in Table 18.

Figure 20. External capacitor $\mathrm{C}_{\mathrm{EXT}}$

MS19044V2

1. Legend: $E S R$ is the equivalent series resistance.

Table 18. VCAP_1 / VCAP_2 operating conditions ${ }^{(1)}$

| Symbol | Parameter | Conditions |
| :---: | :--- | :---: |
| C $_{\text {EXT }}$ | Capacitance of external capacitor | $2.2 \mu \mathrm{~F}$ |
| ESR | ESR of external capacitor | $<2 \Omega$ |
| $\mathrm{C}_{\text {EXT }}$ | Capacitance of external capacitor with a single $\mathrm{V}_{\text {CAP }}$ pin available | $4.7 \mu \mathrm{~F}$ |
| ESR | ESR of external capacitor with a single $\mathrm{V}_{\text {CAP }}$ pin available | $<1 \Omega$ |

1. When bypassing the voltage regulator, the two $2.2 \mu \mathrm{~F} \mathrm{~V}_{\mathrm{CAP}}$ capacitors are not required and can be replaced by two 100 nF decoupling capacitors.

### 6.3.3 Operating conditions at power-up / power-down (regulator ON)

Subject to general operating conditions for $\mathrm{T}_{\mathrm{A}}$.
Table 19. Operating conditions at power-up/power-down (regulator ON)

| Symbol | Parameter | Min | Max |
| :---: | :--- | :---: | :---: |
| $\mathrm{t}_{\mathrm{VDD}}$ | $\mathrm{V}_{\mathrm{DD}}$ rise time rate | 20 | $\infty$ |
|  | $\mathrm{~V}_{\mathrm{DD}}$ fall time rate | 20 | $\infty$ |

### 6.3.4 Operating conditions at power-up / power-down (regulator OFF)

Subject to general operating conditions for $\mathrm{T}_{\mathrm{A}}$.
Table 20. Operating conditions at power-up / power-down (regulator OFF) ${ }^{(1)}$

| Symbol | Parameter | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $t_{V D D}$ | $V_{D D}$ rise time rate | Power-up | 20 | $\infty$ | $\mu \mathrm{s} / \mathrm{V}$ |
|  | $V_{\text {DD }}$ fall time rate | Power-down | 20 | $\infty$ |  |
| $\mathrm{t}_{\text {VCAP }}$ | $\mathrm{V}_{\text {CAP_1 }}$ and $\mathrm{V}_{\text {CAP_2 }}$ rise time rate | Power-up | 20 | $\infty$ |  |
|  | $\mathrm{V}_{\text {CAP_1 }}$ and $\mathrm{V}_{\text {CAP_2 }}$ fall time rate | Power-down | 20 | $\infty$ |  |

1. To reset the internal logic at power-down, a reset must be applied on pin PAO when $V_{D D}$ drops below 1.08 V .

### 6.3.5 Reset and power control block characteristics

The parameters given in Table 21 are derived from tests performed under ambient temperature and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16.

Table 21. reset and power control block characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{PVD}}$ | Programmable voltage detector level selection | PLS[2:0]=000 (rising edge) | 2.09 | 2.14 | 2.19 | V |
|  |  | PLS[2:0]=000 (falling edge) | 1.98 | 2.04 | 2.08 | V |
|  |  | PLS[2:0]=001 (rising edge) | 2.23 | 2.30 | 2.37 | V |
|  |  | PLS[2:0]=001 (falling edge) | 2.13 | 2.19 | 2.25 | V |
|  |  | PLS[2:0]=010 (rising edge) | 2.39 | 2.45 | 2.51 | V |
|  |  | PLS[2:0]=010 (falling edge) | 2.29 | 2.35 | 2.39 | V |
|  |  | PLS[2:0]=011 (rising edge) | 2.54 | 2.60 | 2.65 | V |
|  |  | PLS[2:0]=011 (falling edge) | 2.44 | 2.51 | 2.56 | V |

1. Guaranteed based on test during characterization.
2. The reset temporization is measured from the power-on (POR reset or wakeup from $\mathrm{V}_{\mathrm{BAT}}$ ) to the instant when first instruction is read by the user application code.

### 6.3.6 Over-drive switching characteristics

When the over-drive mode switches from enabled to disabled or disabled to enabled, the system clock is stalled during the internal voltage set-up.

The over-drive switching characteristics are given in Table 22. They are sbject to general operating conditions for $\mathrm{T}_{\mathrm{A}}$.

Table 22. Over-drive switching characteristics ${ }^{(1)}$

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |

|  |  | $\begin{gathered} \text { External HSE } \\ 50 \mathrm{MHz} \end{gathered}$ | - | 15 | - |  |

1. Guaranteed based on test during characterization.

### 6.3.7 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in Figure 19.
All the run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to CoreMark code.

## Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at $\mathrm{V}_{\mathrm{DD}}$ or $\mathrm{V}_{S S}$ (no load).
- All peripherals are disabled except if it is explicitly mentioned.
- The Flash memory access time is adjusted both to $\mathrm{f}_{\mathrm{HCLK}}$ frequency and $\mathrm{V}_{\mathrm{DD}}$ range (see Table 17).
- Regulator ON
- The voltage scaling and over-drive mode are adjusted to $f_{\text {HCLK }}$ frequency as follows:
- $\quad$ Scale 3 for $f_{\text {HCLK }} \leq 120 \mathrm{MHz}$
- Scale 2 for $120 \mathrm{MHz}<\mathrm{f}_{\mathrm{HCLK}} \leq 144 \mathrm{MHz}$
- Scale 1 for $144 \mathrm{MHz}<\mathrm{f}_{\text {HCLK }} \leq 180 \mathrm{MHz}$. The over-drive is only ON at 180 MHz .
- The system clock is HCLK, $\mathrm{f}_{\text {PCLK } 1}=\mathrm{f}_{\mathrm{HCLK}} / 4$, and $\mathrm{f}_{\text {PCLK2 }}=\mathrm{f}_{\text {HCLK }} / 2$.
- External clock frequency is 8 MHz and PLL is ON when $\mathrm{f}_{\mathrm{HCLK}}$ is higher than 16 MHz .
- Flash is enabled except if explicitly mentioned as disable.
- The maximum values are obtained for $\mathrm{V}_{\mathrm{DD}}=3.6 \mathrm{~V}$ and a maximum ambient temperature $\left(\mathrm{T}_{\mathrm{A}}\right)$, and the typical values for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$ unless otherwise specified.

## Additional current consumption

The MCU is placed under the following conditions:

- All I/O pins are configured in analog mode.
- The Flash memory access time is adjusted to fHCLK frequency.
- The voltage scaling is adjusted to fHCLK frequency as follows:
- $\quad$ Scale 3 for $\mathrm{f}_{\text {HCLK }} \leq 120 \mathrm{MHz}$,
- $\quad$ Scale 2 for $120 \mathrm{MHz}<\mathrm{f}_{\text {HCLK }} \leq 144 \mathrm{MHz}$
- $\quad$ Scale 1 for $144 \mathrm{MHz}<\mathrm{f}_{\text {HCLK }} \leq 180 \mathrm{MHz}$. The over-drive is only ON at 180 MHz .
- $\quad$ The system clock is HCLK, $\mathrm{f}_{\text {PCLK } 1}=\mathrm{f}_{\mathrm{HCLK}} / 4$, and $\mathrm{f}_{\mathrm{PCLK} 2}=\mathrm{f}_{\mathrm{HCLK}} / 2$.
- HSE crystal clock frequency is 8 MHz .
- Flash is enabled except if explicitly mentioned as disable.
- When the regulator is OFF, V12 is provided externally as described in Table 16: General operating conditions
- $\quad \mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.

1. When peripherals are enabled, the power consumption corresponding to the analog part of the peripherals (such as ADC, or DAC) is not included.

## I/O system current consumption

## The current consumption of the I/O system has two components: static and dynamic.

I/O static current consumption
All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in Table 56: I/O static characteristics.
For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

Caution: Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.
I/O dynamic current consumption
In addition to the internal peripheral current consumption (see Table 35), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$
I_{S W}=V_{D D} \times f_{S W} \times C
$$

where
$\mathrm{I}_{\mathrm{SW}}$ is the current sunk by a switching I/O to charge/discharge the capacitive load
$V_{D D}$ is the MCU supply voltage
$f_{S W}$ is the I/O switching frequency
$C$ is the total capacitance seen by the I/O pin: $C=C_{I N T}+C_{E X T}$
The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

Table 34. Switching output I/O current consumption ${ }^{(1)}$

| Symbol | Parameter | Conditions | I/O toggling frequency (fsw) | Typ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |

1. $\mathrm{C}_{\mathrm{S}}$ is the PCB board capacitance including the pad pin. $\mathrm{C}_{\mathrm{S}}=7 \mathrm{pF}$ (estimated value).
2. This test is performed by cutting the LQFP144 package pin (pad removal).

## On-chip peripheral current consumption

The MCU is placed under the following conditions:

- At startup, all I/O pins are in analog input configuration.
- All peripherals are disabled unless otherwise mentioned.
- $\quad$ HCLK is the system clock. $\mathrm{f}_{\text {PCLK } 1}=\mathrm{f}_{\text {HCLK }} / 4$, and $\mathrm{f}_{\text {PCLK2 }}=\mathrm{f}_{\text {HCLK }} / 2$.

The given value is calculated by measuring the difference of current consumption

- with all peripherals clocked off
- with only one peripheral clocked on
- $\quad \mathrm{f}_{\text {HCLK }}=180 \mathrm{MHz}$ (Scale1 + over-drive ON), $\mathrm{f}_{\text {HCLK }}=144 \mathrm{MHz}$ (Scale 2),
$\mathrm{f}_{\mathrm{HCLK}}=120 \mathrm{MHz}$ (Scale 3)"
- Ambient operating temperature is $25^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$.

Table 35. Peripheral current consumption

1. $\mathrm{N}=$ Number of strean enable (1..8)
2. To enable an I2S peripheral, first set the I2SMOD bit and then the I2SE bit in the SPI_I2SCFGR register.

### 6.3.8 Wakeup time from low-power modes

The wakeup times given in Table 36 are measured starting from the wakeup event trigger up to the first instruction executed by the CPU:

- For Stop or Sleep modes: the wakeup event is WFE.
- WKUP (PA0) pin is used to wakeup from Standby, Stop and Sleep modes.

All timings are derived from tests performed under ambient temperature and $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$.

Table 36. Low-power mode wakeup timings

| Symbol | Parameter | Conditions | Typ ${ }^{(1)}$ | Max ${ }^{(1)}$ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $t_{\text {WUSLEEP }}{ }^{(2)}$ | Wakeup from Sleep | - | 6 | 6 | CPU clock cycle |
| TWUSLEEPFDSM ${ }^{(1)}$ | Wakeup from Sleep with Flash memory in Deep power down mode | - | 33.5 | 50 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {WUSTOP }}{ }^{(2)}$ | Wakeup from Stop mode with MR/LP regulator in normal mode | Main regulator is ON | 12.8 | 15 |  |
|  |  | Main regulator is ON and Flash memory in Deep power down mode | 104.9 | 115 |  |
|  |  | Low power regulator is ON | 20.6 | 28 |  |
|  |  | Low power regulator is ON and Flash memory in Deep power down mode | 112.8 | 120 |  |
| $\mathrm{t}_{\text {WUSTOP }}{ }^{(2)}$ | Wakeup from Stop mode with MR/LP regulator in Under-drive mode | Main regulator in under-drive mode (Flash memory in Deep powerdown mode) | 110 | 140 |  |
|  |  | Low power regulator in under-drive mode <br> (Flash memory in Deep powerdown mode) | 114.4 | 128 |  |
| $\mathrm{t}_{\text {WUSTDBY }}{ }^{(2)(3)}$ | Wakeup from Standby mode | - | 325 | 400 |  |

1. Guaranteed based on test during characterization.
2. The wakeup times are measured from the wakeup event to the point in which the application code reads the first instruction.
3. $t_{\text {WUSTDBY }}$ maximum value is given at $-40^{\circ} \mathrm{C}$.

### 6.3.9 External clock source characteristics

High-speed external user clock generated from an external source
In bypass mode the HSE oscillator is switched off and the input pin is a standard I/O. The external clock signal has to respect the Table 56: I/O static characteristics. However, the recommended clock input waveform is shown in Figure 23.

The characteristics given in Table 37 result from tests performed using an high-speed external clock source, and under ambient temperature and supply voltage conditions summarized in Table 16.

Table 37. High-speed external user clock characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {HSE_ext }}$ | External user clock source frequency ${ }^{(1)}$ | - | 1 | - | 50 | MHz |
| $\mathrm{V}_{\text {HSEH }}$ | OSC_IN input pin high level voltage |  | $0.7 \mathrm{~V}_{\mathrm{DD}}$ | - | $V_{\text {DD }}$ | V |
| $\mathrm{V}_{\text {HSEL }}$ | OSC_IN input pin low level voltage |  | $\mathrm{V}_{S S}$ | - | $0.3 \mathrm{~V}_{\mathrm{DD}}$ |  |
| $\begin{aligned} & \mathrm{t}_{\mathrm{w}(\mathrm{HSE})} \\ & \mathrm{t}_{\mathrm{w}(\mathrm{HSE})} \end{aligned}$ | OSC_IN high or low time ${ }^{(1)}$ |  | 5 | - | - | ns |
| $\begin{aligned} & \left.\mathrm{t}_{\mathrm{r}(\mathrm{HSE})}\right) \\ & \mathrm{t}_{\mathrm{f}(\mathrm{HSE})} \end{aligned}$ | OSC_IN rise or fall time ${ }^{(1)}$ |  | - | - | 10 |  |
| $\mathrm{C}_{\text {in(HSE) }}$ | OSC_IN input capacitance ${ }^{(1)}$ | - | - | 5 | - | pF |
| DuCy ${ }_{\text {(HSE) }}$ | Duty cycle | - | 45 | - | 55 | \% |
| l L | OSC_IN Input leakage current | $\begin{gathered} \mathrm{V}_{\mathrm{SS}} \leq \mathrm{V}_{I N} \leq \\ \mathrm{V}_{\mathrm{DD}} \end{gathered}$ | - | - | $\pm 1$ | $\mu \mathrm{A}$ |

1. Guaranteed by design.

## Low-speed external user clock generated from an external source

In bypass mode the LSE oscillator is switched off and the input pin is a standard I/O. The external clock signal has to respect the Table 56: I/O static characteristics. However, the recommended clock input waveform is shown in Figure 24.
The characteristics given in Table 38 result from tests performed using an low-speed external clock source, and under ambient temperature and supply voltage conditions summarized in Table 16.

Table 38. Low-speed external user clock characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| flSE_ext | User External clock source frequency ${ }^{(1)}$ | - | - | 32.768 | 1000 | kHz |
| $\mathrm{V}_{\text {LSEH }}$ | OSC32_IN input pin high level voltage |  | $0.7 \mathrm{~V}_{\mathrm{DD}}$ | - | $V_{D D}$ | V |
| $V_{\text {LSEL }}$ | OSC32_IN input pin low level voltage |  | $\mathrm{V}_{\mathrm{SS}}$ | - | $0.3 \mathrm{~V}_{\mathrm{DD}}$ |  |
| $\begin{gathered} \left.\mathrm{t}_{\mathrm{w}(\mathrm{LSE})} \mathrm{t}_{\mathrm{f}(\mathrm{LSE})}\right) \end{gathered}$ | OSC32_IN high or low time ${ }^{(1)}$ |  | 450 | - | - | ns |
| $\begin{aligned} & \left.\mathrm{t}_{\mathrm{r}(\mathrm{LSE})}\right) \\ & \mathrm{t}_{\mathrm{f}(\mathrm{LSE})} \end{aligned}$ | OSC32_IN rise or fall time ${ }^{(1)}$ |  | - | - | 200 |  |
| $\mathrm{C}_{\text {in(LSE) }}$ | OSC32_IN input capacitance ${ }^{(1)}$ | - | - | 5 | - | pF |

[^1]Figure 23. High-speed external clock source AC timing diagram

Figure 24. Low-speed external clock source AC timing diagram

High-speed external clock generated from a crystal/ceramic resonator
The high-speed external (HSE) clock can be supplied with a 4 to 26 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in Table 39. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 39. HSE 4-26 MHz oscillator characteristics ${ }^{(1)}$

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {OSC_IN }}$ | Oscillator frequency | - | 4 | - | 26 | MHz |
| $\mathrm{R}_{\mathrm{F}}$ | Feedback resistor | - | - | 200 | - | k $\Omega$ |
| IDD | HSE current consumption | $\begin{gathered} \mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}, \\ \mathrm{ESR}=30 \Omega, \\ \mathrm{C}_{\mathrm{L}}=5 \mathrm{pF} @ 25 \mathrm{MHz} \end{gathered}$ | - | 450 | - | $\mu \mathrm{A}$ |
|  |  | $\begin{gathered} \mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}, \\ \mathrm{ESR}=30 \Omega, \\ \mathrm{C}_{\mathrm{L}}=10 \mathrm{pF} @ 25 \mathrm{MHz} \end{gathered}$ | - | 530 | - |  |
| $\mathrm{ACC}_{\text {HSE }}{ }^{(2)}$ | HSE accuracy | - | -500 | - | 500 | ppm |
| $\mathrm{G}_{\mathrm{m}}$ crit_max | Maximum critical crystal $\mathrm{gm}_{\mathrm{m}}$ | Startup | - | - | 1 | $\mathrm{mA} / \mathrm{V}$ |
| $\mathrm{t}_{\text {SU(HSE }}{ }^{(3)}$ | Startup time | $V_{D D}$ is stabilized | - | 2 | - | ms |

1. Guaranteed by design.
2. This parameter depends on the crystal used in the application. The minimum and maximum values must be respected to comply with USB standard specifications.
3. $t_{S U(H S E)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is Guaranteed based on test during characterization. It is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For $\mathrm{C}_{\mathrm{L} 1}$ and $\mathrm{C}_{\mathrm{L} 2}$, it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see Figure 25). $\mathrm{C}_{\mathrm{L} 1}$ and $\mathrm{C}_{\mathrm{L} 2}$ are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of $C_{L 1}$ and $C_{L 2}$. PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing $\mathrm{C}_{\mathrm{L} 1}$ and $\mathrm{C}_{\mathrm{L} 2}$.

Note: $\quad$ For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website www.st.com.

Figure 25. Typical application with an 8 MHz crystal

Resonator with integrated capacitors

1. $R_{E X T}$ value depends on the crystal characteristics.

## Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in Table 40. In the application, the resonator and the load capacitors have to be placed as close as
possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 40. LSE oscillator characteristics ( $\left.\mathrm{f}_{\text {LSE }}=32.768 \mathrm{kHz}\right)^{(1)}$

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{\mathrm{F}}$ | Feedback resistor | - | - | 18.4 | - | $\mathrm{M} \Omega$ |
| $\mathrm{I}_{\mathrm{DD}}$ | LSE current consumption | - | - | - | 1 | $\mu \mathrm{~A}$ |
| $\mathrm{ACC}_{\text {LSE }}{ }^{(2)}$ | LSE accuracy | - | -500 | - | 500 | ppm |
| $\mathrm{G}_{\mathrm{m}}$ Crit_max $^{2}$Maximum critical crystal <br> $\mathrm{g}_{\mathrm{m}}$ | Startup low-power mode | - | - | 0.56 | $\mu \mathrm{~A} / \mathrm{V}$ |  |
|  | $\mathrm{t}_{\mathrm{SU}(\text { LSE })}{ }^{(3)}$ | Startup time high-drive mode | - | - |  |  |

1. Guaranteed by design.
2. This parameter depends on the crystal used in the application. Refer to application note AN2867.
3. $t_{\text {SU(LSE) }}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is guaranteed based on test during characterization. It is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Note: $\quad$ For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website www.st.com.

1. Take care of using the appropriate division factor $M$ to have the specified PLL input clock values.
2. Guaranteed by design.
3. Value given with main PLL running.
4. Guaranteed based on test during characterization.

### 6.3.12 PLL spread spectrum clock generation (SSCG) characteristics

The spread spectrum clock generation (SSCG) feature reduces electromagnetic interferences (see Table 52: EMI characteristics). It is available only on the main PLL.

Table 46. SSCG parameters constraint

| Symbol | Parameter | Min | Typ | Max $^{(1)}$ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {Mod }}$ | Modulation frequency | - | - | 10 | KHz |
| md | Peak modulation depth | 0.25 | - | 2 | $\%$ |
| MODEPER * INCSTEP | - | - | - | $2^{15}-1$ | - |

1. Guaranteed by design.

## Equation 1

The frequency modulation period (MODEPER) is given by the equation below:

$$
\text { MODEPER }=\operatorname{round}\left[\mathrm{f}_{\text {PLL_IN }} /\left(4 \times \mathrm{f}_{\text {Mod }}\right)\right]
$$

$\mathrm{f}_{\mathrm{PLL} \_\mathrm{N}}$ and $\mathrm{f}_{\text {Mod }}$ must be expressed in Hz .
As an example:
If $\mathrm{f}_{\mathrm{PLL}} \mathrm{IN}=1 \mathrm{MHz}$, and $\mathrm{f}_{\mathrm{MOD}}=1 \mathrm{kHz}$, the modulation depth (MODEPER) is given by equation 1 :

$$
\operatorname{MODEPER}=\operatorname{round}\left[10^{6} /\left(4 \times 10^{3}\right)\right]=250
$$

## Equation 2

The increment step (INCSTEP) can be calculated with Equation 2:

$$
\operatorname{INCSTEP}=\operatorname{round}\left[\left(\left(2^{15}-1\right) \times \mathrm{md} \times \mathrm{PLLN}\right) /(100 \times 5 \times \mathrm{MODEPER})\right]
$$

$\mathrm{f}_{\text {VCO_out }}$ must be expressed in MHz .
With a modulation depth $(\mathrm{md})= \pm 2 \%$ ( $4 \%$ peak to peak), and PLLN $=240$ (in MHz):

$$
\operatorname{INCSTEP}=\operatorname{round}\left[\left(\left(2^{15}-1\right) \times 2 \times 240\right) /(100 \times 5 \times 250)\right]=126 \mathrm{md}(\text { quantitazed }) \%
$$

An amplitude quantization error may be generated because the linear modulation profile is obtained by taking the quantized values (rounded to the nearest integer) of MODPER and INCSTEP. As a result, the achieved modulation depth is quantized. The percentage quantized modulation depth is given by the following formula:

$$
\mathrm{md}_{\text {quantized }} \%=(\text { MODEPER } \times \operatorname{INCSTEP} \times 100 \times 5) /\left(\left(2^{15}-1\right) \times \text { PLLN }\right)
$$

As a result:

$$
\mathrm{md}_{\text {quantized }} \%=(250 \times 126 \times 100 \times 5) /\left(\left(2^{15}-1\right) \times 240\right)=2.002 \%(\text { peak })
$$

Figure 29 and Figure 30 show the main PLL output clock waveforms in center spread and down spread modes, where:

F0 is $f_{\text {PLL_OUT }}$ nominal.
$T_{\text {mode }}$ is the modulation period.
md is the modulation depth.

Figure 29. PLL output clock waveforms in center spread mode

Figure 30. PLL output clock waveforms in down spread mode

### 6.3.13 Memory characteristics

## Flash memory

The characteristics are given at $\mathrm{T}_{\mathrm{A}}=-40$ to $105^{\circ} \mathrm{C}$ unless otherwise specified.
The devices are shipped to customers with the Flash memory erased.
Table 47. Flash memory characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $I_{\text {D }}$ | Supply current | Write / Erase 8-bit mode, $\mathrm{V}_{\mathrm{DD}}=1.7 \mathrm{~V}$ | - | 5 | - | mA |
|  |  | Write / Erase 16-bit mode, $\mathrm{V}_{\mathrm{DD}}=2.1 \mathrm{~V}$ | - | 8 | - |  |
|  |  | Write / Erase 32-bit mode, $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$ | - | 12 | - |  |

Table 48. Flash memory programming

|  |  | 10 kcycles $^{(2)}$ at $\mathrm{T}_{\mathrm{A}}=55^{\circ} \mathrm{C}$ | 20 |  |

1. Guaranteed based on test during characterization.
2. Cycling performed over the whole temperature range.

### 6.3.14 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

## Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling two LEDs through I/O ports). the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs.

- Electrostatic discharge (ESD) (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- FTB: A burst of fast transient voltage (positive and negative) is applied to $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{SS}}$ through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset enables resuming normal operation.
The test results are given in Table 51. They are based on the EMS levels and classes defined in AN1709 EMC design guide for STM8, STM32 and Legacy MCUs, available on www.st.com.

Table 51. EMS characteristics

| Symbol | Parameter | Conditions | Level/Class |
| :--- | :--- | :--- | :---: |
| $\mathrm{V}_{\text {FESD }}$ | Voltage limits to be applied on any $\mathrm{I} / \mathrm{O}$ pin <br> to induce a functional disturbance | $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$, LQFP144, <br> $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{f}_{\mathrm{HCLK}}=168 \mathrm{MHz}$, <br> conforms to IEC 61000-4-2 | 2 B |
| $\mathrm{~V}_{\mathrm{EFTB}}$ | Fast transient voltage burst limits to be <br> applied through 100 pF on $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{SS}}$ <br> pins to induce a functional disturbance | $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$, LQFP144, <br> $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{f}_{\mathrm{HCLK}}=168 \mathrm{MHz}$, <br> conforms to IEC 61000-4-2 | 4 B |

## Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. Good EMC performance is highly dependent on the user application and the software in particular. It is therefore recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for the application.

## Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

## Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see AN1015 Software techniques for improving microcontrollers EMC performance, available on www.st.com).

## Electromagnetic interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application, executing EEMBC code, is running. This emission test is compliant with SAE IEC61967-2 standard which specifies the test board and the pin loading.

Table 52. EMI characteristics

| Symbol | Parameter | Conditions | Monitored | Max vs. [ $\mathrm{f}_{\mathrm{HSE}} / \mathrm{f}_{\mathrm{CPU}}$ ] | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | 8/180 MHz |  |
| $\mathrm{S}_{\text {EMI }}$ | Peak level | $V_{D D}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, LQFP144 package, conforming to SAE J1752/3 EEMBC, ART ON, all peripheral clocks enabled, clock dithering disabled. | 0.1 to 30 MHz | 11 | $\mathrm{dB} \mu \mathrm{V}$ |
|  |  |  | 30 to 130 MHz | 10 |  |
|  |  |  | 130 MHz to 1GHz | 11 |  |
|  |  |  | SAE EMI Level | 3 | - |
|  |  | $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, LQFP144 package, conforming to SAE J1752/3 EEMBC, ART ON, all peripheral clocks enabled, clock dithering enabled | 0.1 to 30 MHz | 24 | $\mathrm{dB} \mu \mathrm{V}$ |
|  |  |  | 30 to 130 MHz | 25 |  |
|  |  |  | 130 MHz to 1GHz | 20 |  |
|  |  |  | SAE EMI level | 4 | - |

### 6.3.15 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

## Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts $\times(n+1)$ supply pins). This test conforms to the ANSI/JEDEC standard.

Table 53. ESD absolute maximum ratings

| Symbol | Ratings | Conditions | Class | Maximum value ${ }^{(1)}$ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {ESD }}$ (HBM) | Electrostatic discharge voltage (human body model) | $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$ conforming to ANSI/JEDEC JS-001 | 2 | 2000 | V |
| $\mathrm{V}_{\text {ESD (CDM) }}$ | Electrostatic discharge voltage (charge device model) | $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$ conforming to ANSI/ESD STM5.3.1, LQFP64, LQFP100, WLCSP81 packages | C4 | 500 |  |
|  |  | $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$ conforming to ANSI/ESD STM5.3.1, LQFP144, UFBGA144 (7x7), UFBGA144 (10 x 10) packages | C3 | 250 |  |

1. Guaranteed based on test during characterization.

## Static latchup

Two complementary static tests are required on six parts to assess the latchup performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latchup standard.
Table 54. Electrical sensitivities

| Symbol | Parameter | Conditions | Class |
| :---: | :--- | :--- | :---: |
| LU | Static latch-up class | $\mathrm{T}_{\mathrm{A}}=+105^{\circ} \mathrm{C}$ conforming to JESD78A | II level A |

### 6.3.16 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below $\mathrm{V}_{\mathrm{SS}}$ or above $\mathrm{V}_{\mathrm{DD}}$ (for standard, 3 V -capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

## Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (>5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of $5 \mu \mathrm{~A} /+0 \mu \mathrm{~A}$ range), or other functional failure (for example reset, oscillator frequency deviation).
Negative induced leakage current is caused by negative injection and positive induced leakage current by positive injection.

The test results are given in Table 55.
Table 55. I/O current injection susceptibility ${ }^{(1)}$

| Symbol | Description | Functional susceptibility |  | Unit |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Negative injection | Positive injection |  |
| $\mathrm{I}_{\mathrm{INJ}}$ | Injected current on BOOT0 pin | -0 | NA | mA |
|  | Injected current on NRST pin | -0 | NA |  |
|  | Injected current on PE2, PE3,PE4, PE5, PE6, PC13, PC14, PF10, PH0, PH1, NRST, PC0, PC1, PC2, PC3, PG15, PB3, PB4, PB5, PB6, PB7, PB8, PB9, PE0, PE1 | -0 | NA |  |
|  | Injected current on any other FT and FTf pins | -5 | NA |  |
|  | Injected current on any other pins | -5 | +5 |  |

1. $N A=$ not applicable.

Note: It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.

### 6.3.17 I/O port characteristics

## General input/output characteristics

Unless otherwise specified, the parameters given in Table 56 are derived from tests performed under the conditions summarized in Table 16. All I/Os are CMOS and TTL compliant.

Table 56. I/O static characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\mathrm{C}_{10}{ }^{(7)}$ | I/O pin capacitance |  | - | - | 5 | - | pF |

1. Guaranteed by design.
2. Tested in production.
3. Leakage could be higher than the maximum value, if negative current is injected on adjacent pins, Refer to Table 55: I/O current injection susceptibility
4. To sustain a voltage higher than VDD +0.3 V , the internal pull-up/pull-down resistors must be disabled. Leakage could be higher than the maximum value, if negative current is injected on adjacent pins.Refer to Table 55: I/O current injection susceptibility
5. Pull-up resistors are designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimum ( $\sim 10 \%$ order).
6. Pull-down resistors are designed with a true resistance in series with a switchable NMOS. This NMOS contribution to the series resistance is minimum ( $\sim 10 \%$ order).
7. Hysteresis voltage between Schmitt trigger switching levels. Guaranteed based on test during characterization.

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements for FT I/Os is shown in Figure 31.

Figure 31. FT I/O input characteristics

## Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to $\pm 8 \mathrm{~mA}$, and sink or source up to $\pm 20 \mathrm{~mA}$ (with a relaxed $\mathrm{V}_{\mathrm{OL}} / \mathrm{V}_{\mathrm{OH}}$ ) except PC13, PC14 and PC15 which can sink or source up to $\pm 3 \mathrm{~mA}$. When using the PC13 to PC15 GPIOs in output mode, the speed should not exceed 2 MHz with a maximum load of 30 pF .
In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in Section 6.2. In particular:

- The sum of the currents sourced by all the I/Os on $V_{D D}$, plus the maximum Run consumption of the MCU sourced on $V_{D D}$, cannot exceed the absolute maximum rating $\Sigma \mathrm{I}_{\mathrm{VDD}}$ (see Table 14).
- The sum of the currents sunk by all the $I / O s$ on $V_{S S}$ plus the maximum Run consumption of the MCU sunk on $V_{S S}$ cannot exceed the absolute maximum rating $\Sigma l_{\text {VSS }}$ (see Table 14).

## Output voltage levels

Unless otherwise specified, the parameters given in Table 57 are derived from tests performed under ambient temperature and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16. All I/Os are CMOS and TTL compliant.

Table 57. Output voltage characteristics

| Symbol | Parameter | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{OL}}{ }^{(1)}$ | Output low level voltage for an I/O pin | $\begin{gathered} \text { CMOS port }{ }^{(2)} \\ \mathrm{I}_{\mathrm{IO}}=+8 \mathrm{~mA} \\ 2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.6 \mathrm{~V} \end{gathered}$ | - | 0.4 | V |
| $\mathrm{V}_{\mathrm{OH}}{ }^{(3)}$ | Output high level voltage for an I/O pin |  | $\mathrm{V}_{\mathrm{DD}}=0.4$ | - |  |
| $V_{O L}{ }^{(1)}$ | Output low level voltage for an I/O pin | $\begin{gathered} \text { TTL port }^{(2)} \\ \mathrm{I}_{\mathrm{IO}}=+8 \mathrm{~mA} \\ 2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.6 \mathrm{~V} \end{gathered}$ | - | 0.4 | V |
| $\mathrm{V}_{\mathrm{OH}}{ }^{(3)}$ | Output high level voltage for an I/O pin |  | 2.4 | - |  |
| $\mathrm{V}_{\mathrm{OL}}{ }^{(1)}$ | Output low level voltage for an I/O pin | $\begin{gathered} \mathrm{I}_{\mathrm{O}}=+20 \mathrm{~mA} \\ 2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.6 \mathrm{~V} \end{gathered}$ | - | $1.3{ }^{(4)}$ | V |
| $\mathrm{V}_{\mathrm{OH}}{ }^{(3)}$ | Output high level voltage for an I/O pin |  | $\mathrm{V}_{\mathrm{DD}}-1.3^{(4)}$ |  |  |
| $\mathrm{V}_{\mathrm{OL}}{ }^{(1)}$ | Output low level voltage for an I/O pin | $\begin{gathered} \mathrm{I}_{\mathrm{IO}}=+6 \mathrm{~mA} \\ 1.8 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.6 \mathrm{~V} \end{gathered}$ | - | $0.4{ }^{(4)}$ | V |
| $\mathrm{V}_{\mathrm{OH}}{ }^{(3)}$ | Output high level voltage for an I/O pin |  | $\mathrm{V}_{\mathrm{DD}}-0.4^{(4)}$ |  |  |
| $\mathrm{V}_{\mathrm{OL}}{ }^{(1)}$ | Output low level voltage for an I/O pin | $\begin{gathered} \mathrm{I}_{\mathrm{IO}}=+4 \mathrm{~mA} \\ 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.6 \mathrm{~V} \end{gathered}$ | - | $0.4{ }^{(5)}$ | V |
| $\mathrm{V}_{\mathrm{OH}}{ }^{(3)}$ | Output high level voltage for an I/O pin |  | $\mathrm{V}_{\mathrm{DD}}-0.4{ }^{(5)}$ | - |  |

1. The $I_{\mathrm{j}}$ current sunk by the device must always respect the absolute maximum rating specified in Table 14. and the sum of $\mathrm{I}_{\mathrm{IO}}$ (I/O ports and control pins) must not exceed $\mathrm{I}_{\mathrm{VSS}}$.
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. The $\mathrm{I}_{\mathrm{O}}$ current sourced by the device must always respect the absolute maximum rating specified in Table 14 and the sum of $\mathrm{I}_{\mathrm{IO}}$ (I/O ports and control pins) must not exceed $\mathrm{I}_{\mathrm{VDD}}$.
4. Based on characterization data.
5. Guaranteed by design.

## Input/output AC characteristics

The definition and values of input/output AC characteristics are given in Figure 32 and Table 58, respectively.
Unless otherwise specified, the parameters given in Table 58 are derived from tests performed under the ambient temperature and $V_{D D}$ supply voltage conditions summarized in Table 16.

Table 58. I/O AC characteristics ${ }^{(1)(2)}$

| - | $t_{\text {EXTIpw }}$ | Pulse width of external signals detected by the EXTI controller | - | 10 | - | - | ns |

1. Guaranteed by design.
2. The I/O speed is configured using the OSPEEDRy[1:0] bits. Refer to the STM32F4xx reference manual for a description of the GPIOx_SPEEDR GPIO port output speed register.
3. The maximum frequency is defined in Figure 32.
4. For maximum frequencies above 50 MHz and $\mathrm{V}_{\mathrm{DD}}>2.4 \mathrm{~V}$, the compensation cell should be used.

Figure 32. I/O AC characteristics definition

### 6.3.18 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor, R RU (see Table 56).
Unless otherwise specified, the parameters given in Table 59 are derived from tests performed under the ambient temperature and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16.

Table 59. NRST pin characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{\text {PU }}$ | Weak pull-up equivalent resistor ${ }^{(1)}$ | $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\mathrm{SS}}$ | 30 | 40 | 50 | $\mathrm{k} \Omega$ |
| $\mathrm{V}_{\mathrm{F}(\mathrm{NRST})}{ }^{(2)}$ | NRST Input filtered pulse | - | - | - | 100 | ns |
| $\mathrm{~V}_{\text {NF(NRST) }}{ }^{(2)}$ | NRST Input not filtered pulse | $\mathrm{V}_{\mathrm{DD}}>2.7 \mathrm{~V}$ | 300 | - | - | ns |
| $\mathrm{T}_{\text {NRST_OUT }}$ | Generated reset pulse duration | Internal Reset source | 20 | - | - | $\mu \mathrm{s}$ |

1. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum ( $\sim 10 \%$ order).
2. Guaranteed by design.

Figure 33. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the $\mathrm{V}_{\text {IL(NRST) }}$ max level specified in Table 59. Otherwise the reset is not taken into account by the device.
3. The external capacitor on NRST must be placed as close as possible to the device.

### 6.3.19 TIM timer characteristics

The parameters given in Table 60 are guaranteed by design.
Refer to Section 6.3.17 for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 60. TIMx characteristics ${ }^{(1)(2)}$

| Symbol | Parameter | Conditions ${ }^{(3)}$ | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\text {res (TIM) }}$ | Timer resolution time | AHB/APBx prescaler=1 or 2 or $4, \mathrm{f}_{\text {TIMxCLK }}=180 \mathrm{MHz}$ | 1 | - | ${ }^{\text {t }}$ IMx $\times$ CLK |
|  |  | $\begin{aligned} & \text { AHB/APBx prescaler>4, } \\ & \mathrm{f}_{\mathrm{TIMxCLK}}=90 \mathrm{MHz} \end{aligned}$ | 1 | - | ${ }^{\text {t }}$ IMxCLK |
| $\mathrm{f}_{\mathrm{EXT}}$ | Timer external clock frequency on CH 1 to CH 4 | $\mathrm{f}_{\text {TIM } \mathrm{MCLK}}=180 \mathrm{MHz}$ | 0 | $\mathrm{f}_{\text {TIMXCLK }} / 2$ | MHz |
| $\mathrm{Res}_{\text {TIM }}$ | Timer resolution |  | - | 16/32 | bit |
| $\mathrm{t}_{\text {MAX_COUNT }}$ | Maximum possible count with 32-bit counter | - | - | $65536 \times 65536$ | ${ }^{\text {t }}$ IMx ${ }^{\text {cLK }}$ |

1. TIMx is used as a general term to refer to the TIM1 to TIM12 timers.
2. Guaranteed by design.
3. The maximum timer frequency on APB1 or APB2 is up to 180 MHz , by setting the TIMPRE bit in the RCC_DCKCFGR register, if APBx prescaler is 1 or 2 or 4 , then TIMxCLK $=\mathrm{HCKL}$, otherwise TIMxCLK $=4 x$ PCLKx.

### 6.3.20 Communications interfaces

## $I^{2}$ C interface characteristics

The $I^{2} \mathrm{C}$ interface meets the requirements of the standard $\mathrm{I}^{2} \mathrm{C}$ communication protocol with the following restrictions: the I/O pins SDA and SCL too are mapped as not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and $V_{D D}$ is disabled, but is still present.

The $\mathrm{I}^{2} \mathrm{C}$ characteristics are described in Table 61. Refer also to Section 6.3.17 for more details on the input/output alternate function characteristics (SDA and SCL).

Table 61. $\mathrm{I}^{2} \mathrm{C}$ characteristics

| Symbol | Parameter | Standard mode$I^{2} C^{(1)(2)}$ |  | Fast mode $\mathrm{I}^{2} \mathrm{C}^{(1)(2)}$ |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Max | Min | Max |  |
| $\mathrm{t}_{\mathrm{w} \text { (SCLL) }}$ | SCL clock low time | 4.7 | - | 1.3 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {w(SCLH }}$ | SCL clock high time | 4.0 | - | 0.6 | - |  |
| $\mathrm{t}_{\text {su(SDA) }}$ | SDA setup time | 250 | - | 100 | - | ns |
| $\mathrm{th}_{\text {(SDA }}$ | SDA data hold time | - | $3450{ }^{(3)}$ | - | 900(4) |  |
| $\mathrm{t}_{\mathrm{v} \text { (SDA, ACK) }}$ | Data, ACK valid time | - | 3.45 | - | 0.9 |  |
| $\begin{aligned} & \mathrm{t}_{\mathrm{r}(\mathrm{SDA})} \\ & \left.\mathrm{t}_{\mathrm{r}(\mathrm{SCL}}\right) \end{aligned}$ | SDA and SCL rise time | - | 1000 | - | 300 |  |
| $\begin{aligned} & \mathrm{t}_{\mathrm{f}(\mathrm{SDA})} \\ & \mathrm{t}_{\mathrm{f}(\mathrm{SCL})} \end{aligned}$ | SDA and SCL fall time | - | 300 | - | 300 |  |
| $\mathrm{th}_{\text {(STA) }}$ | Start condition hold time | 4.0 | - | 0.6 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {su(STA) }}$ | Repeated Start condition setup time | 4.7 | - | 0.6 | - |  |
| $\mathrm{t}_{\text {su(STO) }}$ | Stop condition setup time | 4.0 | - | 0.6 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{w} \text { (STO:STA) }}$ | Stop to Start condition time (bus free) | 4.7 | - | 1.3 | - | $\mu \mathrm{s}$ |
| $t_{\text {SP }}$ | Pulse width of the spikes that are suppressed by the analog filter for standard and fast mode | - | - | 0.05 | $0.09^{(5)}$ | $\mu \mathrm{s}$ |
| $\mathrm{C}_{\mathrm{b}}$ | Capacitive load for each bus line | - | 400 | - | 400 | pF |

1. Guaranteed based on test during characterization.
2. $\mathrm{f}_{\mathrm{PCLK} 1}$ must be at least 2 MHz to achieve standard mode $\mathrm{I}^{2} \mathrm{C}$ frequencies. It must be at least 4 MHz to achieve fast mode $\mathrm{I}^{2} \mathrm{C}$ frequencies, and a multiple of 10 MHz to reach the 400 kHz maximum $\mathrm{I}^{2} \mathrm{C}$ fast mode clock.
3. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.
4. The maximum data hold time has only to be met if the interface does not stretch the low period of SCL signal.
5. The minimum width of the spikes filtered by the analog filter is above $t_{\mathrm{SP}}(\mathrm{max})$.

Figure $34.1^{2} \mathrm{C}$ bus AC waveforms and measurement circuit

1. $R_{S}=$ series protection resistor.
2. $R_{P}=$ external pull-up resistor.
3. $V_{D D \_I 2 C}$ is the I2C bus power supply.

## FMPI $^{2} \mathrm{C}$ characteristics

The FMPI2C characteristics are described in Table 62.
Refer also to Section 6.3.17 for more details on the input/output alternate function characteristics (SDA and SCL).

Table 62. FMPI $^{2} \mathrm{C}$ characteristics ${ }^{(1)}$

| - | Parameter | Standard mode |  | Fast mode |  | Fast+ mode |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Max | Min | Max | Min | Max |  |
| $\mathrm{f}_{\text {FMPI2CC }}$ | $\mathrm{F}_{\text {MPI2CCLK }}$ frequency | 2 | - | 8 | - | $\begin{gathered} 17 \\ 16^{(2)} \end{gathered}$ | - |  |
| $\mathrm{t}_{\mathrm{w} \text { (SCLL) }}$ | SCL clock low time | 4.7 | - | 1.3 | - | 0.5 | - |  |
| $\mathrm{t}_{\text {w(SCLH }}$ | SCL clock high time | 4.0 | - | 0.6 | - | 0.26 | - |  |
| $\mathrm{t}_{\text {su(SDA) }}$ | SDA setup time | 0.25 | - | 0.10 | - | 0.05 | - |  |
| $\mathrm{t}_{\mathrm{H} \text { (SDA) }}$ | SDA data hold time | 0 | - | 0 | - | 0 | - |  |

1. Guaranteed based on test during characterization.
2. When $\operatorname{tr}(\mathrm{SDA}, \mathrm{SCL})<=110 \mathrm{~ns}$.
3. Can be limited. Maximum supported value can be retrieved by referring to the following formulas:
$\mathrm{t}_{\mathrm{r}(\mathrm{SDA} / \mathrm{SCL})}=0.8473 \times \mathrm{R}_{\mathrm{p}} \times \mathrm{C}_{\text {load }}$
$R_{p(\text { min })}=\left(V_{D D}-V_{O L(\text { max })}\right) / I_{\text {loL(max })}$

Figure 35. $\mathrm{FMPI}^{2} \mathrm{C}$ timing diagram and measurement circuit

## SPI interface characteristics

Unless otherwise specified, the parameters given in Table 63 for SPI are derived from tests performed under the ambient temperature, $f_{P C L K x}$ frequency and $V_{D D}$ supply voltage conditions summarized in Table 16, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load $\mathrm{C}=30 \mathrm{pF}$
- Measurement points are done at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$

Refer to Section 6.3.17 for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

## QSPI interface characteristics

Unless otherwise specified, the parameters given in Table 64 for QSPI are derived from tests performed under the ambient temperature, $\mathrm{f}_{\mathrm{AHB}}$ frequency and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load $\mathrm{C}=20 \mathrm{pF}$
- Measurement points are done at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$

Refer to Section 6.3.17 for more details on the input/output alternate function characteristics.

## $1^{2} S$ interface characteristics

Unless otherwise specified, the parameters given in Table 66 for the $I^{2} S$ interface are derived from tests performed under the ambient temperature, $f_{P C L K x}$ frequency and $V_{D D}$ supply voltage conditions summarized in Table 16, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load $\mathrm{C}=30 \mathrm{pF}$
- Measurement points are done at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$

Refer to Section 6.3.17 for more details on the input/output alternate function characteristics (CK, SD, WS).

Table 66. $I^{2} S$ dynamic characteristics ${ }^{(1)}$

| Symbol | Parameter | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |

| $t_{\text {h(SD_ST) }}$ | Data output hold time | Slave transmitter (after enable edge) | 5 | - |  |
| $t_{\text {h(SD_MT) }}$ |  | Master transmitter (after enable edge) | 1 | - |  |

1. Guaranteed based on test during characterization.
2. The maximum value of $256 x F s$ is 45 MHz (APB1 maximum frequency).
3. Measurement done with respect to I2S_CK rising edge.

Note: $\quad$ Refer to the I2S section of RM0390 reference manual for more details on the sampling frequency ( $F_{S}$ ).
$f_{M C K}, f_{C K}$, and $D_{C K}$ values reflect only the digital peripheral behavior. The values of these parameters might be slightly impacted by the source clock precision. $D_{C K}$ depends mainly on the value of ODD bit. The digital contribution leads to a minimum value of (I2SDIV / (2*I2SDIV + ODD) and a maximum value of (I2SDIV + ODD) / (2*I2SDIV + ODD). $F_{S}$ maximum value is supported for each mode/condition.

Figure 39. $\mathrm{I}^{2}$ S slave timing diagram (Philips protocol) ${ }^{(1)}$

## SAI characteristics

Unless otherwise specified, the parameters given in Table 67 for SAI are derived from tests performed under the ambient temperature, $\mathrm{f}_{\text {PCLKx }}$ frequency and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load $\mathrm{C}=30 \mathrm{pF}$
- Measurement points are performed at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$

Refer to Section 6.3.17 for more details on the input/output alternate function characteristics (SCK,SD,WS).

Table 67. SAI characteristics ${ }^{(1)}$

| Symbol | Parameter | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {MCK }}$ | SAI Main clock output | - | $256 \times 8 \mathrm{~K}$ | $256 \times$ Fs | MHz |

|  | $V_{D I}{ }^{(3)}$ | Differential input sensitivity | I(USB_FS_DP/DM, USB_HS_DP/DM) | 0.2 | - | - | V |
|  | $\mathrm{V}_{\mathrm{CM}}{ }^{(3)}$ | Differential common mode range | Includes $\mathrm{V}_{\text {DI }}$ range | 0.8 | - | 2.5 |  |
|  | $V_{S E}{ }^{(3)}$ | Single ended receiver threshold | - | 1.3 | - | 2.0 |  |
| Output levels | $\mathrm{V}_{\mathrm{OL}}$ | Static output level low | $\mathrm{R}_{\mathrm{L}}$ of $1.5 \mathrm{k} \Omega$ to $3.6 \mathrm{~V}^{(4)}$ | - | - | 0.3 | V |
|  | $\mathrm{V}_{\mathrm{OH}}$ | Static output level high | $\mathrm{R}_{\mathrm{L}}$ of $15 \mathrm{k} \Omega$ to $\mathrm{V}_{\mathrm{SS}}{ }^{(4)}$ | 2.8 | - | 3.6 |  |
| $\mathrm{R}_{\mathrm{PD}}$ |  | PA11, PA12, PB14, PB15 (USB_FS_DP/DM, USB_HS_DP/DM) | $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {DDUSB }}$ | 17 | 21 | 24 | $\mathrm{k} \Omega$ |
|  |  | PA9, PB13 (OTG_FS_VBUS, OTG_HS_VBUS) |  | 0.65 | 1.1 | 2.0 |  |
| $\mathrm{R}_{\mathrm{PU}}$ |  | PA12, PB15 (USB_FS_DP, USB_HS_DP) | $\mathrm{V}_{\mathrm{IN}}=\mathrm{V}_{\text {SS }}$ | 1.5 | 1.8 | 2.1 |  |
|  |  | PA9, PB13 (OTG_FS_VBUS, OTG_HS_VBUS) | $\mathrm{V}_{\mathrm{IN}}=\mathrm{V}_{\text {SS }}$ | 0.25 | 0.37 | 0.55 |  |

1. All the voltages are measured from the local ground potential.
2. The USB OTG full speed transceiver functionality is ensured down to 2.7 V but not the full USB full speed electrical characteristics which are degraded in the 2.7 to $3.0 \mathrm{~V} \mathrm{~V}_{\mathrm{DD}}$ voltage range.
3. Guaranteed by design.
4. $R_{\mathrm{L}}$ is the load connected on the USB OTG full speed drivers.

Note: $\quad$ When VBUS sensing feature is enabled, PA9 and PB13 must be left at their default state (floating input), not as alternate function. A typical $200 \mu$ A current consumption of the sensing block (current to voltage conversion to determine the different sessions) can be observed on PA9 and PB13 when the feature is enabled.

Figure 43. USB OTG full speed timings: definition of data signal rise and fall time

Table 70. USB OTG full speed electrical characteristics ${ }^{(1)}$

| Driver characteristics |  |  |  |  |  |

| $\mathrm{t}_{\mathrm{rfm}}$ | Rise/ fall time matching | $\mathrm{t}_{\mathrm{r}} \mathrm{t}_{\mathrm{f}}$ | 90 | 110 | $\%$ |
| $\mathrm{~V}_{\mathrm{CRS}}$ | Output signal crossover voltage | - | 1.3 | 2.0 | V |
| $\mathrm{Z}_{\mathrm{DRV}}$ | Output driver impedance $^{(3)}$ | Driving high or <br> low | 28 | 44 | $\Omega$ |

1. Guaranteed by design.
2. Measured from $10 \%$ to $90 \%$ of the data signal. For more detailed informations, refer to USB Specification Chapter 7 (version 2.0).
3. No external termination series resistors are required on $D P(D+)$ and $D M(D-)$ pins since the matching impedance is included in the embedded driver.

## USB high speed (HS) characteristics

Unless otherwise specified, the parameters given in Table 73 for ULPI are derived from tests performed under the ambient temperature, $\mathrm{f}_{\mathrm{HCLK}}$ frequency summarized in Table 72 and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 71, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10, unless otherwise specified
- Capacitive load $C=30 \mathrm{pF}$, unless otherwise specified
- Measurement points are done at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$.

Refer to Section 6.3.17 for more details on the input/output characteristics.
Table 71. USB HS DC electrical characteristics

| Symbol |  | Parameter | Min. $^{(1)}$ | Max. $^{(1)}$ | Unit |

|  |  | $\begin{aligned} & 1.71 \mathrm{~V}<\mathrm{V}_{\mathrm{DD}}<3.6 \mathrm{~V}, \\ & \mathrm{C}_{\mathrm{L}}=15 \mathrm{pF} \end{aligned}$ | - | 6 | 11.5 |  |

1. Guaranteed based on test during characterization.

## CAN (controller area network) interface

Refer to Section 6.3.17 for more details on the input/output alternate function characteristics (CANx_TX and CANx_RX).

### 6.3.21 12-bit ADC characteristics

Unless otherwise specified, the parameters given in Table 74 are derived from tests performed under the ambient temperature, $\mathrm{f}_{\text {PCLK2 }}$ frequency and $\mathrm{V}_{\text {DDA }}$ supply voltage conditions summarized in Table 16.

Table 74. ADC characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {DDA }}$ | Power supply | $\mathrm{V}_{\text {DDA }}-\mathrm{V}_{\text {REF+ }}<1.2 \mathrm{~V}$ | $1.7{ }^{(1)}$ | - | 3.6 | V |
| $V_{\text {REF+ }}$ | Positive reference voltage |  | $1.7{ }^{(1)}$ | - | $\mathrm{V}_{\text {DDA }}$ |  |
| $\mathrm{V}_{\text {REF- }}$ | Negative reference voltage | - | - | 0 | - |  |
| $\mathrm{f}_{\text {ADC }}$ | ADC clock frequency | $\mathrm{V}_{\text {DDA }}=1.7^{(1)}$ to 2.4 V | 0.6 | 15 | 18 | MHz |
|  |  | $\mathrm{V}_{\text {DDA }}=2.4$ to 3.6 V | 0.6 | 30 | 36 | MHz |
| $\mathrm{f}_{\text {TRIG }}{ }^{(2)}$ | External trigger frequency | $\begin{aligned} & \mathrm{f}_{\mathrm{ADC}}=30 \mathrm{MHz}, \\ & 12 \text {-bit resolution } \end{aligned}$ | - | - | 1764 | kHz |
|  |  | - | - | - | 17 | $1 / f_{\text {ADC }}$ |
| $\mathrm{V}_{\text {AIN }}$ | Conversion voltage range ${ }^{(3)}$ | - | $0\left(V_{S S A} \text { or } V_{\text {REF }}\right.$ tied to ground) | - | $\mathrm{V}_{\text {REF+ }}$ | V |
| $\mathrm{R}_{\text {AIN }}{ }^{(2)}$ | External input impedance | See Equation 1 for details | - | - | 50 | $\kappa \Omega$ |

| $\mathrm{t}_{\text {at }}{ }^{(2)}$ | Injection trigger conversion latency | $\mathrm{f}_{\text {ADC }}=30 \mathrm{MHz}$ | - | - | 0.100 | $\mu \mathrm{s}$ |
|  |  | - | - | - | $3^{(5)}$ | $1 / f_{\text {ADC }}$ |
| $t_{\text {latr }}{ }^{(2)}$ | Regular trigger conversion latency | $\mathrm{f}_{\text {ADC }}=30 \mathrm{MHz}$ | - | - | 0.067 | $\mu \mathrm{s}$ |
|  |  | - | - | - | $2^{(5)}$ | 1/f ${ }_{\text {ADC }}$ |
| $\mathrm{ts}^{(2)}$ | Sampling time | $\mathrm{f}_{\text {ADC }}=30 \mathrm{MHz}$ | 0.100 | - | 16 | $\mu \mathrm{s}$ |
|  |  | - | 3 | - | 480 | $1 / f_{\text {ADC }}$ |
| $\mathrm{t}_{\text {STAB }}{ }^{(2)}$ | Power-up time | - | - | 2 | 3 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{CONV}}{ }^{(2)}$ | Total conversion time (including sampling time) | $\begin{aligned} & \mathrm{f}_{\mathrm{ADC}}=30 \mathrm{MHz} \\ & 12 \text {-bit resolution } \end{aligned}$ | 0.50 | - | 16.40 | $\mu \mathrm{s}$ |
|  |  | $\begin{aligned} & \mathrm{f}_{\mathrm{ADC}}=30 \mathrm{MHz} \\ & 10 \text {-bit resolution } \end{aligned}$ | 0.43 | - | 16.34 | $\mu \mathrm{s}$ |
|  |  | $\mathrm{f}_{\mathrm{ADC}}=30 \mathrm{MHz}$ 8-bit resolution | 0.37 | - | 16.27 | $\mu \mathrm{s}$ |
|  |  | $\mathrm{f}_{\mathrm{ADC}}=30 \mathrm{MHz}$ 6-bit resolution | 0.30 | - | 16.20 | $\mu \mathrm{s}$ |
|  |  | 9 to 492 ( $\mathrm{t}_{\mathrm{S}}$ for sampling +n -bit resolution for successive approximation) |  |  |  | 1/f ${ }_{\text {ADC }}$ |

Table 74. ADC characteristics (continued)

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{S}{ }^{(2)}$ | Sampling rate ( $\mathrm{f}_{\mathrm{ADC}}=30 \mathrm{MHz}$, and $\mathrm{t}_{\mathrm{S}}=3$ ADC cycles) | 12-bit resolution Single ADC | - | - | 2 | Msps |
|  |  | 12-bit resolution Interleave Dual ADC mode | - | - | 3.75 | Msps |
|  |  | 12-bit resolution Interleave Triple ADC mode | - | - | 6 | Msps |
| $\mathrm{IVREF+}^{(2)}$ | ADC $V_{\text {REF }}$ DC current consumption in conversion mode | - | - | 300 | 500 | $\mu \mathrm{A}$ |
| $\mathrm{IVDDA}^{(2)}$ | ADC $V_{D D A}$ DC current consumption in conversion mode | - | - | 1.6 | 1.8 | mA |

1. $V_{\text {DDA }}$ minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to Section 3.16.2: Internal reset OFF).
2. Guaranteed based on test during characterization.
3. $\mathrm{V}_{\mathrm{REF}+}$ is internally connected to $\mathrm{V}_{\mathrm{DDA}}$ and $\mathrm{V}_{\mathrm{REF}}$ is internally connected to $\mathrm{V}_{\mathrm{SSA}}$.
4. $R_{A D C}$ maximum value is given for $V_{D D}=1.7 \mathrm{~V}$, and minimum value for $V_{D D}=3.3 \mathrm{~V}$.
5. For external triggers, a delay of $1 / \mathrm{f}_{\text {PCLK2 }}$ must be added to the latency specified in Table 74 .

## Equation 1: $\mathbf{R}_{\text {AIN }}$ max formula

$$
R_{A I N}=\frac{(k-0.5)}{f_{A D C} \times C_{A D C} \times \ln \left(2^{N+2}\right)}-R_{A D C}
$$

The formula above (Equation 1) is used to determine the maximum external impedance allowed for an error below $1 / 4$ of LSB. $\mathrm{N}=12$ (from 12-bit resolution) and $k$ is the number of sampling periods defined in the ADC_SMPR1 register.

Table 75. ADC static accuracy at $\mathrm{f}_{\mathrm{ADC}}=18 \mathrm{MHz}^{(1)}$

| Symbol | Parameter | Test conditions | Typ | Max ${ }^{(2)}$ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ET | Total unadjusted error | $\begin{aligned} & \mathrm{f}_{\mathrm{ADC}}=18 \mathrm{MHz} \\ & \mathrm{~V}_{\mathrm{DDA}}=1.7 \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{REF}}=1.7 \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{DDA}}-\mathrm{V}_{\mathrm{REF}}<1.2 \mathrm{~V} \end{aligned}$ | $\pm 3$ | $\pm 4$ | LSB |
| EO | Offset error |  | $\pm 2$ | $\pm 3$ |  |
| EG | Gain error |  | $\pm 1$ | $\pm 3$ |  |
| ED | Differential linearity error |  | $\pm 1$ | $\pm 2$ |  |
| EL | Integral linearity error |  | $\pm 2$ | $\pm 3$ |  |

1. Better performance can be achieved with restricted $V_{D D}$, frequency and temperature ranges.
2. Guaranteed based on test during characterization.

Table 76. ADC static accuracy at $\mathrm{f}_{\mathrm{ADC}}=\mathbf{3 0} \mathrm{MHz}^{(1)}$

| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ENOB | Effective number of bits | $\begin{aligned} & \mathrm{f}_{\mathrm{ADC}}=36 \mathrm{MHz} \\ & \mathrm{~V}_{\mathrm{DDA}}=\mathrm{V}_{\text {REF+ }}=3.3 \mathrm{~V} \\ & \text { Input Frequency }=20 \mathrm{KHz} \\ & \text { Temperature }=25^{\circ} \mathrm{C} \end{aligned}$ | 10.6 | 10.8 | - | bits |
| SINAD | Signal-to noise and distortion ratio |  | 66 | 67 | - | dB |
| SNR | Signal-to noise ratio |  | 64 | 68 | - |  |
| THD | Total harmonic distortion |  | -70 | -72 | - |  |

1. Guaranteed based on test during characterization.

Note: $\quad$ ADC accuracy vs. negative injection current: injecting a negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion
being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.

Any positive injection current within the limits specified for $\mathrm{I}_{\mathrm{INJ}(\mathrm{PIN})}$ and $\Sigma \mathrm{l}_{\mathrm{INJ}(\mathrm{PIN})}$ in Section 6.3.17 does not affect the ADC accuracy.

Figure 45. ADC accuracy characteristics

1. See also Table 76.
. Example of an actual transfer curve.
. Ideal transfer curve.
End point correlation line.
. $\mathrm{E}_{\mathrm{T}}=$ Total unadjusted error: maximum deviation between the actual and the ideal transfer curves.
$\mathrm{E}_{\mathrm{O}}=$ Offset error: deviation between the first actual transition and the first ideal one.
$\mathrm{E}_{\mathrm{G}}=$ Gain error: deviation between the last ideal transition and the last actual one.
$E_{D}=$ Differential linearity error: maximum deviation between actual steps and the ideal one.
$\mathrm{E}_{\mathrm{L}}$ = Integral linearity error: maximum deviation between any actual transition and the end point correlation line.

Figure 46. Typical connection diagram using the ADC

1. Refer to Table 74 for the values of $R_{\text {AIN }}, R_{A D C}$ and $C_{A D C}$.
2. $\mathrm{C}_{\text {parasitic }}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance ( $\sim 5 \mathrm{pF}$ ). A high $\mathrm{C}_{\text {parasitic }}$ value downgrades conversion accuracy. To remedy this, $\mathrm{f}_{\text {ADC }}$ has to be reduced.

## General PCB design guidelines

Power supply decoupling should be performed as shown in Figure 47 or Figure 48, depending on whether $\mathrm{V}_{\text {REF+ }}$ is connected to $\mathrm{V}_{\text {DDA }}$ or not. The 10 nF capacitors should be ceramic (good quality). They should be placed as close as possible to the chip.

Figure 47. Power supply and reference decoupling ( $\mathrm{V}_{\mathrm{REF}+}$ not connected to $\mathrm{V}_{\text {DDA }}$ )

1. $\mathrm{V}_{\text {REF+ }}$ and $\mathrm{V}_{\text {REF- }}$ inputs are both available on UFBGA144. $\mathrm{V}_{\text {REF+ }}$ is also available on LQFP100, LQFP144, and WLCSP81. When $\mathrm{V}_{\text {REF+ }}$ and $\mathrm{V}_{\text {REF- }}$ are not available, they are internally connected to $\mathrm{V}_{\mathrm{DDA}}$ and $\mathrm{V}_{\mathrm{SSA}}$.

Figure 48. Power supply and reference decoupling ( $\mathrm{V}_{\text {REF+ }}$ connected to $\mathrm{V}_{\text {DDA }}$ )

1. $V_{R E F+}$ and $V_{R E F-}$ inputs are both available on UFBGA144. $V_{R E F+}$ is also available on LQFP100, LQFP144, and WLCSP81. When $\mathrm{V}_{\text {REF+ }}$ and $\mathrm{V}_{\text {REF- }}$ are not available, they are internally connected to $\mathrm{V}_{\text {DDA }}$ and $\mathrm{V}_{\mathrm{SSA}}$.

### 6.3.22 Temperature sensor characteristics

Table 80. Temperature sensor characteristics

| Symbol | Parameter | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\mathrm{L}}{ }^{(1)}$ | $\mathrm{V}_{\text {SENSE }}$ linearity with temperature | - | $\pm 1$ | $\pm 2$ | ${ }^{\circ} \mathrm{C}$ |
| Avg_Slope $^{(1)}$ | Average slope | - | 2.5 | - | $\mathrm{mV} /{ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{25}{ }^{(1)}$ | Voltage at $25^{\circ} \mathrm{C}$ | - | 0.76 | - | V |
| $\mathrm{t}_{\text {START }}{ }^{(2)}$ | Startup time | - | 6 | 10 | $\mu \mathrm{~s}$ |
| $\mathrm{~T}_{\text {S_temp }}{ }^{(2)}$ | ADC sampling time when reading the temperature $\left(1^{\circ} \mathrm{C}\right.$ accuracy $)$ | 10 | - | - | $\mu \mathrm{s}$ |

1. Guaranteed based on test during characterization.
2. Guaranteed by design.

Table 81. Temperature sensor calibration values

| Symbol | Parameter | Memory address |
| :---: | :--- | :---: |
| TS_CAL1 | TS ADC raw data acquired at temperature of $30^{\circ} \mathrm{C}, \mathrm{V}_{\text {DDA }}=3.3 \mathrm{~V}$ | $0 \times 1$ FFF 7A2C $-0 \times 1 F F F$ 7A2D |
| TS_CAL2 | TS ADC raw data acquired at temperature of $110^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DDA}}=3.3 \mathrm{~V}$ | $0 \times 1 \mathrm{FFF} 7 \mathrm{7A2E}-0 \times 1 \mathrm{FFF} 7 \mathrm{~A} 2 \mathrm{~F}$ |

### 6.3.23 $\quad V_{B A T}$ monitoring characteristics

Table 82. $\mathrm{V}_{\mathrm{BAT}}$ monitoring characteristics

| Symbol | Parameter | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: |
| R | Resistor bridge for $\mathrm{V}_{\mathrm{BAT}}$ | - | 50 | - | $\mathrm{K} \Omega$ |
| Q | Ratio on $\mathrm{V}_{\mathrm{BAT}}$ measurement | - | 4 | - | - |
| $\mathrm{Er}^{(1)}$ | Error on Q | -1 | - | +1 | $\%$ |
| $\mathrm{~T}_{\text {S_vbat }^{(2)(2)}}$ | ADC sampling time when reading the $\mathrm{V}_{\mathrm{BAT}}$ <br> 1 mV accuracy | 5 | - | - | $\mu \mathrm{s}$ |

1. Guaranteed by design.
2. Shortest sampling time can be determined in the application by multiple iterations.

### 6.3.24 Reference voltage

The parameters given in Table 83 are derived from tests performed under ambient temperature and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16.

Table 83. internal reference voltage

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {REFINT }}$ | Internal reference voltage | $-40^{\circ} \mathrm{C}<\mathrm{T}_{\mathrm{A}}<+105^{\circ} \mathrm{C}$ | 1.18 | 1.21 | 1.24 | V |
| $\mathrm{~T}_{\text {S_vrefint }{ }^{(1)}}$ADC sampling time when reading the <br> internal reference voltage | - | 10 | - | - | $\mu \mathrm{s}$ |  |
| $\mathrm{V}_{\text {RERINT_s }}{ }^{(2)}$ | Internal reference voltage spread over the <br> temperature range | $\mathrm{V}_{\mathrm{DD}}=3 \mathrm{~V} \pm 10 \mathrm{mV}$ | - | 3 | 5 | mV |
| $\mathrm{T}_{\text {Coeff }^{(2)}}{ }^{(2)}$ | Temperature coefficient | - | - | 30 | 50 | $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$ |
| $\mathrm{t}_{\text {START }}{ }^{(2)}$ | Startup time | - | - | 6 | 10 | $\mu \mathrm{~s}$ |

1. Shortest sampling time can be determined in the application by multiple iterations.
2. Guaranteed by design.

Table 84. Internal reference voltage calibration values

| Symbol | Parameter | Memory address |
| :---: | :---: | :---: |
| $V_{\text {REFIN_CAL }}$ | Raw data acquired at temperature of $30^{\circ} \mathrm{C}_{\text {VDDA }}=3.3 \mathrm{~V}$ | $0 \times 1$ FFF 7A2A - 0x1FFF 7A2B |

### 6.3.25 DAC electrical characteristics

Table 85. DAC characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit | Comments |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {DDA }}$ | Analog supply <br> voltage | - | 1.7 <br> $(1)$ | - | 3.6 | V | - |
| $\mathrm{V}_{\text {REF+ }}$ | Reference supply <br> voltage | - | 1.7 <br> $1)$ | - | 3.6 | V | $\mathrm{~V}_{\text {REF }} \leq \mathrm{V}_{\text {DDA }}$ |

Table 85. DAC characteristics (continued)

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit | Comments |
| :---: | :--- | :--- | :--- | :---: | :---: | :---: | :---: | :--- |

Table 85. DAC characteristics (continued)

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| INL ${ }^{(4)}$ | Integral non linearity (difference between measured value at Code i and the value at Code ion a line drawn between Code 0 and last Code 1023) | - | - | - | $\pm 1$ | LSB | Given for the DAC in 10-bit configuration. |
|  |  | - | - | - | $\pm 4$ | LSB | Given for the DAC in 12-bit configuration. |
| Offset ${ }^{(4)}$ | Offset error (difference between measured value at Code (0x800) and the ideal value $=$ $\mathrm{V}_{\mathrm{REF}+} / 2$ ) | - | - | - | $\pm 10$ | mV | Given for the DAC in 12-bit configuration |
|  |  | - | - | - | $\pm 3$ | LSB | Given for the DAC in 10-bit at $\mathrm{V}_{\text {REF }+}=3.6 \mathrm{~V}$ |
|  |  | - | - | - | $\pm 12$ | LSB | Given for the DAC in 12-bit at $\mathrm{V}_{\text {REF }+}=3.6 \mathrm{~V}$ |
| $\begin{gathered} \text { Gain } \\ \text { error }^{(4)} \end{gathered}$ | Gain error | - | - | - | $\pm 0.5$ | \% | Given for the DAC in 12-bit configuration |
| $\mathrm{t}_{\text {SETTLING }}{ }^{(4)}$ | Total harmonic distortion <br> Buffer ON | - | - | 3 | 6 | $\mu \mathrm{s}$ | $\begin{aligned} & \mathrm{C}_{\mathrm{LOAD}} \leq 50 \mathrm{pF}, \\ & \mathrm{R}_{\mathrm{LOAD}} \geq 5 \mathrm{k} \Omega \end{aligned}$ |
| THD ${ }^{(4)}$ | - | - | - | - | - | dB | $\begin{aligned} & \mathrm{C}_{\text {LOAD }} \leq 50 \mathrm{pF}, \\ & \mathrm{R}_{\text {LOAD }} \geq 5 \mathrm{k} \Omega \end{aligned}$ |
| Update rate ${ }^{(2)}$ | Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1 LSB) | - | - | - | 1 | $\begin{gathered} \mathrm{MS} / \\ \mathrm{s} \end{gathered}$ | $\begin{aligned} & \mathrm{C}_{\text {LOAD }} \leq 50 \mathrm{pF}, \\ & \mathrm{R}_{\text {LOAD }} \geq 5 \mathrm{k} \Omega \end{aligned}$ |
| $\mathrm{t}_{\text {WAKEUP }}{ }^{(4)}$ | Wakeup time from off state (Setting the ENx bit in the DAC Control register) | - | - | 6.5 | 10 | $\mu \mathrm{s}$ | $\mathrm{C}_{\text {LOAD }} \leq 50 \mathrm{pF}, \mathrm{R}_{\text {LOAD }} \geq 5 \mathrm{k} \Omega$ input code between lowest and highest possible ones. |
| PSRR+ ${ }^{(2)}$ | Power supply rejection ratio (to $V_{\text {DDA }}$ ) (static DC measurement) | - | - | -67 | -40 | dB | No $\mathrm{R}_{\text {LOAD }}, \mathrm{C}_{\text {LOAD }}=50 \mathrm{pF}$ |

1. $V_{\text {DDA }}$ minimum value of 1.7 V is obtained with the use of an external power supply supervisor (refer to Section 3.16.2: Internal reset OFF).
2. Guaranteed by design.
3. The quiescent mode corresponds to a state where the DAC maintains a stable output level to ensure that no dynamic consumption occurs.
4. Guaranteed based on test during characterization.

Figure 49. 12-bit buffered/non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC_CR register.

### 6.3.26 FMC characteristics

Unless otherwise specified, the parameters given in Table 86 to Table 93 for the FMC interface are derived from tests performed under the ambient temperature, $\mathrm{f}_{\mathrm{HCLK}}$ frequency and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 15 , with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitance load C=30 pF
- Measurement points are done at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$

Refer to Section 6.3.17 for more details on the input/output characteristics.

## Asynchronous waveforms and timings

Figure 50 through Figure 53 represent asynchronous waveforms and Table 86 through Table 93 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- AddressSetupTime $=0 \times 1$
- AddressHoldTime $=0 \times 1$
- DataSetupTime $=0 \times 1$ (except for asynchronous NWAIT mode , DataSetupTime $=0 \times 5$ )
- BusTurnAroundDuration $=0 \times 0$

In all timing tables, the $\mathrm{T}_{\text {HCLK }}$ is the HCLK clock period.

Figure 50. Asynchronous non-multiplexed SRAM/PSRAM/NOR read waveforms

1. Mode 2/B, C and D only. In Mode 1, FMC_NADV is not used.

Table 86. Asynchronous non-multiplexed SRAM/PSRAM/NOR Read timings ${ }^{(1)(2)}$

| Symbol | Parameter | Min | Max | Unit |
| :---: | :--- | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{w} \text { (NE) }}$ | FMC_NE low time | $2 \mathrm{~T}_{\text {HCLK }}-2$ | $2 \mathrm{~T}_{\text {HCLK }}+0.5$ |  |

## Synchronous waveforms and timings

Figure 54 through Figure 57 represent synchronous waveforms and Table 94 through Table 97 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- BurstAccessMode = FMC_BurstAccessMode_Enable;
- MemoryType = FMC_MemoryType_CRAM;
- WriteBurst = FMC_WriteBurst_Enable;
- CLKDivision = 1; (0 is not supported, see the STM32F446 reference manual: RM0390)
- DataLatency $=1$ for NOR Flash; DataLatency $=0$ for PSRAM

In all timing tables, the $\mathrm{T}_{\text {HCLK }}$ is the HCLK clock period (with maximum FMC_CLK = 90 MHz ).

## NAND controller waveforms and timings

Figure 58 through Figure 61 represent synchronous waveforms, and Table 98 and Table 99 provide the corresponding timings. The results shown in this table are obtained with the following FMC configuration:

- COM.FSMC_SetupTime $=0 \times 01$;
- COM.FMC_WaitSetupTime $=0 \times 03$;
- COM.FMC_HoldSetupTime $=0 \times 02$;
- COM.FMC_HiZSetupTime $=0 \times 01$;
- ATT.FMC_SetupTime $=0 \times 01$;
- ATT.FMC_WaitSetupTime $=0 \times 03$;
- ATT.FMC_HoldSetupTime $=0 \times 02$;
- ATT.FMC_HiZSetupTime $=0 \times 01$;
- Bank = FMC_Bank_NAND;
- MemoryDataWidth = FMC_MemoryDataWidth_16b;
- ECC = FMC_ECC_Enable;
- ECCPageSize = FMC_ECCPageSize_512Bytes;
- TCLRSetupTime = 0;
- TARSetupTime $=0$.

In all timing tables, the $\mathrm{T}_{\text {HCLK }}$ is the HCLK clock period.

1. $C L=10 \mathrm{pF}$.
2. Guaranteed based on test during characterization.

### 6.3.27 Camera interface (DCMI) timing specifications

Unless otherwise specified, the parameters given in Table 104 for DCMI are derived from tests performed under the ambient temperature, f f нLK frequency and $\mathrm{V}_{\mathrm{DD}}$ supply voltage summarized in Table 16, with the following configuration:

- DCMI_PIXCLK polarity: falling
- DCMI_VSYNC and DCMI_HSYNC polarity: high
- Data formats: 14 bits

Table 104. DCMI characteristics

| Symbol | Parameter | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: |
| - | Frequency ratio DCMI_PIXCLK/f HCLK | - | 0.4 | - |
| DCMI_PIXCLK | Pixel clock input | - | 54 | MHz |
| $\mathrm{D}_{\text {Pixel }}$ | Pixel clock input duty cycle | 30 | 70 | \% |
| $\mathrm{t}_{\text {su(DATA) }}$ | Data input setup time | 1 | - | ns |
| $\mathrm{t}_{\mathrm{h} \text { (DATA) }}$ | Data input hold time | 3.5 | - |  |
| $\mathrm{t}_{\text {su(HSYNC) }}$ <br> $\mathrm{t}_{\text {su(VSYNC) }}$ | DCMI_HSYNC/DCMI_VSYNC input setup time | 2 | - |  |
| $\mathrm{t}_{\mathrm{h} \text { (HSYNC) }}$ $t_{h(V S Y N C)}$ | DCMI_HSYNC/DCMI_VSYNC input hold time | 0 | - |  |

Figure 64. DCMI timing diagram

### 6.3.28 SD/SDIO MMC card host interface (SDIO) characteristics

Unless otherwise specified, the parameters given in Table 105 for the SDIO are derived from tests performed under the ambient temperature, $\mathrm{f}_{\mathrm{PCLK}}$ frequency and $\mathrm{V}_{\mathrm{DD}}$ supply voltage conditions summarized in Table 16, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load $\mathrm{C}=30 \mathrm{pF}$
- Measurement points are done at CMOS levels: $0.5 \mathrm{~V}_{\mathrm{DD}}$

Refer to Section 6.3.17 for more details on the input/output characteristics.
Figure 65. SDIO high-speed mode

Figure 66. SD default mode

Table 105. Dynamic characteristics: SD / MMC characteristics ${ }^{(1)(2)}$

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\mathrm{PP}}$ | Clock frequency in data transfer mode | - | 0 | - | 50 | MHz |

## 7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com.

### 7.1 LQFP64 package information

LQFP64 is a $10 \times 10 \mathrm{~mm}$, 64-pin low-profile quad flat package.

Figure 68. LQFP64 recommended footprint

1. Drawing is not to scale.
2. Dimensions are in millimeters.

## Device marking for LQFP64

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

The printed markings may differ depending upon the supply chain.
Figure 69. LQFP64 marking example (package top view)

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

### 7.2 LQFP100 package information

LQFP100 is a $14 \times 14 \mathrm{~mm}, 100$-pin low-profile quad flat package.

The printed markings may differ depending upon the supply chain.
Figure 75. LQFP144 marking example (package top view)

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

### 7.4 UFBGA144 $7 \times 7 \mathrm{~mm}$ package information

UFBGA144 is a $7 \times 7 \mathrm{~mm}, 144-\mathrm{pin}, 0.50 \mathrm{~mm}$ pitch, ultra fine pitch ball grid array package.

Figure 76. UFBGA144 outline

1. Drawing is not in scale.

| Dimension | Recommended values |
| :--- | :--- |
| Pitch | 0.4 mm |
| Dpad | 0.225 mm |
| Dsm | 0.290 mm typ. (depends on the soldermask <br> registration tolerance) |
| Stencil opening | 0.250 mm |
| Stencil thickness | 0.100 mm |

## Device marking for WLCSP81 package

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

The printed markings may differ depending upon the supply chain.
Figure 84. WLCSP81 marking example (package top view)

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

### 7.7 Thermal characteristics

The maximum chip-junction temperature, $T_{J}$ max, in degrees Celsius, can be calculated using the following equation:
$T_{J} \max =T_{A} \max +\left(P_{D} \max x \Theta_{J A}\right)$
where:

- $\quad \mathrm{T}_{\mathrm{A}}$ max is the maximum ambient temperature in ${ }^{\circ} \mathrm{C}$,
- $\quad \Theta_{J A}$ is the package junction-to-ambient thermal resistance, in ${ }^{\circ} \mathrm{C} / \mathrm{W}$,
- $\quad P_{D}$ max is the sum of $P_{I N T} \max$ and $P_{I / O} \max \left(P_{D} \max =P_{I N T} \max +P_{I / O} m a x\right)$,
- $\quad P_{I N T} m a x$ is the product of $I_{D D}$ and $V_{D D}$, expressed in Watts. This is the maximum chip internal power.
$\mathrm{P}_{\mathrm{I} / \mathrm{O}}$ max represents the maximum power dissipation on output pins where:
$\mathrm{P}_{\mathrm{I} / \mathrm{O}} \max =\Sigma\left(\mathrm{V}_{\mathrm{OL}} \times \mathrm{I}_{\mathrm{OL}}\right)+\Sigma\left(\left(\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{OH}}\right) \times \mathrm{I}_{\mathrm{OH}}\right)$,
taking into account the actual $\mathrm{V}_{\mathrm{OL}} / \mathrm{I}_{\mathrm{OL}}$ and $\mathrm{V}_{\mathrm{OH}} / \mathrm{I}_{\mathrm{OH}}$ of the $\mathrm{I} / \mathrm{Os}$ at low and high level in the application.

Table 117. Package thermal characteristics

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\Theta_{\mathrm{JA}}$ | Thermal resistance junction-ambient <br> LQFP64 $-10 \times 10 \mathrm{~mm}$ | 46 |  |
|  | Thermal resistance junction-ambient <br> LQFP100 $-14 \times 14 \mathrm{~mm} / 0.5 \mathrm{~mm}$ pitch | 42 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  | Thermal resistance junction-ambient <br> LQFP144 $-20 \times 20 \mathrm{~mm} / 0.5 \mathrm{~mm}$ pitch | 33 |  |
|  | Thermal resistance junction-ambient <br> UFBGA144 $-7 \times 7 \mathrm{~mm} / 0.5 \mathrm{~mm}$ pitch | 51 |  |
|  | Thermal resistance junction-ambient <br> UFBGA144 $-10 \times 10 \mathrm{~mm} / 0.8 \mathrm{~mm}$ pitch | 48 |  |
|  | Thermal resistance junction-ambient <br> WLCSP81 | 48 |  |

## Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from www.jedec.org.

## $8 \quad$ Part numbering

Example:

Device family
STM32 = Arm-based 32-bit microcontroller
Product type
F = General purpose
Device subfamily
446= STM32F446xC/E

Pin count
$\mathrm{M}=81$ pins
$\mathrm{R}=64$ pins
$V=100$ pins
$Z=144$ pins
Flash memory size
C=256 Kbytes of Flash memory
$\mathrm{E}=512$ Kbytes of Flash memory

## Package

$\mathrm{H}=\mathrm{UFBGA}(7 \times 7 \mathrm{~mm})$
$J=\operatorname{UFBGA}(10 \times 10 \mathrm{~mm})$
T = LQFP
Y = WLCSP

Temperature range
$6=$ Industrial temperature range, -40 to $85^{\circ} \mathrm{C}$.
$7=$ Industrial temperature range, -40 to $105^{\circ} \mathrm{C}$.

Option specific package
$M=$ Specific supply chain ${ }^{(1)}$
blank $=$ Standard

## Options

xxx = programmed parts
TR = tape and reel

1. Option available only on STM32F446MEY6MTR part number under specific ordering conditions

For a list of available options (speed, package, etc.) or for further information on any aspect of these devices contact your nearest ST sales office.

## Appendix A Application block diagrams

## A. 1 USB OTG full speed (FS) interface solutions

Figure 85. USB controller configured as peripheral-only and used in full speed mode

1. External voltage regulator only needed when building a $\mathrm{V}_{\mathrm{B}}$, powered device.
2. The same application can be developed using the OTG HS in FS mode to achieve enhanced performance thanks to the large Rx/Tx FIFO and to a dedicated DMA controller.

Figure 86. USB controller configured as host-only and used in full speed mode

1. The current limiter is required only if the application has to support a $V_{B U s}$ powered device. A basic power switch can be used if 5 V are available on the application board.
2. The same application can be developed using the OTG HS in FS mode to achieve enhanced performance thanks to the large Rx/Tx FIFO and to a dedicated DMA controller.

Figure 87. USB controller configured in dual mode and used in full speed mode

1. External voltage regulator only needed when building a $\mathrm{V}_{\mathrm{B}}$, powered device.
2. The current limiter is required only if the application has to support a $V_{B U S}$ powered device. A basic power switch can be used if 5 V are available on the application board.
3. The ID pin is required in dual role only.
4. The same application can be developed using the OTG HS in FS mode to achieve enhanced performance thanks to the large Rx/Tx FIFO and to a dedicated DMA controller.

## A. 2 USB OTG high speed (HS) interface solutions

Figure 88. USB controller configured as peripheral, host, or dual-mode and used in high speed mode

1. It is possible to use MCO 1 or MCO 2 to save a crystal. It is however not mandatory to clock the STM32F446xx with a 24 or 26 MHz crystal when using USB HS. The above figure only shows an example of a possible connection.
2. The ID pin is required in dual role only.

## Revision history

Table 118. Document revision history

| Date | Revision | Changes |
| :---: | :---: | :---: |
| 17-Feb-2015 | 1 | Initial release. |
| 16-Mar-2015 | 2 | Added note 2 inside Table 2 <br> Updated Table 11, Table 23, Table 24, Table 25, Table 26, Table 30, Table 51, Table 52, Table 53, and Table 61 <br> Added condition inside Typical and maximum current consumption and Additional current consumption <br> Added FMPI2C characteristics <br> Added Table 62 and Figure 35 |
| 29-May-2015 | 3 | Updated: <br> - Section 6.3.15: Absolute maximum ratings (electrical sensitivity) <br> - Section 7: Package information <br> - Table 2: STM32F446xC/E features and peripheral counts <br> - Table 13: STM32F446xC/xE WLCSP81 ballout <br> - Figure 53: ESD absolute maximum ratings <br> - Figure 54: Synchronous multiplexed NOR/PSRAM read timings <br> Added: <br> - Figure 78: UFBGA144 $7 \times 7$ mm marking example (package top view), <br> - Figure 81: UFBGA144 $10 \times 10$ mm marking example (package top view), <br> - Figure 84: WLCSP81 marking example (package top view) |
| 10-Aug-2015 | 4 | Updated: <br> - Figure 14: STM32F446xC/xE UFBGA144 ballout <br> - Table 10: STM32F446xx pin and ball descriptions <br> - Table 18: VCAP_1 / VCAP_2 operating conditions <br> - Section 3.15: Power supply schemes <br> - Section 6.3.2: VCAP_1 / VCAP_2 external capacitor <br> Added: <br> - Figure 5: VDDUSB connected to an external independent power supply <br> - Notes 3 and 4 below Figure 18: Power supply scheme |

Table 118. Document revision history (continued)

| Date | Revision | Changes |
| :---: | :---: | :---: |
| 03-Nov-2015 | 5 | Updated: <br> - Introduction; <br> - Table 2: STM32F446xC/E features and peripheral counts <br> - Table 43: Main PLL characteristics <br> - Title of Table 45: PLLSAI characteristics <br> - Table 109: LQPF100 mechanical data <br> - Table 118: Ordering information scheme <br> - Figure 10: STM32F446xC/xE LQFP64 pinout <br> - Figure 11: STM32F446xC/xE LQFP100 pinout <br> Added: <br> - Figure 77: UFBGA144 recommended footprint <br> - Figure 111: UFBGA144 mechanical data |
| 02-Sep-2016 | 6 | Updated: <br> - Section 7: Package information; <br> - Table 30: Typical current consumption in Run mode, code with data processing running from Flash memory or RAM, regulator ON (ART accelerator enabled except prefetch), VDD $=1.7 \mathrm{~V}$ <br> - Table 74: ADC characteristics <br> - Table 85: DAC characteristics <br> Added: <br> - Note 3 in Figure 33: Recommended NRST pin protection <br> - Note 4 in Table 41: HSI oscillator characteristics |
| 14-Oct-2019 | 7 | Updated document title, Section 6.2: Absolute maximum ratings and Device marking sections. <br> Updated Table 8: USART feature comparison and Table 26: Typical and maximum current consumption in Sleep mode. <br> Updated Figure 1: Compatible board design for LQFP100 package, Figure 2: Compatible board for LQFP64 package, Figure 6: Power supply supervisor interconnection with internal reset OFF, Figure 31: FT I/O input characteristics, Figure $34: I^{2} \mathrm{C}$ bus $A C$ waveforms and measurement circuit, Figure 43: USB OTG full speed timings: definition of data signal rise and fall time, Figure 47: Power supply and reference decoupling ( $V_{R E F+}$ not connected to $V_{D D A}$ ), Figure 78: UFBGA144 $7 x$ 7 mm marking example (package top view) and Figure 81: UFBGA144 $10 \times 10 \mathrm{~mm}$ marking example (package top view). <br> Minor text edits across the whole document. |
| 28-Jul-2020 | 8 | Updated footnote 1 of Table 2: STM32F446xC/E features and peripheral counts and Section 8: Part numbering. <br> Minor text edits across the whole document. |
| 19-Nov-2020 | 9 | Updated Table 10: STM32F446xx pin and ball descriptions. Updated footnotes 1 and 3 of Table 43: Main PLL characteristics. Removed former footnotes 2 from Table 48: Flash memory programming and Table 49: Flash memory programming with VPP. Minor text edits across the whole document. |
| 22-Jan-2021 | 10 | Updated footnote 1 of Table 41: HSI oscillator characteristics. Minor text edits across the whole document. |
