Application

The voltage monitoring relays CM-ESS.2 are designed for use in single-phase AC and/or DC systems for over- or undervoltage monitoring as well as detection of phase loss. The devices are available with different supply voltage ranges, provide an adjustable tripping delay and work according to the open-circuit principle.

Operating mode

The CM-ESS.2 have 2 c/o (SPDT) contacts and include 4 measuring ranges: 3-30 V, 6-60 V, 30-300 V and 60-600 V.

The units are adjusted with front-face operating controls. The selection of over- or undervoltage monitoring is made with a DIP switch. Potentiometers, with direct reading scale, allow the adjustment of the threshold value U, the hysteresis % and the tripping delay T_V. The hysteresis % is adjustable within a range of 3 to 30 % of the threshold value and the tripping delay T_V over a range of instantaneous to a 30 s delay. Timing is displayed by a flashing green LED labelled U/T.

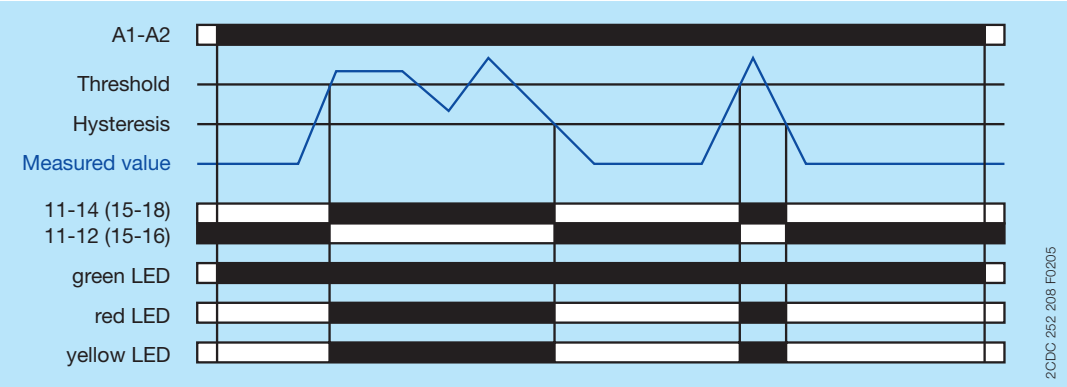
Function diagrams

Overvoltage monitoring

The voltage to be monitored (measured value) is applied to terminals B-C. The control supply voltage applied to terminals A1-A2 is displayed by the glowing green LED.

If the measured value exceeds the adjusted threshold value, the tripping delay T_V starts and the red LED (overvoltage) glows. Timing of T_V is displayed by the flashing ⎍⎍⎍ green LED. When T_V is complete and the measured value still exceeds the threshold value minus the adjusted hysteresis, the output relays energize and the yellow LED (relay energized) glows.

If the measured value drops below the threshold value minus the adjusted hysteresis, the output relays de-energize and the red and yellow LEDs turn off. If control supply voltage is interrupted, the green LED turns off.



Undervoltage monitoring

The voltage to be monitored (measured value) is applied to terminals B-C. The control supply voltage applied to terminals A1-A2 is displayed by the glowing green LED.

If the measured value decreases below the adjusted threshold value, the tripping delay T_V starts and the red LED (undervoltage) flashes ⎍⎍⎍. Timing of T_V is displayed by the flashing ⎍⎍⎍ green LED. When T_V is complete and the measured value is still below the threshold value plus the adjusted hysteresis, the output relays energize and the yellow LED (relay energized) glows.

If the measured value exceeds the threshold value plus the adjusted hysteresis, the output relays de-energize and the red and yellow LEDs turn off.
