

## SN74LVCH8T245 8-BIT Dual-Supply Bus Transceiver

### With Configurable Level-Shifting, Voltage Translation, and 3-State Outputs

#### 1 Features

- Control Inputs (DIR and  $\overline{OE}$ )  $V_{IH}$  and  $V_{IL}$  Levels are Referenced to  $V_{CCA}$
- Bus Hold on Data Inputs Eliminates the Need for External Pullup and Pulldown Resistors
- $V_{CC}$  Isolation
- Fully Configurable Dual-Rail Design
- $I_{off}$  Supports Partial-Power-Down Mode Operation
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22

#### 2 Applications

- Personal Electronics
- Industrial
- Enterprise
- Telecommunications

#### 3 Description

The SN74LVCH8T245 is an 8-bit noninverting bus transceiver that uses two separate configurable power-supply rails. The A port is designed to track  $V_{CCA}$ , which accepts any supply voltage from 1.65 V to 5.5 V. The B port is designed to track  $V_{CCB}$ , which also accepts any supply voltage from 1.65 V to 5.5 V. This allows for universal low-voltage bidirectional translation between any of the 1.8-V, 2.5-V, 3.3-V, and 5.5-V voltage nodes.

The SN74LVCH8T245 is designed for asynchronous communication between two data buses. The logic levels of the direction-control (DIR) input and the output-enable ( $\overline{OE}$ ) input activate either the B-port outputs, the A-port outputs, or place both output ports into a high-impedance state. The device transmits data from the A bus to the B bus when the B-port outputs are activated, and from the B bus to the A bus when the A-port outputs are activated. The input circuitry on both A and B ports are always active.

The SN74LVCH8T245 is designed so that the control pins (DIR and  $\overline{OE}$ ) are referenced to  $V_{CCA}$ .

Active bus-hold circuitry holds unused or undriven inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the device.

The  $V_{CC}$  isolation feature ensures that if either  $V_{CCA}$  or  $V_{CCB}$  is at GND, then the outputs are in the high-impedance state.

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CCA}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Storage temperature, $T_{stg}$		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The output positive-voltage rating may be exceeded up to 6.5 V maximum if the output current rating is observed.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000
		Machine model (MM)	±200

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

 over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)(3)</sup>

		MIN	MAX	UNIT	
$V_{CCA}$	Supply voltage	1.65	5.5	V	
$V_{CCB}$		1.65	5.5		
$V_{IH}$	High-level input voltage <sup>(1)</sup>	Data inputs <sup>(4)</sup>	$V_{CCI} = 1.65 \text{ V to } 4.5 \text{ V}$	$V_{CCI} \times 0.65$	V
			$V_{CCI} = 2.3 \text{ V to } 2.7 \text{ V}$	1.7	
			$V_{CCI} = 3 \text{ V to } 3.6 \text{ V}$	2	
			$V_{CCI} = 4.5 \text{ V to } 5.5 \text{ V}$	$V_{CCI} \times 0.7$	
$V_{IL}$	Low-level input voltage <sup>(1)</sup>	Data inputs <sup>(4)</sup>	$V_{CCI} = 1.65 \text{ V to } 4.5 \text{ V}$	$V_{CCI} \times 0.35$	V
			$V_{CCI} = 2.3 \text{ V to } 2.7 \text{ V}$	0.7	
			$V_{CCI} = 3 \text{ V to } 3.6 \text{ V}$	0.8	
			$V_{CCI} = 4.5 \text{ V to } 5.5 \text{ V}$	$V_{CCI} \times 0.3$	

- (1)  $V_{CCI}$  is the  $V_{CC}$  associated with the data input port.
- (2)  $V_{CCO}$  is the  $V_{CC}$  associated with the output port.
- (3) All unused control inputs of the device must be held at  $V_{CCA}$  or GND to ensure proper device operation and minimize power consumption. See *Implications of Slow or Floating CMOS Inputs*, [SCBA004](#).
- (4) For  $V_{CCI}$  values not specified in the data sheet,  $V_{IH \text{ min}} = V_{CCI} \times 0.7 \text{ V}$ ,  $V_{IL \text{ (max)}} = V_{CCI} \times 0.3 \text{ V}$ .

## 8 Detailed Description

### 8.1 Overview

The SN74LVCH8T245 is an 8-bit, dual supply noninverting voltage level translator. Pins A1 through A4, and the control pins (DIR and  $\overline{OE}$ ) are referenced to  $V_{CCA}$ , while pins B1 through B4 are referenced to  $V_{CCB}$ . Both the A port and B port can accept I/O voltages ranging from 1.65 V to 5.5 V. The high on DIR allows data transmission from Port A to Port B, and a low on DIR allows data transmission from Port B to Port A. See *AVC Logic Family Technology and Applications* (SCEA006).

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Fully Configurable Dual-Rail Design

Both  $V_{CCA}$  and  $V_{CCB}$  can be supplied at any voltage from 1.65 V to 5.5 V, making the device suitable for translating between any of the voltage nodes: 1.8 V, 2.5 V, 3.3 V and 5 V.

#### 8.3.2 Partial-Power-Down Mode Operation

$I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down. This can occur in applications where subsections of a system are powered down (partial power down) to reduce power consumption.

#### 8.3.3 Active Bus Hold Circuitry

Active bus-hold circuitry holds unused or undriven inputs at a valid logic state, which helps with board space savings and reduced component costs. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

#### 8.3.4 Supports High-Speed Translation

The device can support high data rate applications, which can be calculated from the maximum propagation delay. This is also dependant on the output load. For example, for a 3.3-V to 5-V conversion, the maximum frequency is 200 MHz.

#### 8.3.5 $V_{CC}$ Isolation

The  $V_{CC}$  isolation feature ensures that if either  $V_{CCA}$  or  $V_{CCB}$  are at GND (or  $< 0.4$  V), both ports will be in a high-impedance state ( $I_{OZ}$  shown in *Electrical Characteristics*). This prevents false logic levels from being presented to either bus.

## 8.4 Device Functional Modes

Table 1 lists the functional modes of the SN74LVCH8T245.

**Table 1. Function Table (Each 8-Bit Section)**

CONTROL INPUTS <sup>(1)</sup>		OUTPUT CIRCUITS		OPERATION
$\overline{\text{OE}}$	DIR	A PORT	B PORT	
L	L	Enabled	Hi-Z	B data to A bus
L	H	Hi-Z	Enabled	A data to B bus
H	X	Hi-Z	Hi-Z	Isolation

(1) Input circuits of the data I/Os are always active.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The SN74LVCH8T245 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The maximum output current can be up to 32 mA when device is powered by 5 V.

### 9.2 Typical Application

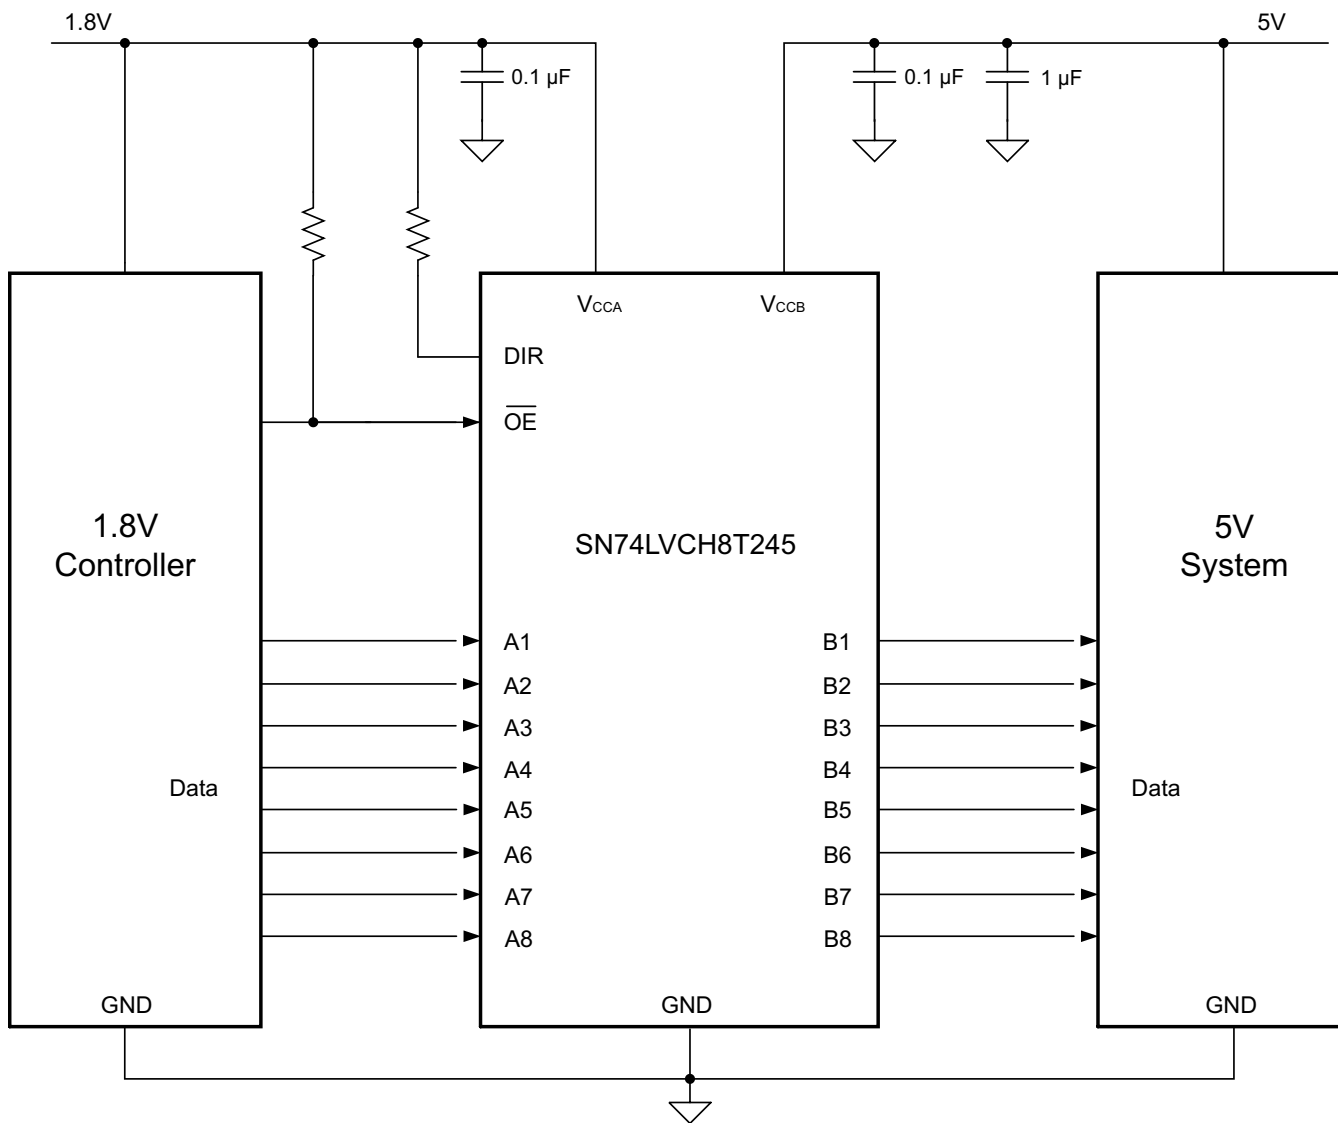

Figure 4. Typical Application Circuit

## Typical Application (continued)

### 9.2.1 Design Requirements

For this design example, use the parameters listed in [Table 2](#).

**Table 2. Design Parameters**

PARAMETERS	VALUES
Input voltage	1.65 V to 5.5 V
Output voltage	1.65 V to 5.5 V

### 9.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
  - Use the supply voltage of the device that is driving the SN74LVCH8T245 to determine the input voltage range. For a valid logic high, the value must exceed the  $V_{IH}$  of the input port. For a valid logic low, the value must be less than the  $V_{IL}$  of the input port.
- Output voltage range
  - Use the supply voltage of the device that the SN74LVCH8T245 is driving to determine the output voltage range.

#### 9.2.2.1 Enable Times

Calculate the enable times for the SN74LVCH8T245 using [Equation 1](#), [Equation 2](#), [Equation 3](#), and [Equation 4](#):

$$t_{PZH} \text{ (DIR to A)} = t_{PLZ} \text{ (DIR to B)} + t_{PLH} \text{ (B to A)} \quad (1)$$

$$t_{PZL} \text{ (DIR to A)} = t_{PHZ} \text{ (DIR to B)} + t_{PHL} \text{ (B to A)} \quad (2)$$

$$t_{PZH} \text{ (DIR to B)} = t_{PLZ} \text{ (DIR to A)} + t_{PLH} \text{ (A to B)} \quad (3)$$

$$t_{PZL} \text{ (DIR to B)} = t_{PHZ} \text{ (DIR to A)} + t_{PHL} \text{ (A to B)} \quad (4)$$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the device initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.

### 9.2.3 Application Curve

**Figure 5. Translation Up (1.8 V to 5 V) at 2.5 MHz**

## 10 Power Supply Recommendations

The output-enable ( $\overline{OE}$ ) input circuit is designed so that it is supplied by  $V_{CCA}$  and when the  $\overline{OE}$  input is high, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the  $\overline{OE}$  input pin must be tied to  $V_{CCA}$  through a pullup resistor and must not be enabled until  $V_{CCA}$  and  $V_{CCB}$  are fully ramped and stable. The minimum value of the pullup resistor to  $V_{CCA}$  is determined by the current-sinking capability of the driver.

$V_{CCA}$  or  $V_{CCB}$  can be powered up first. If the SN74LVCH8T245 is powered up in a permanently enabled state (for example  $\overline{OE}$  is always kept low), pullup resistors are recommended at the input. This ensures proper, glitch-free, power-up. See *Designing with SN4LVCXT245 and SN74LVCHXT245 Family of Direction Controlled Voltage Translators/Level-Shifters* (SLVA746). In addition, the  $\overline{OE}$  pin may be shorted to GND if the application does not require use of the high-impedance state at any time.

## 11 Layout

### 11.1 Layout Guidelines

To ensure reliability of the device, TI recommends the following common printed-circuit board layout guidelines.

- Bypass capacitors should be used on power supplies.
- Short trace lengths should be used to avoid excessive loading.
- Placing pads on the signal paths for loading capacitors or pullup resistors helps adjust rise and fall times of signals depending on the system requirements.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
